Boston

August Sales of Pig Iron are Record for Year—Scrap Market Continues to Gain Strength

BOSTON, Sept. 4.—Pig iron sales in New England the past week totaled slightly more than 8000 tons, making August business the largest for any month this year. The Mystic Iron Works alone sold 30,600 tons in August. Practically all sales made in the past week were in small lots, ranging from carloads up to 500 tons. Buffalo furnaces obtained \$17.50 a ton, furnace, and other New York State stacks and the Mystic Iron Works got better prices than heretofore. Alabama, western and eastern Pennsylvania, Indian and Dutch irons and a small amount of malleable were sold. Buffalo iron can still be bought at \$16 a ton, furnace, in large tonnages, but how much longer this quotation will hold good is uncertain. The Mystic Iron Works has obtained a reduction in rail freight rates from Everett, Mass., to Connecticut points competitive with Troy, N. Y., iron. The rate was \$3.30 a ton; it is now \$3.05.

Foundry iron prices per gross ton deliv'd to most New England points:

*Buffalo, sil. 1.75 to 2.25..	\$21.41 to \$21.91
*Buffalo, sil. 2.25 to 2.75..	21.91 to 22.41
†Buffalo, sil. 1.75 to 2.25..	20.23 to 20.78
†Buffalo, sil. 2.25 to 2.75..	20.78 to 21.28
East. Penn., sil. 1.75 to 2.25	23.15 to 23.65
East. Penn., sil. 2.25 to 2.75	23.65 to 24.15
Va., sil. 1.75 to 2.25.....	25.71
Va., sil. 2.25 to 2.75.....	26.21
Ala., sil. 1.75 to 2.25.....	23.16 to 25.02
Ala., sil. 2.25 to 2.75.....	23.66 to 25.52

Freight rates: \$4.91 all rail and \$3.78 rail and water from Buffalo; \$3.65 from eastern Pennsylvania; \$5.21 all rail from Virginia; \$6.91 to \$8.77 from Alabama.

*All rail rate. †Rail and water rate.

Coke.—The New England Coal & Coke Co. and the Providence Gas Co. have made no change in their price on by-product foundry coke for September delivery. It remains at \$11 a ton, delivered within a \$3.10 freight rate zone. These ovens did a larger foundry coke business last month than

in July, this year, but just about broke even with August, last year.

Shapes and Plates.—Specifications against third quarter shape and plate contracts increased noticeably during the latter part of August, and it is reported that shipments at less than 1.85c. per lb., base Pittsburgh, have been practically completed. The market for standard shapes and plates apparently is now steady at 1.90c. per lb. on desirable tonnages, and at 2c. per lb. for small lots.

Cast Iron Pipe.—The last week in August brought a decided slowing up in private pipe business. A Massachusetts municipality privately purchased 200 tons of 6 and 8-in. stock, the largest individual transaction reported. The Navy Department, Newport, R. I., has purchased 200 tons of 6 to 16-in. pipe from the Warren Foundry & Pipe Co. The National Cast Iron Pipe & Foundry Co. and R. D. Wood & Co. were the low bidders on 150 tons of 6 to 12-in. pipe for Camp Devens, Mass. Revere, Mass., closed bids Aug. 30 on 100 tons of 6 and 8-in. pipe, but has made no award. Prices are steady at \$45.10 to \$46.10 on 4-in., and at \$41.10 to \$42.10 on 6 to 12-in. pipe. Large pipe prices remain unsettled. The usual \$5 differential is asked on class A and gas pipe.

Old Material.—The movement of old material out of New England, espe-

cially into the Pittsburgh district, is gathering momentum, that for the past week being the largest for any similar period in months. Eastern Pennsylvania mills also are in a more receptive mood, but there has not been any material increase in shipments there. No. 1 heavy melting steel is now \$9.50 to \$10 a ton, on cars shipping point, compared with \$9.50 to \$9.75 a week ago. The bulk of current business is at \$9.75 to \$10 a ton. Specification pipe and steel mill borings are easily 50c. a ton higher, and T rails have recovered 25c. of the recent 50c. setback. Comparatively little machinery cast was taken by New England foundries the past week, presumably because of the recent activity in pig iron. The export market likewise was rather inactive, but this week may bring a resumption of buying.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel.	\$9.50 to \$10.00
Scrap T rails.....	8.25 to 8.75
Scrap girder rails.....	7.50 to 8.00

Birmingham

Advance in Pig Iron Prices Has Stimulated Market—Steel Prices Firm—Scrap More Active

BIRMINGHAM, Sept. 4.—Pig iron buying has been stimulated by the advance in price on Aug. 24 to \$16.25, base. Some consumers have contracted for the rest of the year at that figure. New business during the past week has been confined to local trade. Inquiries have increased and more interest is being shown in the market than in some time. Shipments continue heavy. The No. 2 Bessemer furnace of the Tennessee company, which had been producing recarburizing iron, was banked on Aug. 21. No other changes have been made. Sixteen furnaces are now in blast. Of this number, 12 are on foundry, three on basic and one on ferromanganese. Work will be completed the latter part of this month on the rebuilding of the Gulf States Steel Co. furnace at Alabama City.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil.....	\$16.25
No. 1 fdy., 2.25 to 2.75 sil.....	16.75
Basic.....	16.25

Finished Steel.—The tonnage booked last month was unusually

large for August and exceeded that of July. Sheet specifications are placing a heavy demand on mills. Prices are firm and unchanged. The rod mill of the Gulf States Steel Co. is in full operation, having been down since July 15 for power change. Reinforcing bars show greater activity in awards, though individual lettings are small. Local demand for structural steel is light. Plants are keeping busy on recent orders. Only nine open-hearth furnaces in the district have been active since Aug. 22, the Tennessee company having six in operation at Fairfield and the Gulf States Steel Co. three at Alabama City.

Cast Iron Pipe.—The market has been quiet for several weeks. Makers are depending largely on private business to keep operations up to the average. Stocks on yards are being worked off as customers continue to demand prompt deliveries. Mobile, Ala., will open bids Sept. 4 on a fair-sized tonnage and Bonifay, Fla., has called bids for the same date for around 18,000 ft. of 6-in. pipe. Prices

show firmness, with quotations at \$34 to \$35 on 6-in. and larger sizes.

Coke.—The coke market shows a slight improvement with a little forward buying under way. Prices remain at \$5 for both spot and contract.

Old Material.—The market is steadily developing strength, following the unusually low period during the summer. An improved demand is noted in all lines. Railroad wrought has developed considerable activity during the week. Prices on No. 1 cast

have advanced another 50c. to \$15. No other changes have been made in quotations.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Buffalo

Pig Iron Orders Taken Just Prior to Price Advances Totaled 60,000 Tons

BUFFALO, Sept. 4.—Just prior to the recent price advances on pig iron, approximately 60,000 tons was booked by local makers, it is estimated. A considerable number of melters have not yet covered for fourth quarter and a continuance of the buying movement is expected. The American Radiator Co., whose furnace at Tonawanda is out for repairs, has been inquiring for foundry and malleable iron. The company's total requirements for all plants are upward of 30,000 tons. A central New York melter purchased 2000 tons of foundry and a Buffalo radiator manufacturer placed 1500 tons. Numerous 1000-ton lots were booked, the bulk of the buying centering in New York State. Makers say the present situation is the healthiest in years.

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil. 1.75 to 2.25..	\$17.00 to \$17.50
No. 2X fdy., sil. 2.25 to 2.75	17.50 to 18.00
No. 1X fdy., sil. 2.75 to 3.25	18.50 to 19.00
Malleable, sil. up to 2.25..	17.50 to 18.00
Basic.....	16.50 to 17.00
Lake Superior charcoal...	27.28

Finished Iron and Steel.—Operations are being maintained at about 90 per cent, with the outlook excellent. Bars, shapes and plates are firm, with the probability that a 2.10c. Buffalo price will be formally announced soon. New billet steel is being quoted at 2.415c., warehouse, and 2.515c., delivered at the job. Wire business is good and alloy steel mills report increasing business. One 300-ton reinforcing job, a garage, was awarded in the week.

Old Material.—The principal activity has been caused by dealers in covering old orders. Difficulty is being experienced, as there has been no accumulation of scrap in yards and, with

heavy operation by mills, the available supply is low. No further buying in volume has taken place since the No. 1 heavy melting steel purchases at \$13.75 and \$15 by two of the local mills. Some long rails have been bought at \$14.50. Small lots of knuckles and couplers have been sold at \$16 to \$16.50 and coil and leaf springs have brought \$16.50 to \$17. Stove plate is scarce; there have been a few sales at \$14. One of the mills

St. Louis

Pig Iron Buying Falls Off Following Price Advances—Steel Buying Continues at Active Pace

ST. LOUIS, Sept. 4.—Following the recent advances of 50c. a ton by the Granite City maker and of 75c. a ton by Southern interests, buying of pig iron in this market has fallen off. The St. Louis Gas & Coke Corporation sold 2600 tons of foundry iron, including 800 tons to a Springfield, Ill., specialty maker; 250 tons to a Louisville melter and 300 tons to a local melter. Sales of Southern iron were small. A Louisville company is in the market for 3000 tons of foundry iron for fourth quarter shipment; this is the only sizable inquiry in the market. The melt in the district is increasing, jobbing foundries and stove manufacturers showing greater activity. Shipments by the Granite City maker in August were ahead of any other August, and melters have agreed to take their full quotas for September.

Prices per gross ton at St. Louis:

Northern basic, deliv'd.....	20.16

Freight rates: 81c. Granite City to St. Louis; \$2.16 from Chicago; \$4.42 from Birmingham.

Finished Steel.—The Granite City Steel Co. has announced that it will adopt a discount for cash in 10 days of one-half of 1 per cent on all sheets shipped on and after Oct. 1. The discount will be allowed on the value of the material f.o.b. mill. The move by

the Granite City mill follows the example of virtually all of the leading producers of steel sheets. Galvanized sheets continue active, with a very noticeable tendency toward price stabilization. Orders for black sheets and tin mill black are reaching the Granite City mill in heavy volume, and it is several weeks behind in production. The tin plate situation is without change. Specifications reaching the Granite City Steel Co. are in large volume, and it is having difficulty in supplying the demand. While

plates are not especially active, there is a fair volume of miscellaneous requirements. August warehouse business will show a gain over that of the same month last year, St. Louis business showing gains and the oil fields a loss. Structural business is light.

Old Material.—Although consumers are buying very little old material and have given no indication as to when they will buy on any sizeable scale, the market continues to advance so far as dealers' prices are concerned. Dealers' advances are based on strength in the market elsewhere and on anticipated purchases by consumers. Lists of railroads in this section have been small, and shipments from country dealers light. Heavy melting steel, heavy shoveling steel, miscellaneous standard section rails, No. 1 and No. 2 railroad wrought, rails for rolling and steel angle bars are 25c. higher, while steel rails less than 3 ft. are 50c. higher, and No. 1 locomotive tires are 75c. higher. Rail-

road lists follow: Pennsylvania Lines, 41,175 tons; Big Four, 1250 tons; Missouri Pacific, 75 carloads; Frisco, 30 carloads; Mobile & Ohio, 26 carloads; St. Louis-Southwestern, 20 carloads.

Cincinnati

Greater Activity in Pig Iron—Scrap Market Gains Strength—Steel Demand Steady

CINCINNATI, Sept. 4.—With sales totaling about 12,000 tons and with buyers manifesting interest in covering requirements over the remainder of the year, the pig iron market has continued active for a second week. That the large users deem it advisable to make fourth quarter purchases now is indicated by the fact that bookings in the past few days have included orders for 3500 tons, 1500 tons and 1200 tons. One of the main developments has been the sizable sales of Jackson County silvery iron, one local dealer reporting transactions totaling 1500 tons. Prices continue to show a firm tendency. Northern Ohio furnaces are quoting No. 2 foundry iron at \$20.40, delivered in Cincinnati, although attractive tonnages probably can be obtained at 50c. a ton less. Two Iron-ton, Ohio, sellers have been quietly disposing of small lots of foundry iron from their yard stocks at prices which are reported to range from \$17 to \$18, base furnace. Little Southern iron has been sold since the recent advance in quotations became effective.

Prices per gross ton, deliv'd Cincinnati:

So. Ohio fdy., sil. 1.75 to	
2.25.....	\$18.89 to \$19.89
So. Ohio malleable.....	20.14 to 20.89

Ala. fdy., sil. 2.25 to 2.75...	20.44
Tenn. fdy., sil. 1.75 to 2.25	19.69
So'th'n Ohio silvery 8 per cent.....	26.89

Freight rates, \$1.89 from Ironton and Jackson, Ohio; \$3.69 from Birmingham.

Finished Material.—Sheet steel companies in August booked considerably more business than in July, a prominent district mill reporting an increase of approximately 40 per cent. Orders and specifications have been

well distributed among consuming industries, although automobile manufacturers have been the largest buyers. A sheet maker nearby has announced the following prices for the fourth quarter: black sheets, 2.85c., base Pittsburgh; blue annealed, 2c.; long terme, 4c. for primes with seconds assorted; and automobile body stock, 4c. These quotations also are being adhered to for current business, although practically all contract customers are covered through the present quarter at 2.75c. for black and 1.90c. for blue annealed. This company has about a three weeks' backlog for its various plants, which are operating at 100 per cent of capacity. Bars, plates and shapes are quoted at 1.90c., base Pittsburgh, for spot orders and 2c. for fourth quarter contract tonnage. Agricultural implement manufacturers have a large volume of unfilled orders and consequently are running at full capacity, their

4-in.....	39.00

steel requirements amounting to an appreciable tonnage. Fabricators are fairly busy on numerous small jobs, but have little work ahead. The wire market is rather quiet, with prices firm. A producer of cold-rolled strip steel has announced quotations of 2.85c., base Pittsburgh, for fourth quarter.

Coke.—The price of by-product foundry coke will remain at \$7 per net ton, f.o.b. ovens, or \$9.14, delivered Cincinnati, during September. The schedule for domestic grades is \$4.50, ovens, for egg size and \$3.50 for walnut. At Detroit, by-product foundry coke is selling at a delivered price of \$9 to local users and at \$10 to outside consumers. Specifications for by-product foundry coke have been liberal and indications are that shipments this month will be satisfactory in volume. New River beehive foundry coke is steady at \$6.50 to \$7, ovens.

Old Material.—The scrap market shows increasing signs of strength and dealers are willing to pay more for material than a few weeks ago. As a consequence, heavy melting steel is up 75c. a ton and many other items have advanced 50c. or 75c. District steel plants are taking sizeable tonnages on current contracts and also have bought a fair amount of scrap. Railroad lists closing this week include the Norfolk & Western, 6000 tons; Big Four, 3000 tons, and Chesapeake & Ohio, a special offering of 1200 tons.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel.....	\$11.75 to \$12.25
Scrap rails for melting....	11.50 to 12.00
Loose sheet clippings.....	9.00 to 9.50
Bundled sheets.....	9.50 to 10.00
Cast iron borings.....	8.25 to 8.50
Machine shop turnings....	8.00 to 8.50
No. 1 busheling.....	10.50 to 11.00
No. 2 busheling.....	6.00 to 6.50
Rails for rolling.....	13.00 to 13.50
No. 1 locomotive tires....	12.75 to 13.25
No. 2 railroad wrought...	11.00 to 11.50
Short rails.....	15.75 to 16.25
Cast iron carwheels.....	11.50 to 12.00
No. 1 machinery cast....	15.50 to 16.00
No. 1 railroad cast.....	13.00 to 13.50
Burnt cast.....	8.00 to 8.50
Stove plate.....	8.25 to 8.75
Brake shoes.....	9.50 to 10.25
Railroad malleable.....	11.50 to 12.00
Agricultural malleable ...	10.50 to 11.00

The supervisory and executive staffs of the Interstate Iron & Steel Co., Chicago, have been provided with group life insurance exceeding \$350,000. The plan is being underwritten on a cooperative basis, the employer sharing the cost with its employees. Each participating supervisor receives \$5,000 of life insurance and each executive \$7,000. Included in each contract are total and permanent disability benefits.

The United States Civil Service Commission, Washington, announces an open competitive examination for junior patent examiner to fill vacancies in the Patent Office, Washington. Application must be made prior to Oct. 10.

Youngstown Industries Defend Rail Spur

Reply to Trunk Line Carriers' Objections Brings Out Plans of Sheet and Tube Company to Utilize Projected Road

WASHINGTON, Sept. 4.—A reply was filed last Saturday with the Interstate Commerce Commission to exceptions of trunk line carriers to the proposed report of Assistant Director C. V. Burnside, which recommended that the commission give the Pittsburgh, Lisbon & Western Railroad permission to establish a new rail route between Smith's Ferry, Pa., and the Youngstown district, giving Youngstown rail connection with the Ohio River.

The declaration is made in the answer that industrial control of the proposed railroad by the Pittsburgh Coal Co. does not violate the commodities clause. It is asserted that the commission has many times granted certificates to industrially owned carriers, even where the prospective tonnage was to be furnished largely by the controlling industry. The answer also declared to be without merit the contention of the trunk line carriers, the Pittsburgh & Lake Erie, the Pennsylvania and the Baltimore & Ohio, that the ownership and operation by the Pittsburgh Coal Co. of the river terminal facilities at Smith's Ferry will give rise to "injustice to the shipping public." It was pointed out that a river coal transfer terminal would cost about \$250,000 and that the Youngstown Sheet & Tube Co. and the Pittsburgh Coal Co. each contemplate the erection of such a terminal should the proposed construction be authorized. The proposed practice at Smith's Ferry, it was asserted, is exactly in accord with the rule on the river. Contrary to the trunk lines' contention, the answer said, the Youngstown Sheet & Tube Co. and the Pittsburgh Coal Co. have by no means preempted the river front at Smith's Ferry. It was shown, the answer declared, that other lands both east and west of the Little Beaver River at Smith's Ferry are accessible to the proposed Lisbon line and available to the public.

Sheet & Tube Company's Plans

It is the intention of the Youngstown Sheet & Tube Co., it was pointed out, to construct not only a river-to-rail coal transfer at Smith's Ferry, but also a rail-to-river steel transfer. Other Youngstown shippers, with no definite plans at the moment as to how they will use the river-and-rail route, nevertheless support the project, expecting that the future will more definitely develop its service for them, it was stated. The Lisbon must and does encourage the development of river transfer terminals, it was declared, because the financial success of the project depends upon the development of river-and-rail and rail-and-river tonnage. The claim that the Pittsburgh Coal Co. will monopolize river transportation with its private craft is declared to be entirely

groundless by the applicant, which pointed out the large number of craft operated on the river by steel and other companies of the Pittsburgh and Wheeling districts.

Lower Coal Rates Contemplated

The answer also said that the trunk lines are entirely in error in the view that back of the proposal is a desire to overcome the effect of the commission's condemnation of the assembling cost theory of rate making. The Pittsburgh Coal Co., it was pointed out, is not concerned one way or another in the assembling cost theory, and the Youngstown iron and steel manufacturers who intervened in the case gave no evidence to indicate these proposals were supported by them in the belief that the assembling cost basis of rates would be revised. Attack is made on the trunk lines for assuming that the Lisbon will have an average rate on coal of 60c. per ton between Smith's Ferry and Youngstown. The answer said the Lisbon did present a probable future income amount wherein it was contemplated that, as extended, its total freight business would earn an average rev-

enue of 60c. per ton. What was contemplated, it was stated, was that coal from Smith's Ferry to Youngstown would probably pay a rate within the range of 50c. to 75c. per ton.

Replying to the charge of the trunk lines that the applicant is merely planning to divert a substantial tonnage from existing lines, the answer said:

The real "plan" here is to utilize a Government waterway, the effective use of which is impossible under the long established policy and practice of existing railroads. That some tonnage would be diverted from the existing railroads is true; it would doubtless be admitted even by the trunk lines that our inland waterways would handle no more than the figurative plug-hatful of business, were they to be denied all that the existing railroads can handle.

The refusal of the railroads, including the trunk lines, the answer said, voluntarily to establish joint river-and-rail rates with water lines in the past has compelled Congress to legislate as it did in the barge line bill, "but that is obviously no reason why a railroad that seeks to establish its business as part and parcel of the Government waterway routes should not be granted the right so to do." The Denison or barge line bill excepted the Ohio River system from certain provisions of that bill that seek to extend the common carrier service of the Government barge line.

Wood Underframes For Railroad Cars To Be Banned

Notice has been given by the arbitration committee of the American Railway Association that, effective Jan. 1, 1929, a new rule will be adopted which will bar existing wood underframes in cars in interchange between roads after Jan. 1, 1931. It is stated that this rule may have to be extended if it is found at that time that too many wood underframes are then in use. Two years ago this committee adopted a ruling that steel underframes would be required on all cars built new on or after Jan. 1, 1927.

Luxemburg Steel Production Exceeds Quota by 55,166 Tons

Production of pig iron and steel in the Grand Duchy of Luxemburg during the first six months of 1928 showed an increase over the output for the corresponding period of last year, according to a report prepared by James E. Parkes, vice-consul in Luxemburg. Pig iron produced during this period totaled 1,381,223 metric tons, a gain of 73,225 tons over the 1,307,998 produced during the first six months of 1927. Raw steel production increased 100,396 tons, amounting to 1,270,576 tons as compared with 1,170,180 tons. Iron ore

production decreased to 3,560,412 tons from 3,676,180 tons.

The report points out that, considering that Luxemburg is a member of the Continental Steel Entente, the figures covering the output of steel take on particular significance in so far as surplus production over the allotted tonnage is concerned, since penalties must be paid for overproduction. According to arrangements recently entered into by members of the entente, beginning with the third quarter of 1928, a transgression of the allotted tonnage by 7.5 per cent is to be punishable at the rate of \$1 a ton; 7.5 to 10 per cent, \$2 a ton and over 10 per cent \$4 a ton. This latter amount was the penalty in force until the end of June for production over the allotted tonnage. The production quota allotted to Luxemburg amounted to 1,215,410 tons for the first half of 1928, and as this was exceeded by 55,166 tons the industry had to pay a fine of \$220,664.

Common stock of the Chain Belt Co., Milwaukee, has been made available to the public through new financing, and listed on the Chicago Stock Exchange. Proceeds of the sale of additional shares of common stock will be used to retire all preferred stock, and the 120,000 shares of common stock to be outstanding will represent the company's entire capitalization. Stock is being offered at \$41 a share and has been placed on a \$2.50 annual dividend basis.

Non-Ferrous Metal Markets

Copper Quiet and Steady, Tin Active and Higher, Lead and Zinc Un- changed

Copper.—Domestic copper sales were heavier in August than foreign sales but the total probably was less than that of some previous months. Practically all of the domestic consumers have contracted for their September requirements, but foreign users still have considerable nearby metal to purchase. The last week of August was only moderately active. Sales of October metal have been light thus far. September opens with foreign sales quite large, but with very little activity in the domestic market. Prices continue very firm at the levels which have prevailed since late in

Metals from New York Warehouse

Delivered Prices Per Lb.

Tin, Straits pig.....	49.00c. to 50.00c.

*Refinery quotation; delivered price ¼c. higher.

May: Electrolytic copper at 14.75c., delivered in the Connecticut Valley, at 14.87½c., delivered in the Central West, and at 15c. c.i.f. European ports as the official quotation of Copper Exporters, Inc. Lake copper is quiet but firm at 14.75c. to 14.87½c., delivered.

Copper Averages.—The average price of Lake copper for August, based on daily quotations in THE IRON AGE, was 14.75c., delivered. The average price of electrolytic copper was 14.50c., refinery, or 14.75c., delivered in the Connecticut Valley.

Tin.—Last week was again very active, total sales to Saturday, Sept. 1, having been about 2000 tons. Consumers bought liberally and dealers were active, each taking about half of the total. September-October deliveries were principally involved and there is more interest in November-December. Statistics for August show that the Straits shipments were

very large at 9309 tons and that the visible supply at the end of the month was 18,456 tons, an increase of 434 tons since July 31, which is less than was expected. American deliveries into consumption were 7200 tons, or larger than the early estimates. There was 1718 tons in stock and landing on Aug. 31. The market here today has been quiet, with spot Straits tin quoted at 48c., New York. In London, quotations today were higher than a week ago, with spot standard quoted at £213 10s., future standard at £210 and spot Straits at £216 15s. The Singapore price today was £213 5s.

Lead.—Sales of lead were fairly large in the last week and the total for August was heavy. Prices were advanced twice in the past month and continue very firm. The quotation of the leading interest is unchanged at 6.40c., New York, while prices in the outside market range from 6.22½c.

Non-Ferrous Rolled Products

Mill prices on bronze, brass and copper products are unchanged. Zinc sheets are still being quoted at 9.75c., base, and lead full sheets at 10c. to 10.25c.

List Prices, Per Lb., f.o.b. Mill

On Copper and Brass Products, Freight up to 75c. per 100 Lb. Allowed on Shipments of 500 Lb. or Over

Sheets—	
High brass	19.25c.
Copper, hot rolled	23.50c.
Zinc	9.75c.
Lead (full sheets).....	10.00c. to 10.25c.

Seamless Tubes—	
High brass	24.12½c.
Copper	25.00c.

Rods—	
High brass	17.00c.
Naval brass	19.75c.

Wire—	
Copper	16.75c.
High brass	19.75c.
Copper in Rolls.....	22.50c.
Brazed Brass Tubing.....	27.25c.

Aluminum Products in Ton Lots

The carload freight rate is allowed to destinations east of Mississippi River and also to St. Louis on shipments to points west of that river.

Sheets, 0 to 10, gage, 3 to 30 in. wide	33.00c.
Tubes, base	42.00c.
Machine rods	34.00c.

Old Metals, Per Lb., New York

Buying prices represent what large dealers are paying for miscellaneous lots from smaller accumulators and selling prices are those charged customers after the metal has been properly prepared for their uses.

	Dealers' Buying Prices	Dealers' Selling Prices
Copper, hvy. crucible	12.625c.	14.00c.
Copper, hvy. and wire	12.50c.	13.50c.

to 6.25c., St. Louis, all for September-October delivery.

Zinc.—Following the holidays, this market, like the others, was inactive but firm on Tuesday. The feature for some weeks has been the firmness of prices which continue at 6.25c., East St. Louis, or 6.60c., New York, for prime Western through October. Producers report a satisfactory business for August and state that the month will compare favorably with recent ones as to total business.

Antimony.—Chinese metal is a little easier at 10.12½c., New York, duty paid, for all positions.

Nickel.—Wholesale lots of ingot nickel are quoted at 35c. with shot nickel at 36c. and electrolytic nickel at 37c. per lb.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is quoted at 23.90c., per lb., delivered.

Non-Ferrous Metals at Chicago

CHICAGO, Sept. 4.—Purchases of non-ferrous metals are small and few in number. Prices for tin and lead have advanced. The old metal market is dull.

Prices, per lb., in carload lots: Lake copper, 15.25c.; tin, 49c.; lead, 6.40c.; zinc, 6.35c. in less-than-carload lots, antimony, 12c. On old metals we quote copper wire, crucible shapes and copper clips, 10.75c.; copper bottoms, 9.75c.; red brass, 9.50c.; yellow brass, 7.25c.; lead pipe, 4.75c.; zinc, 3.50c.; pewter, No. 1, 30c.; tin foil, 36.25c.; block tin, 45.25c.; aluminum, 12c.; all being dealers' prices for less-than-carload lots.

Large Increase in Telephone Long Distance Lines

An additional expenditure of \$11,042,000 for construction of long distance telephone facilities during 1928 has been authorized by the American Telephone & Telegraph Co., according to announcement by T. G. Miller, general manager of the long lines department of that company. Most of the material required will be furnished by the Western Electric Co., which has arrangements under way for an extensive increase in plant facilities to keep pace with the enlarged construction program.

The additional appropriation brings the total for new construction this year to \$49,038,000, compared with \$36,406,000 expended during 1927, the previous record year in construction. About \$32,400,000 will be spent on additions and extensions to long distance lines and more than \$12,000,000 for central office equipment used in connection with long distance calls. Estimates at the beginning of 1928 called for 1367 miles of new telephone cable construction, and this estimate is now increased to 1600 miles planned for completion by Dec. 31.

About \$4,000,000 will be required for additional aerial wire circuits through the less populated sections. A considerable sum will be used for installing virtually stormproof cables

between all important centers. Radio program transmission circuits to supplement those already in use are also to be provided.

During the first half of 1928, as compared with the same period in 1927, telephone users increased their use of the long distance circuits of the American Telephone & Telegraph Co. an average of 20 per cent.

Stock Sizes of Turnbuckles Reduced from 248 to 115

Stock sizes of turnbuckles adopted by a general conference of representative manufacturers, distributors and users, held Oct. 19, 1927, for promulgation by the United States Department of Commerce are given in Simplified Practice Recommendation R71-28. The simplification as approved by the conference cuts the number of turnbuckles manufactured from 248 to 115.

The recommendations cover turnbuckles with and without stubs, and turnbuckles with hook, eye and jaw ends. They are to be effective from Jan. 1, 1928, for new production and April, 1928, for the clearing of existing stocks and are subject to annual revision by a conference of the standing committee of the industry. Copies of the simplified practice recommendation may be obtained from the Superintendent of Documents, United States Government Printing Office, Washington. The price is 5c.

Sharp Reduction in Machinery Imports Into Italy

WASHINGTON, Sept. 1.—Imports of machinery into Italy during 1927 showed an abrupt decline when compared with 1926 and 1925, according to A. A. Osborne, commercial attaché at Rome. During the past three years Germany has supplied approximately one-half of the machinery imported into Italy, but suffered in 1927 a decrease of 41 per cent as compared with 1926 and 36 per cent as compared with 1925. The United States, which supplies only 8 per cent of the tonnage and 12 per cent of the value of the machinery imported into Italy, lost 36 per cent in tonnage and more than 41 per cent in value as compared with 1926 and 17 per cent in tonnage and 37 per cent in value as compared with 1925.

Imports entering Italy under the classification "Machinery, Apparatus and Parts," including industrial machinery, agricultural machinery, sewing machines, electrical machinery and typewriters, amounted to 74,448 metric tons in 1927, with a total value of about \$35,637,000, against 114,083 tons, valued at \$42,437,000, in 1926. The loss in 1927 was 35 per cent in tonnage and nearly 37 per cent in value when compared with 1926.

Importations of strictly industrial machinery showed decreases in practically all classes, owing to the industrial depression which began in 1926

and continued throughout the following year. The three leading classes of industrial machinery entering Italy, machine tools, spinning machinery and weaving equipment, suffered particularly heavy declines. The total tonnage of machine tools imported in 1927 represented only 53 per cent of the imports of 1926 and 40 per cent of the trade of 1925. Imports of spinning machinery in 1927 were only 41 per cent and weaving machinery 35 per cent as great as the imports of 1926, and 36 and 26 per cent respectively of the imports of 1925.

Hardware Testing Laboratory in Germany

HAMBURG, GERMANY, Aug. 18.—An inspecting and testing laboratory for the German hardware industry, which has been planned for several months, has been established and will open in November. The laboratory is financed by the hardware industry, but outsiders may have material tested for a moderate fee. Modern testing equipment has been purchased, including a few testing machines from the United States.

Obituary

JOSEPH ANDREW JEFFREY, chairman of the board of the Jeffrey Mfg. Co., Columbus, Ohio, died at his home in that city on Aug. 27. He was one of the founders of the company bearing his name and served as its active head until his partial retirement in 1922. He was in his ninety-second year. Mr. Jeffrey was born at Clarksville, Clinton County, Ohio, and after attending the schools of Clinton and Auglaize counties he went to Columbus and engaged in the banking business, having been one of the founders of the Commercial National Bank. He became associated with Francis Lechner in 1877 in the manufacture of mining machinery and six years later disposed of his banking interests to devote his entire time to manufacturing. The company became the Jeffrey Mfg. Co. in 1887. Robert H. Jeffrey, a son, is president and general manager of the company, and two other sons, Joseph W. and Malcolm D. are vice-president and assistant sales manager respectively.

JOSEPH C. GASKILL, vice-president of the Pierce, Butler & Pierce Mfg. Corporation and general manager of its Ames plant at Oswego, N. Y., died at his home in that city on Aug. 30, after an illness of two weeks, aged 52 years. He was born at Mount Holley, N. J., and had been identified with the Ames plant for 35 years.

WILLIAM H. EVANS, secretary-treasurer of the Illinois Pure Aluminum Co., Lemont, Ill., died on Aug. 18, following a week's illness. He had been associated with the company for 18 years.

Fabricated Structural Steel

Awards of 30,000 Tons and Only 15,200 Tons in New Projects Up for Bids

FABRICATED structural awards, amounting to slightly more than 30,000 tons, were considerably less than the weekly average during August. The largest jobs were a railroad bridge at Newark, N. J., calling for 6200 tons, and an office building in New York which took 4500 tons. New projects, totaling only 15,200 tons, included 3300 tons for four public schools in New York and 3000 tons for an office building in Chicago. Awards follow:

BOSTON, 250 tons, Back Bay station, to New England Structural Co.

EASTHAMPTON, MASS., 195 tons, State bridge, to an unnamed fabricator.

NEW YORK, 4500 tons, Herald Square Building, to Taylor-Fichter Steel Construction Co.

NEW YORK, 1200 tons, two apartment buildings for Bing & Bing, Inc., to Taylor-Fichter Steel Construction Co.

NEW YORK, 800 tons, column cores for Packard service station in West Fifty-fourth Street, to McClintic-Marshall Co.

NEW YORK, 700 tons, apartment building in Park Avenue, to Hedden Iron Construction Co.

NEW YORK, 625 tons, Dugan Brothers bakery building in Queens, to National Bridge Works.

NEW YORK CENTRAL RAILROAD, 750 tons, two bridges; 500 tons at Cleveland, to Mount Vernon Bridge Co., and 250 tons at Nepperhan, N. Y., to Fort Pitt Bridge Works.

NEWARK, 6200 tons, bridge over Newark Bay for Pennsylvania and Lehigh Valley railroads, divided equally between American Bridge Co. and Bethlehem Steel Co.

STANDARD OIL CO. OF NEW JERSEY, 1000 tons, 10 tanks in Texas, to unnamed fabricator.

STATE OF NEW JERSEY, 150 tons, bridge at Cape May, to Phoenix Bridge Co.

PHILADELPHIA, 600 tons, building for the Congoleum Co., to American Bridge Co. MARCUS HOOK, PA., 400 tons, warehouse for Congoleum-Nairn, Inc., to Lackawanna Steel Construction Co.

BALTIMORE & OHIO RAILROAD, 800 tons, bridge at Chicago, to American Bridge Co.

PONTIAC, MICH., tonnage not stated, foundry for Oakland Motor Co., to Mahon Structural Steel Co., Detroit.

FERNDALE, MICH., 990 tons, factory for Steel & Tubes, Inc., to Whitehead & Kales Co.

HAMILTON, ONT., 300 tons, apartment building on Ottawa Street, to Hamilton Bridge Co.

MIDDLETOWN, OHIO, 950 tons, warehouse for American Rolling Mill Co., to McClintic-Marshall Co.

INDIANAPOLIS, 1300 tons, Methodist Hospital, to Insley Mfg. Co., Indianapolis.

CHICAGO, 250 tons, building for Industrial Mfg. Co., to Butler Street Foundry, local.

CHICAGO, 330 tons, building for Spiegel, May, Stern Co., to New City Iron Works, local.

CHICAGO, 208 tons, garage at 925 Fair Oaks Street, to Midland Structural Steel Co.

CHICAGO, HEIGHTS, ILL., 250 tons, school, to A. Bolter's Sons, Chicago.

CHICAGO, 100 tons, building for Igoe Printing Co., to Hansell-Elcock Co., local.

CHICAGO, 1900 tons, mill building for Interstate Iron & Steel Co., to Worden Allen Co., Milwaukee.

QUINCY, ILL., 3000 tons, bridge across Mississippi River, to the American Bridge Co.

ROCKFORD, ILL., 250 tons, factory building, to Midland Structural Steel Co., Chicago.

BYRON, ILL., 1000 tons, bridge for Chicago,

Milwaukee, St. Paul & Pacific Railroad, to American Bridge Co.

MAUPIN, ORE., 170 tons, bridge over Deschutes River; general contract to Kuckenberg & Wittman, steel to an unnamed fabricator.

OLYMPIA, WASH., 444 tons, Nungent bridge; general contract to Ward Construction Co., steel to an unnamed fabricator.

OAKLAND, CAL., 860 tons, apartment building at Bellevue and Staten Avenues, to Pacific Coast Engineering Co.

VERNON, CAL., 200 tons plates, small tanks for Swift & Co., to Lacey Mfg. Co.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

NORTH EASTON, MASS., 200 tons, Ames Shovel & Tool Co. plant.

REINFORCING STEEL

Atlantic City Hotel Addition Takes 2300 Tons

INCLUDING 2300 tons for an addition to an Atlantic City hotel, reinforcing bar awards reported to THE IRON AGE during the last week amounted to 6800 tons. New projects calling for 3900 tons, included no jobs of outstanding size. Awards follow:

BURNHAM JUNCTION, ME., 150 tons, power house for Central Maine Power Co.; from Ambursen Construction Co., general contractor, to Truscon Steel Co.

NEW YORK, 100 tons, bakery building for Dugan Brothers, Inc., to McClintic-Marshall Co.

ATLANTIC CITY, N. J., 2300 tons, Haddon Hall extension, to Jones & Laughlin Steel Corporation.

PHILADELPHIA, 250 tons, Strawbridge & Clothier Co. department store, to Jones & Laughlin Steel Corporation.

PHILADELPHIA, 100 tons, Penn Hospital, to Jones & Laughlin Steel Corporation.

BUFFALO, 300 tons, Genesee Motoramp garage, to a local maker.

CLEVELAND, 450 tons, medical arts and other buildings for Cleveland Union Terminal, to Truscon Steel Co.

CLEVELAND, 100 tons, Randolph exchange, for Ohio Bell Telephone Co., to Bourne-Fuller Co.

STATE OF WISCONSIN, 300 tons, miscellaneous work, to Concrete Engineering Co.

CHICAGO, 900 tons of rail and billet steel bars for Sheridan Towers, to an unnamed bidder.

CHICAGO, 800 tons, flume on Western Avenue, to Barton Spiderweb System, Inc.

ROCKFORD, ILL., 200 tons, store and office building, to Olney J. Dean & Co.

RIVERSIDE, ILL., 250 tons of rail steel bars for bridge across Desplaines River, to Inland Steel Co.

ST. LOUIS, 200 tons, Alabama Avenue bridge over River Des Peres, to Laclede Steel Co.

BOSTON, 150 tons, Woolworth Co. store, Tremont Street and Hamilton Place.

BOSTON, 104 tons, bank building on Newbury Street.

STATE OF VERMONT, 200 tons, highway bridge.

NEW YORK, 3300 tons, four public schools; 1000 tons in No. 227, 700 tons in No. 12, 750 tons in No. 200 and 750 tons in No. 94.

NEW YORK, 200 tons, Government barracks on Governor's Island.

BROOKLYN, 150 tons, incinerator plant.

PHILADELPHIA, 1000 tons estimated, 25-story addition to Lewis building; bids being taken by contractors.

TORONTO, 1000 tons, for National Life Assurance Co. of Canada.

TORONTO, 2500 tons, for Bayview Avenue bridge over Don River.

ARNPRIOR, ONT., 500 tons for bridge and dam.

STATE OF ILLINOIS, 500 tons, highway bridges.

CHICAGO, 3000 tons, Patterson Estate building; general contract awarded to Hegeman Harris Co.

GRAND FORKS, N. D., 1200 tons, bridge.

KANSAS CITY, MO., 2000 tons, Professional Building.

TACOMA, WASH., 174 tons plates, 51 to 54-in. riveted pipe line; bids opened.

ELLENSBURG, WASH., 105 tons, canal, south branch of Kittitas project, to an unnamed interest.

MAUPIN, ORE., 160 tons, Deschutes River bridge; general contract to Kuckenberg & Wittman, steel to an unnamed interest.

Reinforcing Bars Pending

NEW YORK, unstated tonnage, Packard service station at Fifty-fourth Street and Eleventh Avenue.

BROOKLYN, 500 tons, plant for Brooklyn Ash Removal Co., Inc.

TORONTO, 500 tons of bars for Bayview Avenue bridge over Don River.

ARNPRIOR, ONT., 200 tons of bars for bridge and dam.

CHICAGO, 600 tons, store and office building at Grand Avenue and Michigan Boulevard; Dilks Construction Co., general contractor.

CHICAGO, 122 tons, Nurses Home for city. CHICAGO, tonnage not stated, armory for 124th Field Artillery.

CHICAGO, 600 tons, apartment building at 507 Oakdale Avenue; Maurice L. Bein, architect.

CHICAGO, 550 tons, apartment building at 1032 North Dearborn Street; Maurice L. Bein, architect.

CHICAGO, 600 tons, hotel at 1234 South Wabash Avenue; Maurice L. Bein, architect.

ST. LOUIS, 200 tons, addition to St. Mary's Hospital.

Railroad Equipment

Texas Co. has ordered one six-wheel switching locomotive from Baldwin Locomotive Works.

Pennsylvania Railroad is building 10 4-6-0 type passenger locomotives for service on Long Island at its Altoona, Pa., shops.

Southern Pacific is in market for 25 dining cars.

Chesapeake & Ohio is inquiring for two steel dining cars.

Solvay Process Co., Syracuse, N. Y., has ordered two 0-4-0 type tank locomotives from American Locomotive Co.

Mileage Scale Would Concentrate Industry

Would Draw Manufacturing Consumers Closer to Steel-Making Centers, Say Chicago Producers

CHICAGO, Sept. 4.—That increases in short-haul freight rates on iron and steel and the elimination on short hauls of groups of origin and destination, as outlined in the proposed mileage scale recommended by the Interstate Commerce Commission, will tend to draw industry nearer centers of iron and steel production is the belief of Illinois interests. It is contended that the present spread of industry is the result of the application of freight rates to groups, which have been established in Illinois in one form or another for 50 years or more. Under the proposed mileage scale, origin grouping would not be permitted for points of destination less than 150 miles distant and destination groups would not be allowed for points closer than 450 miles. This opens the way for the formation of groups in competitive territories, but denies the privilege on short hauls that fall within the district that local shippers claim as their natural territory and in which, they say, over 50 per cent of their iron and steel tonnage moves.

It is pointed out that on the short-haul point-to-point mileage scale industrial competitors in centers that are now grouped together would no longer be on a par with one another in the matter of freight charged on manufactured iron and steel. This, it is said, would lead to a slow but sure disintegration of these industrial centers, since manufacturers would find it to their advantage from a rate standpoint to move as close as possible to the sources of their supplies. With the shifting of industries would follow

losses of revenue to the railroads, not only because of the stoppage of manufactured iron and steel movements, but also on account of a decline in the movements of other commodities consumed by the smaller industrial centers. Thus the shippers are pointing out to the carriers that the group system of freight rate application in Illinois has spread industry to the advantage of the railroads, and that the retention of groups of origin and destination without regard to distance will forestall a concentration of manufacturing at points of iron and steel production.

Reviewing results that might be expected from the proposed scale, interests in Illinois and Indiana feel that the proposed mileage scale, if put into effect without modification, would result in heavy handicaps to Western shippers. It would eliminate groups in Illinois and Indiana on short hauls, it would decrease rates from Eastern centers of production into the Illinois-Indiana territory, and it would further decrease the long-haul rates by establishing groups of destination.

Would Aid Pittsburgh Mills

An analysis of the proposed scale for 31 points within a radius of 285 miles from Chicago shows that it would increase freight rates to 23 points. Considering the same points of destination with Pittsburgh as the point of origin, the point-to-point mileage scale would reduce 20 rates, raise six and leave five unchanged. To those points where the distance from Pittsburgh is more than 450 miles the

formation of groups would further reduce rates. With grouping applied, it would follow, according to local opinion, that four of the five unchanged rates from Pittsburgh would have their status altered so that they would be lower than under the Jones & Laughlin scale. Five of the six rates that are above those under the J. & L. scale without grouping applied might be expected, if groups were arranged, to be at least equal to the latter, making the new line-up from Pittsburgh to the 31 points of destination within a radius of 285 miles from Chicago as follows: Twenty-four rates would be lowered by the application of the mileage scale, six would remain unchanged and only one would be raised above the J. & L. scale.

St. Louis, a principal consuming point, is 279 miles from Chicago and 612 miles from Pittsburgh. Under the new plan Chicago producers can form an origin group but not a destination group. Pittsburgh, at a distance of more than 450 miles, may set up a destination grouping. The present rate from Chicago to St. Louis is 22c., and the proposed rate 25c. The present rate from Pittsburgh is 40½c., which would be reduced to 39c. on a point-to-point basis, or, as computed by some, 37c. if groupings were established. The present differential between Chicago and Pittsburgh with St. Louis as the destination is 18½c., while under the mileage scale this might be cut to 12c.

The table shows proposed and present freight rates on manufactured iron and steel from Chicago and Pittsburgh to 31 points in Illinois, Indiana, Michigan, Iowa, Missouri, Ohio and Wisconsin.

Stoker Sales Much Larger

July sales of mechanical stokers by the 12 leading manufacturers in the industry were 192, with 59,859 hp., compared with 166, with 43,212 hp., in June, according to the Department of Commerce. Of the July sales, 73 of the stokers, with 11,993 hp., were installed under fire-tube boilers, while 120, with 48,487 hp., were installed under water-tube boilers. For the first seven months 860 stokers, with 286,459 hp., were sold, against 865, with 318,403 hp., for the corresponding period of last year.

July was the heaviest month since August of last year, when sales totaled 60,977 hp. It compared with 41,504 hp. in July, 1927.

Orders were placed in July for 1615 steel boilers with 1,528,053 sq. ft. of heating surface, against 1611 with 1,469,617 sq. ft. in June, according to reports received by the Department of Commerce from 72 manufacturers. Orders in July of last year represented 1516 boilers with 1,777,598 sq. ft. Of the orders in July of the present year 1597 were for stationary boilers, with 1,478,034 sq. ft.

PERSONAL

J. R. LINNEY, vice-president Chateaugay Ore & Iron Co., Lyon Mountain, N. Y., will deliver an address on Chateaugay ore and the manufacture and use of Chateaugay pig iron, before the New England Foundrymen's Association at Boston, Sept. 12. His remarks will be illustrated by stereopticon views.

BENJAMIN F. FAUNCE has resigned as superintendent of the car department at the Cambria works, Bethlehem Steel Co., Johnstown, Pa., to devote his entire time to the Brown-Fayro Co., Johnstown, manufacturer of mining machinery. He has been succeeded by LINDSAY C. PRITNER, who has been assistant manager of the car department since 1916 and identified with the company for 37 years. Mr. Faunce has been with the Cambria plant since 1919 and was previously associated with a number of steel plants in western Pennsylvania. In 1921 he was one of the founders of the Fayro Machine & Engineering Co. and served as its president until its consolidation with the Brown Equipment Co. in 1925 when he became chairman of the board of the merged company.

ADOLPH RIDER, JR., has been appointed manager of the new Atlanta, Ga., office of the Lukens Steel Co., Coatesville, Pa.

CURTISS R. WATERS, formerly with the Cambria Clay Products Co., Black Fork, Ohio, is now associated with the Ferro Enameling Co., Cleveland.

RICHARD H. DANA, who has been vice-president and treasurer of Hodge & Dana, Inc., New York, is now associated with the Robins Conveying Belt Co., New York, and will specialize in the engineering and sale of vibrating screens.

HENRY D. SHARPE, president Brown & Sharpe Mfg. Co., Providence, R. I., who was formerly chairman of the foreign commerce advisory committee of the Chamber of Commerce of the United States, will continue to serve on that committee for the ensuing year. Mr. Sharpe represents foreign commerce on the chamber's board of directors and is also chairman of the civic development department advisory committee. Other members of the foreign commerce committee are HARRY A. BLACK, president Black Hardware Co., Galveston, Tex.; E. A. EMERSON, vice-president and general manager Armco International Corporation, Middletown, Ohio; JULIUS GOSLIN, president Joubert & Goslin Machine & Foundry Co., Birmingham; HENRY H. MORSE, sales export manager Florence Stove Mfg. Co., Boston; H. H. RICE, assistant to the president General Motors Corporation, Detroit; HAROLD F. SEY-

MOUR, vice-president Columbian Vise & Mfg. Co., Cleveland, and L. P. THAYER, vice-president International Harvester Co., Chicago.

C. E. PLUMMER has been appointed chief chemical and metallurgical engineer for the Robert W. Hunt Co., engineer, 2200 Insurance Exchange Building, Chicago. He was graduated in chemical engineering from the University of Michigan and received his master's degree in chemical and metallurgical engineering from the University of Minnesota. Recently he has been engaged in research work at the laboratories of the Union Carbide & Carbon Co., Long Island City, N. Y., and was previously associated with the Bureau of Mines and the Bureau of Standards.

W. W. RUNYON, formerly associated with the Max Solomon Co., Pittsburgh, has joined the Jay G. Stephens Corporation, Pittsburgh, which is engaged in the scrap iron and steel business. Mr. Runyon for a number of years was a member of the sales organization of the Whitaker-Glessner Co., Portsmouth, Ohio, and during the war was in the Ordnance Department. He had charge of the scrap depot at Neville Island, Pittsburgh, after the Armistice.

A. W. VAN BUREN, district manager of sales at Chicago for the Consolidated Machine Tool Corporation of America, has tendered his resignation to take effect Oct. 1.

JOHN J. EHRHARDT, Jersey City, N. J., has been appointed United States trade commissioner at Tientsin, China. Mr. Ehrhardt, a graduate of the Stevens Institute of Technology, Hoboken, N. J., is a mechanical engineer of wide experience.

Coming Meetings

September

Canadian National Exhibition. Sept. 4 to 7. Second steel and power show, University of Toronto Arena, Toronto, Canada. C. Bradshaw, 24 Front Street, West, Toronto, executive director.

Institute of Metals. Sept. 4 to 7. Fall meeting, Liverpool, England. G. Shaw Scott, 36 Victoria Street, London, S. W. 1, England, secretary.

Lake Superior Mining Institute. Sept. 7 and 8. Joint meeting with iron and steel division of the American Institute of Mining and Metallurgical Engineers, Crystal Inn, Crystal Falls, Mich., starting place. A. J. Yungbluth, Ishpeming, Mich., secretary.

American Manganese Producers' Association. Sept. 10 and 11. Annual meeting, Mayflower Hotel, Washington. J. Carson Adkerson, Metropolitan Bank Building, Washington, president.

American Society of Mechanical Engineers. Sept. 17 to 20. Second national fuels meeting, Hotel Cleveland, Cleveland. Calvin W. Rice, 29 West Thirty-ninth Street, New York, secretary.

American Electrochemical Society. Sept. 20 to 22. Fall meeting, Hotel Kanawha, Charleston, W. Va. Colin G. Fink, Columbia University, New York, secretary.

American Society of Mechanical Engineers. Sept. 24 to 27. Machine shop practice meeting, Cincinnati. L. C. Morrow, 29 West Thirty-ninth Street, New York, chairman of division.

October

American Society of Mechanical Engineers. Oct. 1 to 3. New England Industries meeting, Statler Hotel, Boston. Calvin W. Rice, 29 West Thirty-ninth Street, New York, secretary.

Concrete Reinforcing Steel Institute. Oct. 1 to 3. Fall meeting, Buckwood Inn, Shawnee-on-Delaware, Pa. M. A. Beeman, 2112 Tribune Tower, Chicago, secretary.

National Safety Council. Oct. 1 to 5. Seventeenth annual meeting, Metals Section at Waldorf-Astoria Hotel, New York. John P. Eib, 108 East Ohio Street, Chicago, secretary Metals Section.

American Society for Steel Treating. Oct. 8 to 12. National Metal Exposition, morning sessions at Benjamin Franklin Hotel; afternoon sessions and exhibition at Commercial Museum, Philadelphia. W. H. Eisenman, 7016 Euclid Avenue, Cleveland, secretary.

American Institute of Mining and Metallurgical Engineers, Institute of Metals. Oct. 9 to 11. Fall meeting, Benjamin Franklin Hotel, Philadelphia. H. Foster Bain, 29 West Thirty-ninth Street, New York, secretary.

American Welding Society. Oct. 8 to 12. Fall meeting, Bellevue-Stratford Hotel, Philadelphia. M. M. Kelly, 33 West Thirty-ninth Street, New York, secretary.

American Gear Manufacturers Association. Oct. 11 to 13. Semi-annual meeting, Statler Hotel, Buffalo. T. W. Owen, 3608 Euclid Avenue, Cleveland, secretary.

Society of Industrial Engineers. Oct. 17 to 19. Fifteenth national convention, Hotel Seneca, Rochester, N. Y. George C. Dent, 205 West Wacker Drive, Chicago, secretary.

American Iron and Steel Institute. Oct. 26. Fall meeting, Commodore Hotel, New York. E. A. S. Clarke, 75 West Street, New York, secretary.

Coke Output for Seven Months and By-Products for a Year

Total coke production for the first seven months of the present year was 30,123,618 tons, against 30,656,781 tons for the corresponding period of 1927, according to the Bureau of Mines. Of the 1928 production, 27,582,618 tons was by-product coke and 2,541,000 tons was beehive coke, while for the 1927 output, 25,770,781 tons was by-product coke and 4,886,000 tons was beehive coke.

By-products obtained from coke oven operations in 1927, according to a bureau statement, had a total sales value, exclusive of breeze production, of \$138,903,882. Production of gas amounted to 700,894,799,000 cu. ft., of which 408,389,357,000 cu. ft. was sold for \$70,092,168, or an average of 17.2c. per 1000 cu. ft. Steel or affiliated plants used 244,969,339,000 cu. ft.

Production of tar totaled 546,859,205 gal., of which 305,898,176 gal. was sold for \$16,095,478, at an average price of 5.3c. a gal. Ammonia sulphate production was 1,216,141,460 lb., which was exceeded by sales, amounting to 1,267,753,969 lb., valued at \$24,802,926, an average price of 2c. a lb. Crude light oil production was 164,488,233 gal., which made 161,072,729 gal. of derived products. Sales totaled 9,265,948 gal., valued at \$1,077,957, or an average price of 11.6c. a gal. Crude and refined benzol production was 22,007,760 gal., of which 21,193,807 gal. was sold for \$4,371,519, at an average price of 20.6c. a gal. Motor benzol production was 86,995,343 gal., of which 86,802,745 gal. were sold for \$14,629,999, at an average price of 16.9c. a gal. Crude and refined toluol production totaled 12,093,590 gal., of which 11,784,984 gal. was sold for \$3,999,820 at an average price of 33.9c. a gal.

World Manganese Output 3,318,773 Tons

Approximate world output of manganese ore, with a metallic content of 30 per cent or more, was 3,318,773 gross tons during 1926, according to the minerals division of the United States Department of Commerce. Of this total 93 per cent was produced by five countries which consume annually but a comparatively small portion of their own output; 40 per cent by Russia, 30 by India, 11 by the Gold Coast, 8 by Brazil and 4 by Egypt. At the same time 1.4 per cent of the world's total was produced in the United States, 1.33 in Spain and 1.26 in China. The remaining proportion was produced by 20 other countries.

Approximately 68 per cent of the total world output of manganese ore is consumed by seven industrial nations. The approximate percentage of total world production consumed by these countries is as follows: United States 22, France 17, United Kingdom 10, Belgium 8, Germany 6,

Japan 3 and Italy 2 per cent. Although the above percentages are based on 1926 statistics, the relative positions of producing and consuming nations have varied little in recent years.

Canada Made Less Steel and Pig Iron in July

TORONTO, ONT., Aug. 31.—Production of pig iron in Canada in July amounted to 95,422 gross tons, a decline of 2 per cent from the record for the year of 97,379 tons produced in June. In July of last year 50,997 tons of pig iron was produced. Compared with the figures for the previous month, the totals for July show that more foundry iron was made, but the gain was not sufficient to offset the decline in the production of basic and malleable grades.

For the seven months ended July 31, production of pig iron in Canada totaled 563,435 tons in 1928, an increase of 24 per cent over the 454,710 tons of 1927, which in turn was 4 per cent better than that reported for the first seven months of 1926.

Active blast furnaces in Canada July 31 had a daily capacity of 2775 tons, or 67 per cent of the total capacity of all blast furnaces in Canada.

Production of ferroalloys in July was 2855 tons, or 31 per cent under the 4157 tons reported for June. For the year to date production totaled 28,869 tons, against 33,244 tons for the first seven months of last year.

Production of steel ingots and direct steel castings in July, at 82,807 tons, was 29 per cent under the output of 116,530 tons for the previous month, but 50 per cent above the 55,250 tons reported for July, 1927. Decreased output of basis open-hearth steel ingots accounted for the decline; this grade dropped from 111,324 tons in June to 78,528 tons in July.

For the seven months ended with July, production of steel ingots and direct steel castings totaled 731,145 tons, against 542,560 tons produced during the corresponding period of 1927, and 496,031 tons made during the first seven months of 1926.

The Dominion Bureau of Statistics index number for the group "Iron and Steel and Its Products" (1913 = 100) declined slightly in July, being 139.4 as compared with 139.7 in June. Minor price declines occurred in steel bars and steel sheets.

The Dominion Bureau of Statistics has revised the list of Canada's installed blast furnace capacity. Figures formerly included a number of obsolete furnaces which were not likely to be put into blast again, and, therefore, could not be regarded as representing available capacity. The new figures show 11 stacks in Canada, which can be called upon to produce a total of 4125 gross tons a day. Four of these furnaces, with a capacity of 1400 tons, are owned by the Dominion Iron & Steel Co. (British Empire Steel Corporation), Sydney, N. S.; four, with

a capacity of 1800 tons, by the Algoma Steel Corporation, Sault Ste. Marie, Ont.; two, with a capacity of 800 tons, by the Steel Co. of Canada, Ltd., Hamilton, Ont.; and one, with a capacity of 300 tons, by the Canadian Furnace Co., Port Colborne, Ont. Furnaces not in blast at present time are capable of producing 1350 tons a day.

Malleable Castings Orders Gain in July

WASHINGTON, Aug. 31.—Production of malleable castings in July was 54,384 tons, or 59.9 per cent of capacity, against 60,779 tons, or 67 per cent of capacity in June, according to reports received by the Department of Commerce from producers.

Shipments in July amounted to 54,056 tons, compared with 58,992 tons in June, while July orders were 53,882 tons, against 51,388 tons in June.

For the seven months ended with July, production aggregated 410,686 tons, against 399,298 tons for the corresponding period of last year. The rate of operations for the seven months of the present year was 64.2 per cent, against 53.9 per cent for the first seven months of 1927.

Shipments were 393,124 tons, against 390,362 tons, while orders were 382,110 tons, compared with 360,398 tons.

Smaller Production of By-Product Coke in July

Production of by-product coke in July is placed by the United States Bureau of Mines at 3,911,082 net tons, a reduction of 1¼ per cent from the 3,961,268 tons of June. The figure is considerably higher, however, than the 3,657,706 tons of July, 1927. Beehive coke output totaled only 271,000 tons in July, compared with 302,000 tons in June and with 467,000 tons a year ago.

Total coke production in July was 4,182,082 tons, while total pig iron output was 3,071,824 gross tons. The ratio was 1.36 net tons of coke for each gross ton of pig iron, compared with 1.38 tons in June and with 1.40 tons in July, 1927.

Hours and Wages in Non-Ferrous Plants

Recent studies by the Bureau of Labor Statistics, Department of Labor, show the hours of labor and earnings of employees engaged in the manufacture of aluminum, brass and copper wares, and in mills making brass and copper sheets, rods, tubes, wire and shapes. In the first industry the average full-time hours a week of male and female employees combined were 52.3 and the average full-time weekly earnings were \$26.83; in the copper and brass mills the average full-time hours per week were 53.8 and the average full-time weekly earnings, \$29.70.

Improvement in European Markets

Better Tone in Great Britain and Advancing Prices on Continent—Production Continues High in Germany

(By Cablegram)

LONDON, ENGLAND, Sept. 3.

DEMAND for British steel is improving, particularly as Continental prices are stiffening. Export inquiry for pig iron is increasing, though actual sales as yet are small, while foreign pig iron is not competitive in the British domestic market. Hematite makers are increasing production by starting up one Newport Iron Works (Middlesbrough) furnace and one Carlton blast furnace on ferromanganese. Foreign ore is quoted on the basis of the termination of the Swedish strike; little important change is expected this year.

There is good demand for British semi-finished steel and prices are advancing. Export demand for finished iron and steel is generally quiet, but domestic consumers are more interested, especially in small-section materials. Heavy plate mills are badly in need of orders.

Clyde shipbuilding output in August was 22 vessels launched, aggregating 73,500 gross register tons.

Tin plate sales have been moderate in amount, but there are important inquiries still under negotiation and makers anticipate renewal of activity.

Galvanized sheets are active. Merchant buyers have placed substantial contracts and, considering India and other markets, a large export business is expected to develop before long. Black sheets are quiet.

On the Continent of Europe

Continental iron and steel prices are strong, particularly in the finished materials. Works are well sold up and a fair volume of overseas export business has been transacted direct. Many works are now off the market.

Belgian output in July was 324,000 tons of pig iron and 311,000 tons of raw steel (steel ingots and castings).

a further advance in export prices is considered probable. Domestic quotations of the Big Iron Syndicate for August are unchanged, and it is assumed that the Ingot Steel Syndicate will continue its present schedule of prices.

Reports that formal negotiations have been instituted among the members of the International Steel Cartel to develop means of meeting the threat of export competition from United States mills are evidently exaggerated. It is suggested that some change in the cartel is worthy of discussion, in view of the formation of the American steel export association, but apparently Western German producers are not yet much concerned over the possible danger to Continental export trade. It is proposed, however, that formation of selling syndicates for the various products controlled by the steel cartel again be discussed.

Domestic business in machinery shows a further decline, but export sales continue in fair volume. Both domestic and export sales of machine tools have increased, but business in agricultural machinery is unsatisfactory. Machinery exports in the first half of the year totaled 42,551 metric tons, compared with 44,340 tons in the first half of 1927. Russia is still Germany's best customer for machinery, but is buying less than formerly, and Italy has reduced purchases. This decline has been partly

German Production Still High

Better Exports Offset Decline in Home Trade—Machinery Imports Large, Especially From United States

BERLIN, GERMANY, Aug. 17.—Increased steel export business has made it possible for German mills to maintain a fair production schedule, despite the decline in domestic demand. Export prices are rising, and

it is reported from Belgium that works there have sufficient tonnage booked to keep them occupied until late in the fall. German export sales are at present at slightly higher prices than French and Belgian, and

British and Continental European prices per gross ton, except where otherwise stated, f.o.b. makers' works, with American equivalent figured at \$4.86 per £ as follows:

Durham coke, del'd.....	£0 17½s.		\$4.25

offset by increased business from Poland and the Baltic countries.

Imports of agricultural machinery are increasing, having totaled 6652 tons in the first half of this year compared with 3921 tons in the same period of 1927. Of the total received in the first half of this year the United States furnished 2796 tons.

As a result of the refusal of the Government to extend aid to the locomotive builders, several mergers and partial mergers are reported. Henschel & Co., at Cassel, have entered into an agreement with the Maschinenfabrik Buckau-Wolf, to take over

the latter's locomotive building shops. The Stettin Vulcan Co., it is reported, is about to abandon all locomotive construction. Even the present low level of locomotive exports is being maintained only by selling at exceedingly low prices. It is said that locomotives that bring 1700 m. (\$404.60) per ton in Germany are exported for 1000 m. (\$238) per ton.

Pipe and tube mills are inactive, but expect some future business following the development of present plans for long-distance gas lines. Orders for pipe to be used for this purpose already total 35,000 tons.

Japanese Steel Market Quiet

Curtailment of Trade With China and Decline In Value of Yen Are Factors—Wire Rod Output Increases

EXPORTS of sheets to China by Japanese sellers have almost ceased, says the monthly report of A. Cameron & Co., Kobe, Japan. In addition, local demand is light because of the usual summer depression. In August the Kawasaki Dockyard Co. reduced its prices on light-gage sheets 1 yen (45.2c.) per ton. Foreign black sheets, 13 to the bundle, are unchanged at 73.50 sen (33c.) per sheet for American material and 72.50 sen (32c.) per sheet for British sheets. Imports of sheets to Japan in June increased 1623 tons compared with the preceding month, when the total was 14,918 tons. The imports were distributed as follows: British, 9387 tons; American, 3500 tons; German, 1822 tons; Belgian, 189 tons, and Swedish, 20 tons. This brings the total arrivals of sheets in the first half of the year to 85,386 tons.

The tin plate market was inactive throughout July, because of the rains during the first two weeks, and local holidays in the latter half of the month. Weakness in the exchange value of the yen caused some slight advances in the quotations on foreign tin plate in this period. Stocks of British material in Japan are reported small. Latest quotations on tin plate are 12.50 yen (\$5.65) per 100-lb. base box for American, 12 yen (\$5.42) per base box for British, and 11.25 yen (\$5.09) per base box for Yawata (Government Steel Works).

Despite arrivals of small quantities of wire rods in an inactive market, no depression of prices is evident, and quotations are fairly steady. Weakness in the exchange value of the yen has resulted in some strengthening of prices, so that latest quotations are about 106 yen (\$47.90) per ton for foreign wire rods. The price of the Government Steel Works for October delivery is 94 yen (\$42.49) per ton, a decline of 1 yen (45.2c.) per ton from the previous level. There is still much business in wire rods in prospect, as the Government Steel Works is not yet equipped to furnish all the requirements of Japanese consumers. The following comparison of domestic production and imports of

wire rods, in metric tons, shows a steady increase in Japanese output and large imports:

	Government Steel Works	All Other Domestic	Imports
1922....	14,691	12,903	54,078
1923....	21,446	18,178	54,327
1924....	21,797	9,898	88,242
1925....	35,668	12,968	51,319
1926....	43,800	6,204	117,971
1927....	49,018	16,719	109,090

Exports of wire nails to China have almost ceased, so that, although local production is limited, the local market has become slightly overstocked. Prices sagged early in July, but later some strength developed as small orders began to come in from the country districts and the wire rod market became firmer. Latest quotations are 8.55 yen (\$3.86) per keg. Galvanized wire prices followed the trend in the wire nail market and showed slight weakness, later recovering when a steadier tone developed in the wire rod market.

Foreign Steel Prices High— New Marking Decision Awaited

NEW YORK, Sept. 3.—Importers are receiving higher quotations from Continental steel mills on bars, shapes, hoops and bands than a week ago, and, except for occasional lots of material placed at slightly lower prices with mills seeking certain sizes to complete rollings, the market is too high to permit much business. The most recent prices quoted on ordinary Thomas steel bars are 1.85c. per lb., duty paid, New York, and on shapes, 1.72c. to 1.77c. per lb., duty paid.

The United States Treasury Department is continuing its investigation of the question of marking imported steel with the country of origin, and some importers suggest that its decision may be made retroactive. This, however, is doubted by many, as the previous decision of the department clearly stated that billets, blooms, plates, shapes and bars were "material," and as such were not subject to marking. A recent decision on marking imported cigars, however, is

suggested as the possible basis for retroactive measures.

Export business is quiet, but, although mills are apparently in a better position on tonnage to be rolled, no upward revision of export quotations is reported. About 20,000 boxes of canner's tin plate for the provision department of the Japanese Army are understood to have been placed with one of the three important Japanese export houses in New York. About 275 tons of channels for car frames, bought by the Imperial Government Railways in Japan, went to a New York exporter for execution by an American mill, and 542 tons of mild steel plates for car building was also placed with an American mill by the South Manchuria Railway Co.

United States Large Buyer of German Wire Netting

HAMBURG, GERMANY, Aug. 18.—The United States has become Germany's second largest customer for wire netting, having taken 1971 tons in the first half of this year, compared with 1356 tons in the first half of 1927 and 907 tons in the first half of 1926. The total exports of wire netting in the first half were 10,784 tons, compared with 9573 tons in same period of 1927. The largest market for wire netting was South Africa, which took 3420 tons in the first half, and South America was a large buyer, Argentina having taken 731 tons, compared with 495 tons in the same period of last year.

Krupp Erecting Two New Furnaces on Rhine Canal

HAMBURG, GERMANY, Aug. 18.—Two blast furnaces, with a combined capacity of about 850 tons a day, are being erected on the Rhine-Herne Kanal by the Friedrich Krupp A. G. These will replace three old furnaces, which are to be dismantled. The first of the new furnaces will be blown in about Oct. 1. Open-hearth steel mills at the same site are being modernized.

American Company Licensed for German Sheet Process

HAMBURG, GERMANY, Aug. 18.—According to current reports, a license to manufacture aluminum plates and sheets under the "Feran" process has been sold by the German inventors to an unnamed American company for about \$1,000,000. Negotiations with British, French and Italian companies interested in securing licenses for this process are continuing.

The Interstate Commerce Commission has granted an extension from Sept. 15 to Nov. 1 for filing briefs and from Oct. 1 to Dec. 1 for filing reply briefs on the application of the mileage scale recommended by the examiners in Docket 17,000, Part 6.

Machinery Markets and News of the Works

August Tool Sales Large

Month's Business Was Surprisingly Good and for Some Sellers Exceeded That of July

MACHINE tool business in August was surprisingly good, and for some sellers was in excess of that done in July. The total sales for June, July and August have undoubtedly been considerably ahead of those for any summer in recent years.

In addition to the business closed, inquiries were numerous and a sufficiently large volume is pending to give force to expectations that the present buying rate will be equaled if not surpassed in September.

Cincinnati machine tool builders report that their August sales were 10 to 15 per cent greater than those of July, this high level having been brought about by liberal purchases by three or four automobile companies in the Detroit district. Some of the Cincinnati machine tool plants are now operating at the highest rate since 1919.

The first eight months of 1928 have shown a substantial gain over the same months in 1927. One Cincinnati builder reports an increase of 35 per cent, but 20 to 25 per cent is probably nearer the average. A number of companies state that business has come from a greater diversification of sources than in many years.

An order from a Detroit automobile manufacturer for special machines, totaling about \$100,000 in value, was probably the largest transaction of the week. In the East, inquiries have been numerous and include one for about \$100,000 worth of tools. Several sizable lists are pending in the Chicago market.

New York

NEW YORK, Sept. 4.—The past week has brought a greater number of inquiries for machine tools than orders, indicating to the trade that business in September will equal and perhaps exceed that of August, which for some sellers was the second best month of the year. The Niles-Bement-Pond Co. reports that its August sales exceeded those of any other month of the year, the business of the Pratt & Whitney division being particularly good. Included in the inquiries of the week is one which calls for about \$100,000 worth of new equipment. In addition, the call for single tools was larger than in any recent week. Some machine tool builders are handicapped in quoting because of inability to make early deliveries.

Niles-Bement-Pond Co. reports sales of a combination journal turning and axle lathe, a 60-in. x 41-ft. lathe and other smaller machines, while the Pratt & Whitney division sold eight lathes, three vertical surface grinders, two jig borers, 12 ball-bearing testing machines, three automatic lathes, a vertical shaper, two universal bench milling machines and a production hand milling machine.

Bart and John P. Walther, 103 East 125th Street, New York, architects, have

plans under way for a one-story plant at 539-53 East 118th Street, to be equipped as a wire annealing works, for a company whose name is temporarily withheld, estimated to cost about \$40,000.

Radio Corporation of America, Woolworth Building, New York, has approved plans for extensions and improvements in its transmitting plant at Riverhead, L. I., to cost about \$200,000, with power and other equipment.

Fairchild Aviation Corporation, 270 West Thirty-eighth Street, New York, has begun work on a new airport at Lac a la Tortue, Que., consisting of airdrome, repair and reconditioning shops, oil storage and distributing buildings and other mechanical units, reported to cost more than \$100,000.

Union Railway Co. of New York, 2396 Third Avenue, has filed plans for one-story equipment storage and distributing plant, 50 x 115 ft., at West Farms Road and 172nd Street, to cost close to \$30,000. E. H. Faile & Co., 441 Lexington Avenue, New York, are architects.

General Cable Corporation, 420 Lexington Avenue, New York, has acquired Detroit Insulated Wire Co., 4647 Wesson Avenue, Detroit, and will consolidate as a unit in its organization, operating in future as Detroit Insulated Wire Division of parent company.

R. Hoe & Co., 504 Grand Street, New York, manufacturers of printing presses,

saws, etc., are arranging for a note issue of \$800,000, and stock issue of 16,000 shares, the majority of proceeds to be used for proposed purchase of factory of De La Vergne Machine Co., on East River, from 137th to 138th Street, and consolidation of manufacturing operations at that location, including removal of present Grand Street and Dunellen, N. J., works there, and additional facilities for increased output. H. R. Swartz is president.

New York Central Railroad Co., Grand Central Terminal, New York, has authorized plans for extensions and improvements in its yards, shops and commissary buildings at the Mott Haven yards, including erection of new five-story building, aggregating about 85,000 sq. ft. floor space, entire project to cost in excess of \$2,000,000, with equipment.

Andrews Lead Co., 36 Greenpoint Avenue, Long Island City, has awarded general contract to M. J. Irwin & Son, 48-70 Thirty-seventh Street, for a one-story addition to cost close to \$45,000, with equipment. G. B. Webb, 10 East Forty-third Street, New York, is architect.

Conveying machinery, refrigerating apparatus, power equipment, and other mechanical equipment will be installed in new three-story plant to be erected by Armour & Co., Chicago, on Seventh Street, near Monmouth Street, Jersey City, N. J., 120 x 130 ft., reported to cost more than \$700,000, with machinery.

Western Electric Co., 195 Broadway, New York, manufacturer of wire and cables, radio equipment, etc., has awarded general contract to Austin Co., 120 Broadway, for new seven-story unit at plant at Kearny, N. J., to cost more than \$1,000,000, with equipment.

Public Service Electric & Gas Co., Public Service Terminal, Newark, has acquired property on Blazing Star Road, Port Reading, near Perth Amboy, N. J., and is reported planning construction of new large steam-operated electric generating plant at that place.

Arcturis Radio Co., 247-55 Sherman Avenue, Newark, manufacturer of radio devices and equipment, tubes, etc., has leased two-story factory at 141-43 Frelinghuysen Avenue, and portion of building at 218-26 Elizabeth Avenue, and will use for expansion. It is understood that portion of present plant will be removed to first noted location and capacity increased.

Paige & Jones Chemical Co., New York and Hammond, Ind., has purchased patent rights and good will pertaining to lime soda water softening business of American Water Softener Co., Philadelphia, and will manufacture and sell this equipment in future. W. T. Runcie and H. C. Waugh, formerly sales manager and engineer respectively of American company, have been added to Paige & Jones organization.

Grant Home Heater Corporation has removed its New York offices to factory and demonstrating rooms at 123 Montgomery Street, Jersey City.

Air Reduction Co., Inc., 342 Madison

The Crane Market

MORE inquiries for overhead and locomotive cranes have appeared in the market during the past week and there has been some buying of both locomotive and overhead cranes. A 10-ton hand power crane for Lehigh University and a 10-ton, 40-ft. span, 3-motor crane for the University of Illinois, are still pending. The De La Vergne Machine Co., which recently disposed of its New York plant to R. Hoe & Co., New York, and moved to the plant of the I. P. Morris Machine Works, Philadelphia, is reported to have placed an order with a Philadelphia crane builder for six electric traveling cranes. Inquiry for locomotive cranes is increasing and several purchases are reported to have been made in

this district during the past week. A sand and gravel company, subsidiary of the Eastern New Jersey Power Co., South River, N. J., is reported to have closed on a 10-ton crawl-tread locomotive crane and the Standard Oil Co. of New York on two crawl-tread locomotive cranes for export. The Borough of Richmond, New York, has been taking bids on a 10-ton crawl-tread locomotive crane.

Among recent purchases are:

Stevens & Wood, Inc., 120 Broadway, New York, reported to have closed on 100-ton, 72-ft. 6-in. span overhead crane, with Niles Crane Corporation.

N. P. Nelson Mfg. Co., Allwood, N. J., 5-ton, 27-ft. span, hand power crane from Box Crane & Hoist Corporation.

Asiatic Petroleum Corporation, 65 Broadway, New York, three 7½-ton crawl-tread locomotive cranes and one 7½-ton stationary crane for mounting on a barge, from Industrial-Brownhoist Corporation.

Rosenthal Engineering Contracting Co., 12 East Forty-first Street, New York, 5-ton truck crane, the second in a fortnight, from Browning Crane Co.

Cullen Friestedt Co., Chicago, 15-ton, 60-ft. span, 3-motor, overhead crane from builder in Middle West.

Bendix Corporation, South Bend, Ind., overhead electric crane of unstated capacity from Cleveland Crane & Engineering Co.

Avenue, New York, has purchased business and property of Ohio Oxygen Co., Niles, Ohio. Former company now controls 37 oxygen plants located in principal industrial centers.

Pittsburgh

PITTSBURGH, Sept. 3.—Machine tool business maintains its recent improvement. In addition to a steady sprinkling of orders, inquiry continues to expand. The Carnegie Steel Co. is in the market for a lathe, a bending machine and a saw for one of its Pittsburgh district plants. The Westinghouse Electric & Mfg. Co. still has a few machines to award on its third quarter list.

Officials of Mackintosh-Hemphill Co., Pittsburgh, manufacturer of rolling mill machinery, with plant at Twelfth and Etna Streets, have organized a new company of same name under Delaware laws, with capital of 100,000 shares of stock, no par value, to take over and expand present company.

Swan-Finch Refining Co., recently formed as subsidiary of Swan-Finch Oil Co., 522 Fifth Avenue, New York, an interest of Standard Oil Co. of New York, 26 Broadway, has concluded arrangements for purchase of Seneca Oil Works, Inc., Franklin, Pa., with local refinery. New owner plans early expansion in existing plant to develop output of 10,000 bbl. per day, including large division for gasoline production. Purchasing company is capitalized at \$500,000.

Board of Education, Erie, Pa., plans installation of manual training equipment in new two-story senior high school on West Sixth Street, estimated to cost \$1,000,000, for which bids have been asked on general contract. Meyers & Johnson, Commercial Building, are architects.

Ralph F. Dawson, care of J. D. S. Truxall, 144 Union Trust Building, Pittsburgh, and associates are organizing Dawson Aircraft Corporation, to establish and operate local plant for manufacture of airplanes and parts, for which site has been selected and work will soon begin.

In connection with new warehouse and distributing plant on Eleventh Street, Pittsburgh, Carnegie Steel Co., Carnegie Building, plans installation of five 10-ton double-trolley overhead electric traveling cranes and other material conveying and handling equipment. A machine shop will be installed, including electric-oper-

ated friction saws, punches, drill presses; bar, plate and angle shears; riveting machines and other tools. Unit is scheduled for completion by end of year.

Joseph F. Doven, 241 Catalpa Place, Mount Lebanon, Pittsburgh, and associates have organized American Tile Fixture Co., and plans operation of local plant for manufacture of soda fountains and fixtures, lunch counters, etc. Charles J. Brody, 1007 Flemington Avenue, Pittsburgh, is interested in new company.

Philadelphia

PHILADELPHIA, Sept. 3.—Contract has been let by A. H. Fox Gun Co., Eighteenth Street and Wagner Avenue, Philadelphia, to Van Asdlen Construction Co., Stock Exchange Building, for a new one story addition to cost close to \$20,000 with equipment.

Cramp-Morris Industrials, Inc., Richmond and Norris Streets, Philadelphia, has awarded general contract for one-story unit to Fred A. Havens, Inc., 845 North Nineteenth Street, to be equipped as a machine shop. It will be used in connection with removal of De La Vergne Machine Co. division, manufacturer of ice-making and refrigerating machinery, from New York to Philadelphia works.

Marshall Brothers & Co., Front Street and Girard Avenue, Philadelphia, sheet metal products, tinner's supplies, roofing, etc., has leased a portion of the former pottery of John Maddock Co., Muirhead Avenue, Trenton, N. J., and will improve and equip for a new factory branch and distributing plant. S. F. and F. W. Marshall are heads.

Iroquois Electric Refrigeration Co., a subsidiary of General Asphalt Co., Insurance Company of North America Building, Philadelphia, manufacturer of electric refrigerating equipment, is planning to discontinue operations and will dispose of its property and assets by the end of the year.

Cadillac Motor Car Co., Broad Street and Ridge Avenue, Philadelphia, has asked bids on general contract for a new service, repair and sales building at 164 West Chelton Avenue, reported to cost in excess of \$100,000 with equipment. Philip S. Tyre, 114 South Fifteenth Street, is architect.

Pennsylvania Railroad Co., Broad Street Station, Philadelphia, has approved plans for new coal pier on Terminal Avenue, near Delaware Avenue, with ele-

vating, conveying and other mechanical handling equipment, estimated to cost \$325,000.

Atlantic Radiator Shield Co., Philadelphia, has leased building at 4317 Walnut Street, and will remodel and occupy for new plant.

Officials of Girard Smelting & Refining Co., Tioga and Richmond Streets, Philadelphia, have organized a new company of same name, to take over and expand present plant and business. Joseph Axelrod and Louis Schwab, 5231 Gaynor Road, head new organization; last noted will be treasurer.

Williamsport Airport Co., Williamsport, Pa., has been formed with capital of \$100,000, to establish and operate local airport, including hangars, repair and reconditioning shops, oil storage and distributing buildings, and other mechanical units. Company is headed by A. W. Siegel and S. T. McCormick, Jr., Williamsport; and J. A. Heim, Montoursville, Pa.

Lehigh Valley Railroad Co., 143 Liberty Street, New York, will carry out an expansion and improvement program at yard at Pittston, Pa., to cost about \$200,000, including installation of automatic car retarders, new mechanical dumping equipment and other equipment.

Harvey S. Billheimer, 810 North Sherman Street, Allentown, Pa., and associates have organized a new company to be known as Bethlehem Mfg. Co., to establish and operate a plant at Fountain Hill (Lehigh County) for manufacture of tools, castings and kindred mechanical equipment. William A. Buss, 1218 Broadway, Fountain Hill, is also interested in new organization.

United States Air Transport, Inc., Camden, N. J., recently formed under Delaware laws to take over Camden airport, Gettysburg, Pa., flying field, and other properties, is planning an expansion and improvement program, including establishment of airports at Harrisburg, Pa., New Market, Va., Baltimore and Luray Caverns, Va., in connection with trimotored airplane service, with hangars, repair and reconditioning shops, oil storage and distributing buildings, and other structures. Company is disposing of stock issue to total \$625,000, proceeds to be used for developments noted. Robert E. Funkhouser is president.

American Bridge Co., Ridge and Wisahickon Avenues, Philadelphia, has approved plans for installation of crane runway at its local Pencoyd works, estimated to cost about \$50,000.

South Atlantic

BALTIMORE, Sept. 3.—Plans are being drawn by Hutzler Brothers Co., 212 North Howard Street, Baltimore, for six-story automobile service, repair and garage building to cost close to \$500,000, with equipment. Parker & Shaffer, 280 Madison Avenue, New York, are architects.

Board of Education, Easton, Md., is said to be considering installation of manual training equipment in new three-story high school, estimated to cost \$130,000, for which plans are being drawn by H. Powell Hopkins and Allan C. Burton, 374 North Charles Street, Baltimore, architects.

General Purchasing Officer, Panama Canal, Washington, will receive bids until Sept. 11 for one portable grinder, 60 metal-cutting band saws, 12 sets of dies, one air compressor and other mechanical equipment; until Sept. 20 for wire cloth, wire lath, pumps, cable clips, pressure gages, etc., schedules 2466 and 1900, respectively.

Carolina Tractor & Equipment Co., Salisbury, N. C., is planning purchase of two or more Diesel type locomotives, 20 to 25 tons capacity, 36-in. gage.

Asiatic Petroleum Co., Ltd., 65 Broadway, New York, is perfecting plans for construction of new storage and distributing plant on Patapsco River, Fairfield, Baltimore, where tract of land recently was acquired, including pumping plant, boiler house and other mechanical units, reported to cost close to \$500,000 with equipment. Initial plant will be extended at later date.

Bureau of Yards and Docks, Navy Department, Washington, is asking bids until Oct. 3 for one electric bridge crane at naval air station, San Diego, Cal., specification 5713.

Board of Aldermen, Columbia, N. C., is asking bids until Sept. 10, for municipal electric power plant, including fabricated steel building complete, mechanical and electrical equipment and high tension distributing system. W. H. McClees is city clerk.

Newman Machine Co., Jackson Street, Greensboro, N. C., is said to be planning early installation of additional equipment, including turret lathe, metal-cutting saw and other tools.

Farmville Furniture & Cabinet Co., Farmville, Va., has work under way on new plant to cost approximately \$70,000 with equipment.

Buffalo

BUFFALO, Sept. 3.—Contract has been let by Genesee Motoramp Garage, Inc., Buffalo, to Metzger Construction Corporation, 676 Genesee Street, for six-story service, repair and garage building on Pearl Street, near Genesee Street, to cost about \$600,000, of which more than \$200,000 will be expended for equipment. Completion is scheduled by close of year.

Ward & Dickinson, Inc., Silver Creek, N. Y., manufacturer of dining cars and accessories, is disposing of a preferred stock issue of \$560,000, a portion of fund to be used for expansion in output. Lee F. Dickinson is president.

Charles O. Maxwell, 430 University Block, Syracuse, N. Y., and associates have organized Canastota Sherwood Stamping Corporation, with capital of 1000 shares of stock, no par value, and plans operation of plant at Canastota, N. Y., for manufacture of stamped metal goods, in-

cluding toys and other novelties. Howard H. Francis is also interested in company.

J. A. Reynolds, 8416 West Riverside Drive, Niagara Falls, N. Y., is at head of project to construct and operate automobile service, repair and garage building on Prospect Street, near Niagara Street, to cost about \$100,000 with equipment. W. W. LaChance, Trust Company Building, architect, has been engaged to prepare plans.

Liberty Playthings, Inc., Niagara Falls, N. Y., has concluded arrangements for purchase of Liberty Toy Mfg. Co., East Aurora, N. Y., and will merge with organization. Expansion program is planned at Niagara Falls plant for toy manufacture.

Chicago

CHICAGO, Sept. 3.—Leading machine tool dealers in Chicago variously report that August from the viewpoint of sales was even better than July or the best month of the year. In any event there is little room for doubt that purchases in the three summer months were the largest enjoyed by local dealers in many years. Reports are to the effect that the Studebaker Corporation will move its Detroit plant to South Bend, Ind., and that when this move is made additional machine tool equipment will be needed. The Allis-Chalmers Mfg. Corporation, Milwaukee, has postponed action until Sept. 15 on a list which will total \$100,000. A list of similar size for the A. O. Smith Corporation, Milwaukee, is still before the trade. A sizable list is expected soon from the International Harvester Co. A Western drill manufacturer has sold 34 drilling machines for use in an automobile plant at Detroit. A jig boring machine will be purchased for the Rock Island Arsenal. Inquiry is active and the outlook for September is favorable.

Water Works Department, Cedar Rapids, Iowa, H. F. Bloomquist, superintendent, will install pumping machinery and power equipment to cost \$500,000. H. R. Green Co., Beaver Building, Cedar Rapids, Iowa, is consulting engineer.

Progressive Brass Co., formerly located in Kansas City, Mo., will move its plant to 1702 East Sixth Street, Tulsa, Okla.

Globe Steel Tube Co., 1345 Burnham Street, Milwaukee, will build a plant addition, 110 x 240 ft. to cost \$50,000.

Northeastern Iowa Power Co. is planning extensions and betterments to its plant at Independence, Iowa.

Construction Machinery Co., Waterloo, Iowa, has acquired the plant and business of the Marsh-Capron Co., Chicago Heights, Ill., makers of concrete mixers. For the time being operations will be continued at both the Waterloo and Chicago Heights plants, but it is the intention of the new owner gradually to work the products of the East Chicago plant into the factory at Waterloo.

Board of Trustees, University of Chicago, 189 West Madison Street, Chicago, has plans nearing completion for new two-story power plant. P. B. Maher, 157 South Dearborn Street, is architect.

Rockford Stamping & Tool Co., Rockford, Ill., care of W. W. Aditz, 625 North Independence Avenue, recently organized with capital of \$30,000, by Mr. Aditz and associates, is arranging for lease of local property for establishment of new plant

to manufacture stamped metal goods, engineering parts and tools.

International Harvester Co., 606 North Michigan Avenue, Chicago, is planning an addition to plant on Forty-third Avenue, Rock Island, Ill., reported to cost in excess of \$100,000, with equipment.

O. D. Jennings & Co., 4329 Lake Street, Chicago, manufacturer of coin vending machines and parts, is planning construction of new addition to cost in excess of \$100,000, with equipment.

Board of City Commissioners, Yankton, S. D., will receive bids until Sept. 11 for two low head deep well turbine type pumping units, and for three high head centrifugal pumps, with auxiliary equipment, for municipal waterworks. Burns & McDonnell Engineering Co., Interstate Building, Kansas City, Mo., is engineer.

Union Carbide & Carbon Co., 30 East Forty-second Street, New York, manufacturer of industrial oxygen, welding apparatus, etc., has awarded general contract to G. H. Lounsberry, 322 East Superior Street, Duluth, Minn., for new one-story plant on Thirty-ninth Avenue, West, Duluth, reported to cost in excess of \$50,000, with equipment.

Aetna Auto Parts Co., 2107 South State Street, Chicago, has filed plans for a one-story repair shop addition at 2115 South State Street. H. E. Gallup, 646 North Michigan Avenue, is architect.

Board of Education, 650 South Clark Street, Chicago, E. E. Withall, business manager, is said to be planning installation of manual training equipment in new four-story junior high school at Berteau Avenue and North Major Street, reported to cost in excess of \$1,000,000. J. C. Christenson is school architect.

Streator Cold Storage Door Co., 903 La Rue Street, Streator, Ill., is considering erection of new one-story, addition to cost close to \$40,000, with machinery. W. M. Harsch is president.

Reynolds Engineering Co., Rock Island, Ill., manufacturer of special machinery, tools, jigs, dies, etc., has asked bids on general contract for a one and two-story L-shaped addition, to cost close to \$45,000, with equipment.

Cleveland

CLEVELAND, Sept. 3.—Machine tool business is holding up fairly well, although sales in August were slightly below those in July. In this territory business is coming almost wholly from manufacturers of automobile parts and there are few orders for more than single machines. No lists of any size are pending. Locally, there is a considerable amount of used machinery on the market at present and many prospective purchasers of new equipment wish to trade in old machines for new.

Bids will be asked by Board of Education, Sixth and Rockwell Streets, Cleveland, at early date for addition to foundry at school on Eagle Avenue, estimated to cost about \$45,000, with equipment. G. M. Hopkinson is school architect.

DeVilbiss Co., Toledo, Ohio, manufacturer of spraying equipment and devices, has plans under way for new addition, reported to cost about \$65,000, with equipment.

Willys-Overland Co., Central Avenue, Toledo, Ohio, has awarded general contract to A. Bentley & Sons Co., 201 Belmont Avenue, for new addition to auto-

mobile plant to cost close to \$100,000, with machinery.

Leubee Brothers, Inc., Zanesville, Ohio, recently formed by Joseph and Lee Leubee, to manufacture machinery and parts, has engaged John P. Schooley, Zanesville, architect, to prepare plans for a one-story foundry and machine shop, 100 x 280 ft., reported to cost in excess of \$45,000, with equipment.

Willard Storage Battery Co., 246 East 131st Street, Cleveland, has awarded general contract to S. W. Emerson Co., 1836 Euclid Avenue, for one-story addition, 65 x 215 ft., to cost approximately \$80,000, with equipment. R. C. Norberg is president and general manager.

Goodrich Rubber Co., South Main Street, Akron, Ohio, manufacturer of automobile tires, mechanical rubber goods, etc., has asked bids on general contract for two new additions, reported to cost in excess of \$125,000. One of units will be used for manufacturing and other for storage and distributing service.

Ferro Enameling Co., Keith Building, Cleveland, has awarded contract for two-story plant addition, 54 x 66 ft., to P. Kirschner Co., 2725 Pittsburgh Avenue, Cleveland.

Detroit

DETROIT, Sept. 3.—Buhl Aircraft Co., Marysville, Mich., is working on the largest single order it has ever received, 11 airplanes costing \$12,000 each, to be used by the Canadian National Transport Co., Ltd., Toronto, on its air passenger lines in Canada. Canadian National Transport Co. is also the Toronto distributor for the Buhl Aircraft Co.

A steel roofed, brick addition to plant of Monroe Steel Castings Co., Monroe, Mich., had to be built to accommodate a Tate-Jones automatically controlled, low-pressure, oil-fired annealing furnace, car type. The car of the furnace is 6 x 15 ft. and has a loading capacity of 15 tons.

Plans are being drawn by Oldberg Mfg. Co., 2661 East Grand Boulevard, Detroit, manufacturer of automobile mufflers, etc., for a one-story top addition to cost close to \$30,000. C. W. Brandt, 2111 Woodward Avenue, is architect.

American Chain Co., Adrian, Mich., is planning for increase in capacity in local plant, used for production of automobile bumpers, and will provide additional facilities for this purpose. J. M. Reifsnider is factory manager. Headquarters are at Bridgeport, Conn.

Bay City Electric Casting Co., Bay City, Mich., is considering early rebuilding of portion of plant destroyed by fire, Aug. 19, with loss reported at close to \$100,000 with machinery.

Chrysler Motor Car Co., Massachusetts Avenue, Detroit, has awarded general contract to R. H. Hidey, General Motors Building, for a one-story addition, 80 x 536 ft., on Oakland Avenue, reported to cost in excess of \$150,000 with equipment.

Olds Motor Works, Lansing, Mich., division of General Motors Corporation, Detroit, has awarded general contract to Reniger Construction Co., Lansing, for four new additions, comprising two-story tool works, 130 x 480 ft.; one-story addition to sheet metal plant, 100 x 185 ft.; two-story extension to enameling works, 25 x 200 ft., designed to increase output in this division by 70 per cent; and one-story heat treating plant, 70 x 145 ft. Work will be carried out in connection with expansion program to cost close to \$1,000,000. Irving J. Reuter is president and general manager.

Knight Screw Products Co., 6510 Epworth Boulevard, Detroit, is said to be planning a one-story machine shop addition to cost in excess of \$25,000 with equipment.

Shwayder Trunk Mfg. Co., Denver, Colo., manufacturer of metal trunks, etc., has leased former plant of Hinckley Motors, Inc., Ecorse, Mich., and will improve and equip for branch plant.

Decker Screw Products Co., Mulberry and Huron Streets, Albion, Mich., has engaged P. T. Sharp, 111 West Ash Street, architect, to prepare plans for a new one-story addition, reported to cost close to \$30,000 with equipment.

Steel & Tubes, Inc., 224 East 131st Street, Cleveland, is taking bids on general contract for new one-story plant, 210 x 500 ft., at Ferndale, Detroit, reported to cost more than \$250,000 with machinery. Sessions Engineering Co., 228 North La Salle Street, Chicago, is engineer.

Board of Education, Pontiac, Mich., has approved plans for extensions and improvements at central high school, including new industrial building for manual training service and power plant, entire program to cost \$416,000.

St. Louis

ST. LOUIS, Sept. 3.—Bar-Rusto Corporation, 1808 Locust Street, St. Louis, operating a metal plating works, is planning expansion and improvement program, with installation of equipment to more than triple present capacity. Company has arranged for increase in capital from \$30,000 to \$130,000, majority of proceeds to be used for work. R. M. McCandish is president.

Ferro Concrete Construction Co., Third and Elm Streets, Cincinnati, has plans nearing completion for new multi-story automobile service, repair and garage building at Ninth and Chestnut Streets, St. Louis, to cost approximately \$400,000, with equipment.

Star Aircraft Co., Phillips Flying Field, Bartlesville, Okla., is said to be planning new one-story airplane manufacturing plant, with initial operations primarily for parts and assembling of planes, with motors to be purchased from outside interests, reported to cost close to \$40,000, with equipment.

Heck Electric Lawn Mower Co., Inc., 618 Pioneer Trust Building, Kansas City, Mo., has been organized to manufacture electric lawn mowers. Company will use considerable sheet steel and various electrical parts which will be purchased directly from manufacturers. Production is expected to begin within 30 days and some manufacturing equipment will be purchased. H. L. Heck is president and general manager.

A. Leschen & Sons Rope Co., 5909 Kennerly Avenue, St. Louis, manufacturer of wire rope, has filed plans for a two-story power house addition, reported to cost about \$35,000. Trueblood & Graf, Chemical Building, are architects.

New England

BOSTON, Sept. 3.—General feeling is that September will bring marked improvement in business. In the new tool market quite a large number of prospects give indications of being closed soon. Numerous inquiries for used tools, involving large shears down to small tool room lathes, are pending, many

of them running well into four figures. It is certain most of these prospects will materialize with the ending of the vacation season. New England shops generally are well employed. There is no surplus of skilled mechanics in Springfield, Worcester, Boston, Hartford, New Britain, and Providence. Worcester shops are advertising in Boston for such help. Small tools continue to sell well. August sales ran ahead of those for the same month last year. There remains a good demand for machine parts. Some of the used tool trade report difficulty in securing certain parts, and attribute this condition to the activity of tool builders.

Ralph E. Strand, Strand & Sweet Mfg. Co., Winsted, Conn., plans to organize a wire manufacturing company.

Work has started on a one-story, 100 x 360-ft. manufacturing plant addition for the Raybestos Co., Stamford, Conn.

Bridgeport Hardware Co., Bridgeport, Conn., is to build a one-story, 44 x 102-ft. manufacturing plant addition.

On Aug. 29 ground was broken for a 60 x 400-ft. blade manufacturing plant for the Ames Shovel & Tool Co., North Easton, Mass.

Fred T. Ley & Co., Boston and Springfield, Mass., have been awarded contract to make extensive plant improvements for Franklin County Power Co., Franklin, Mass. Charles T. Main, Inc., 201 Devonshire Street, Boston, is the engineer.

Work has been started on a one-story, 50 x 120-ft. brass foundry addition for M. S. Little Mfg. Co., Hartford, Conn. W. W. Dolliver, Hartford, Conn., is the architect. Conveying and miscellaneous equipment will be required.

Bids closed on Aug. 29 on an engine testing laboratory for Massachusetts Institute of Technology, Cambridge, Mass. Coolidge & Carlson, 89 State Street, Boston, are the architects.

Work has started on a four-story, 58 x 154-ft. chemistry building, State of New Hampshire, Durham, N. H., for which miscellaneous metalworking and testing equipment is required. E. T. Huddleston, Durham, is the architect.

Plans have been filed by Prairie Window Ventilator Co., 141 Georgia Avenue, Providence, R. I., manufacturer of metal window adjustments, etc., for a one-story addition, reported to cost in excess of \$25,000, with equipment. General contract has been let by C. I. Bigney Corporation, Providence. Company succeeded to plant and facilities of Metal Craftsmen, Inc., a number of months ago.

R. E. Goodman Co., Lynn, Mass., manufacturer of portable and fold-up tables and other furniture specialties, has leased Wason Building, Tanner and Lincoln Streets, Lowell, Mass., totaling about 30,000 sq. ft. floor space, and will equip for new factory. R. E. Goodman and Edward F. Wolff are heads.

New Departure Mfg. Co., Bristol, Conn., has acquired land and buildings on James Street and will use for future expansion of ball-bearing manufacturing plant.

Grafton Light & Power Co., Grafton, Vt., an interest of New England Power Association, Worcester, Mass., has secured permission to proceed with two hydroelectric power developments on Connecticut River at Fifteen Mile Falls, near Littleton, N. H., with power dams about 160 ft. high, to develop a capacity of close to 200,000 hp., reported to cost more than \$15,000,000, with transmission lines.

Hemphill Co., City Street, Central Falls, R. I., manufacturer of textile mill ma-

chinery, has work under way on a one-story addition to be used as a forge shop, reported to cost about \$20,000.

City Council, Pittsfield, Mass., has arranged fund of \$40,000 for new municipal airport, with hangar, repair and reconditioning shops, oil storage and distributing buildings and other mechanical units.

Board of Public Works, Park Department, Boston, is planning construction of municipal airport on 240-acre tract of land at Jeffries Point, to include hangars, machine repair and reconditioning shops, oil storage and distributing buildings, and other structures, with 8-ft. chain-link steel fence to enclose entire field. Initial investment will approximate \$125,000, and ultimate expenditure about three times that sum. Arthur A. Shurtleff is architect for department.

Indiana

INDIANAPOLIS, Sept. 3.—Negotiations have been concluded by Berghoff Properties, Inc., Fort Wayne, Ind., for purchase of Wayne Home Equipment Co., with local plant for manufacture of oil burners for domestic service, etc., formerly a division of Wayne Co. Purchasing company will remove works to its plant, where space totaling about 100,000 sq. ft. will be given over to oil burner and kindred production. An expansion program will be carried out. Gustave A. Berghoff is president of purchasing company.

Davidson Machine Co., Sullivan, Ind., has leased its present building and will remove works to a new local structure, where capacity will be increased.

Indiana Sanitary Pottery Co., Hammond, Ind., manufacturer of sanitary ware, is considering rebuilding of portion of plant recently destroyed by fire with loss reported in excess of \$200,000, including machinery. Structure will be two-stories, about 150 x 150 ft.

Central Indiana Power Co., Indianapolis, is perfecting plans for a merger with Terre Haute, Indianapolis & Eastern Traction Co., Terre Haute & Indianapolis, and will carry out expansion and betterment program, including transmission line construction.

Highland Iron & Steel Co., Terre Haute, will begin work immediately upon additional plant unit, increasing capacity 25 per cent. Building will be completed about Nov. 1.

Diamond Chain & Mfg. Co., Indianapolis, has completed plans and placed contracts for additional factory unit four stories high that will add 40,000 sq. ft. of floor space to plant. Additional capacity has been made necessary because of the greater use of Diamond roller chain on machinery, and more particularly the high-speed power drive applications. Production of Diamond timing drive chain for motor cars has increased to the point where additional manufacturing space is required for this department also.

Cincinnati

CINCINNATI, Sept. 3.—August proved to be a surprisingly good month for local machine tool builders, sales having been from 10 to 15 per cent greater than in July, which was also above normal for a midsummer month. The high level at which bookings have been sustained in the past 30 days has been caused by lib-

eral purchases by three or four automobile companies in the Detroit district. These transactions, added to orders which have accumulated from companies in many other metalworking industries, lifted an otherwise good month to a high point not approached in any August in recent years. As a result of the heavy buying of equipment, local plants are operating on a large scale and in several instances are employing the greatest number of men since 1919. Indications are that this favorable condition will continue in the near future, because of the impressive volume of unfilled orders.

The first eight months of 1928 have shown a substantial gain over the same period in 1927 from the standpoint of sales. One large builder reports an increase of 35 per cent, although this is considerably above the average for the local market, which is nearer 20 to 25 per cent. Several machine tool executives go so far as to describe this year as a boom period. A number of companies state that their business has come from more diversified sources than at any other time in many years. This naturally is taken as an indication of the determination of manufacturers in many lines to replace tools long obsolete.

An order for special machines, calling for an expenditure of \$100,000 by a Detroit automobile maker, was the largest transaction of the week.

Bids have been asked on general contract by Leland Electric Co., 222 North St. Clair Street, Dayton, Ohio, manufacturer of fractional horsepower motors, armatures, etc., for one-story addition, 165 x 485 ft., with boiler plant, reported to cost in excess of \$225,000, with equipment. Ballinger Co., Twelfth and Chestnut Streets, Philadelphia, is architect and engineer. G. H. Leland is president.

Henry Vogt Machine Co., Tenth Street, Louisville, manufacturer of ice-making and refrigerating machinery, has awarded general contract to H. A. Doll Co., Louisville, for eight-story and basement addition to cost \$350,000, portion of structure to be used for storage and distributing service. D. X. Murphy & Brothers, Louisville Trust Building, are architects.

Memphis Natural Gas Co., Memphis, Tenn., recently organized, is perfecting plans for construction of pipe line from natural gas fields near Monroe, La., to Memphis and vicinity, about 215 miles, where service will be furnished to Memphis Power & Light Co., and other interests, reported to cost close to \$8,000,000. Ford, Bacon & Davis, Inc., 115 Broadway, New York, is engineer. Project will include two compressor stations with capacity of 6100 hp.

Tennessee Copper & Chemical Co., Copperhill, Tenn., has awarded general contract to Ferro Concrete Construction Co., Cincinnati, for addition to plant, 210 x 420 ft., reported to cost more than \$400,000, with equipment. Portion of unit will be used for storage and distributing service.

War Department, Washington, has approved plans for general machine and repair shop, 200 x 300 ft., at Fairfield air depot, near Dayton, Ohio, estimated to cost \$243,000, with auxiliary structures and equipment. Appropriation is expected to be available in near future.

City Council, Paducah, Ky., will secure vote at general election, Nov. 7, for bond issue of \$800,000, for municipal electric light and power plant, for which preliminary plans are being arranged by Burns & McDonnell Engineering Co., Interstate Building, Kansas City, Mo., engineer.

Gulf States

BIRMINGHAM, Sept. 3.—War Department, Washington, has accepted a tract of 2400 acres of land donated by citizens of San Antonio, Tex., as site for aviation school and primary flying field, and will arrange for appropriation of about \$12,000,000, for construction of hangars, machine and repair shops, reconditioning shops, oil storage and distributing buildings and other permanent mechanical units.

Smith Motor Co., Birmingham, Ala., has leased one-story building, 100 x 140 ft., to be erected on local site, for new service, repair and garage building, reported to cost about \$70,000, with tools and equipment. Charles H. McCauley, Jackson Building, is architect.

Milam Chevrolet Co., 435 Milan Avenue, San Antonio, Tex., local representative for Chevrolet automobile, has plans for two-story service, repair and garage building, 100 x 150 ft., reported to cost in excess of \$65,000, with tools and equipment.

Southern Carbon Co., Ouachita Bank Building, Monroe, La., is planning early construction of pipe line for natural gas supply, with compressor stations and other mechanical equipment, in vicinity of Winnfield and Rochelle, La., reported to cost more than \$175,000.

Menefee Motor Co., 2111 Burgundy Street, New Orleans, La., will soon take bids on general contract for new two-story service, repair and garage building to cost close to \$100,000, with tools and equipment. Favrot & Livaudais, Hibernia Bank Building, are architects. James C. Menefee is head.

Pacific Coast

SAN FRANCISCO, Aug. 30.—Contract has been let by Pacific Coast Pulp & Paper Co., Richvale, Cal., to T. B. Hunt, 1510 Thirtieth Street, Sacramento, Cal., for proposed local pulp and paper mill, comprising one, two and three-story units, with power station, machine shop and auxiliary buildings, estimated to cost \$1,000,000, with machinery.

Perfect Caster Mfg. Co., Long Beach, Cal., has awarded general contract to W. Jay Burgin, 1100 Redondo Avenue, for new two-story addition at 3517 East Eleventh Street, 77 x 115 ft., reported to cost about \$25,000, with equipment.

Sweetwater Union High School District, Sweetwater, Cal., plans installation of manual training equipment in new junior high schools, for which fund of \$250,000 has been arranged. T. C. Kistner & Co., Architects' Building, Los Angeles, are architects.

Grand Rapids Store Equipment Co., Portland, has awarded general contract to Stebinger Brothers, Worcester Building, for one-story machine shop at 752 East Twenty-second Street.

Caterpillar Tractor Co., San Leandro, Cal., with branch plant at Peoria, Ill., is perfecting arrangements for consolidation with Western Harvester Co., Stockton, Cal., manufacturer of agricultural machinery. An expansion program will be carried out. Each company will continue to operate present plants.

Simmons Co., 295 Bay Street, San Francisco, manufacturer of metal bedsteads, springs, etc., with main plant at Kenosha, Wis., has awarded general contract to Barrett & Hilp, 91 Harrison Street, San Francisco, for three-story fac-

tory branch and distributing plant on Bay Street, estimated to cost \$200,000, with equipment. Ellison & Russell, Pacific Building, are engineers.

Board of Education, Herald Building, Bellingham, Wash., has plans under way for extensions and improvements in vocational shops at Whatcom County high school, with installation of additional equipment. George Christensen, 2012 G Street, is in charge.

Amateur Screw Products Co., 1265 Sixty-seventh Street, Emeryville, Cal., is considering new one-story addition, reported to cost about \$30,000, with equipment.

Canada

TORONTO, ONT., Sept. 3.—Dealers and tool builders report satisfactory results in sales from machine tools and machinery on exhibition at the Canadian National Exhibition, Toronto. Buyers are showing keen interest in the modern lines of equipment, especially those of high-speed and labor saving types. The fall demand for machine tools is expected to surpass that of spring or summer sales. Small tools are in strong demand.

Interstate Fuel & Light Co., Benton Harbor, Mich., is negotiating with the city of Port Arthur, Ont., for certain concessions and if these are granted the company will build a coke plant there to cost approximately \$3,500,000 for plant and equipment. Fred W. Freese, consulting engineer, Chicago, Ill., is in Port Arthur in the interests of the company.

Bids are being received by W. P. Near, city engineer, London, Ont., until Sept. 11, for the supply and erection of a 400-hp. boiler with underfeed stoker, to be installed in boiler house of Victoria Hospital.

Bids are being received by A. Gray, general manager St. John Harbor Commissioners, West St. John, N. B., until Sept. 12, for construction of superstructure of the \$2,500,000 grain elevator and pier there. Engineers, John S. Metcalf & Co., 460 Helen Street, Montreal, Que.

Border Construction Co., Imperial Block, Walkerville, Ont., has been awarded contract for \$75,000 addition to plant A of General Motors of Canada, Ltd., Walkerville, Ont. Hutton & Souter, 6 James Street, South, Hamilton, Ont., are architects.

Domill Construction Co. of, Canada,

Ltd., 10 Cathcart Street, Montreal, Que., has been awarded contract for construction of a \$12,000,000 pulp and paper mill at Dalhousie, N. B., for the Canadian International Paper Co., Ltd., 100 Forty-second Street, New York.

Quebec Power Co., 229 St. Joseph Street, Quebec, Que., is having plans prepared by the municipal engineering staff for the erection of a gas plant to cost \$175,000.

Steel Containers, Ltd., Victoria and Vancouver, B. C., are making arrangements for erection of plant at Ogden Point piers, Victoria, to cost \$110,000.

Bids are being received by the City of Saskatoon, Sask., until Oct. 10, for steam turbine generator unit of 10,000 or 7,500 kw., alternative capacity complete with condenser and auxiliary equipment. Tender forms and specifications with City Commissioner, Saskatoon, to whom all bids should be forwarded. Andrew Leslie is city commissioner.

Foreign

PLANs are being arranged by General Motors Corporation, General Motors Building, Detroit, for two new assembling plants at Warsaw, Poland, and Bombay, India, respectively, each reported to cost more than \$300,000 with equipment. J. D. Mooney, vice-president, has left for a trip abroad to arrange details of sites, etc.

In connection with hydroelectric power project on Uhl River, State of Mandi, India, Public Works Department, Punjab Government, Punjab, plans extensive increase in initial development, now in progress. The first power station will be equipped for capacity of 36,000 kw., which is to be increased in near future to 70,600 kw., with additional transmission lines to Simla, Patiala, Sialkot and vicinity. Upon completion of the second unit, work will be started on third stage of development, comprising another generating station at neighboring site, with capacity of 48,000 kw., and construction of transmission lines to Meerut, Delhi, Saharanpur and neighboring points. Bids will be asked at intervals for about 400 miles of transmission lines, including towers, cables, etc., to be followed by call for bids for hydraulic pipe lines, waterwheels, transformers, switchgear and other machinery. Specifications will be available at office of Lieut.-Col. Basil C. Battye, Public Works Department, Punjab, chief engineer in charge.

slide type doors for large openings, vertical folding doors, vertical lift and lift-swing doors, fire department doors and doors for airplane hangars.

Charcoal Iron.—Ernst B. Westman, Ltd., London, England. Pamphlet on "Charcoal Iron and Steel, Made in Sweden." The manufacture, purity, resistance to corrosion and other qualities are discussed with illustrations and tables.

Nickel Steel.—International Nickel Co., New York. First of four folders, entitled "Pictorial Panorama of Progress," outlining the use and applications of nickel steel in various industries.

Hoists and Cranes.—Harrington Co., Seventeenth and Callowhill Streets, Philadelphia. Catalog "O" of 84 pages illustrates and describes a wide range of materials-handling equipment, including hand chain hoists, electric hoists, trolleys and traveling cranes. Many particulars are given, including rated loadings, prices, etc., as well as clearance diagrams and other dimensions. Many of the illustrations are from equipment in use.

Handling Equipment.—Northwest Engineering Co., 28 East Jackson Boulevard, Chicago. Bulletin of 40 pages devoted principally to crawler equipment and illustrating a large variety of uses both in excavating and other handling of materials in bulk. Details are given of operating units, as well as drawings and photographs of portions of the machines, showing construction and design details.

Heating Equipment.—Ross Heater & Mfg. Co., Buffalo. Loose-leaf bulletins 133 to 145 inclusive, varying from two to eight pages, all in a folder. These deal with expansion joints and loops of various types, water-heaters, both for storage and feed water, heat exchangers, air pumps, steam jets, etc. Dimensions are given for a wide variety of products, with list prices.

Radiant Oven Heaters.—H. O. Swo-boda, Inc., 3400 Forbes Street, Pittsburgh. Bulletin 130, of eight pages, is devoted to specialties for electric ranges, including heating elements of various designs. Dimensions, capacities, and prices are given.

Motor Control.—General Electric Co., Schenectady, N. Y. Bulletin GEA-451A, of 28 pages, is devoted to control for steel mill auxiliary motors. Illustrations include characteristics, diagrams, wiring diagrams, and photographic reproductions both of installations and of instrument records. The advantages of this type of control are set forth in detail.

Automatic Switches.—Penn Electric Switch Co., Des Moines, Iowa. Loose-leaf catalogs in a folder, illustrating and describing a wide variety of automatic switches and other current controlling apparatus. Sectional views are given, with general specifications.

Air Filters.—Midwest Air Filters, Inc., Bradford, Pa. Folder stressing the advantages of automatic horizontal air filters for industrial purposes.

Steel Containers.—Geuder, Paeschke & Frey Co., Milwaukee. Catalog of 24 pages devoted to container problems and their solution. Maximum shipping safety of contents is stressed, in connection with convenience in use and storage. The containers are designed for a wide variety of liquids, pastes, powders and granulated products, including paints, oils, leads and chemicals.

New Trade Publications

Drop Forging Manufacture.—Interstate Drop Forge Co., Capitol Drive and Twenty-seventh Street, Milwaukee. Four-page folder describing briefly the process of die sinking, allowances for draft and shrinkage, checking the lead cast, and manufacture and cleaning of the drop forging.

Spot Welders.—Federal Machine & Welder Co., Warren, Ohio. Bulletins No. 250 and 260 on "Junior" and "heavy duty" spot welders, respectively. The former have throats up to 24 in. deep and 15 kw. transformer capacity, thus being able to weld two pieces of ½ in. steel or iron together. Heavy duty welders start with 20 in. throat, 20 kw. capacity, capable of handling two pieces of ¾ in. metal, and from there on up. Universal welding point holders increase the ability of the regular line of equipment to handle a wide variety of work.

Speed Transmissions.—Reeves Pulley Co. of New York, Inc., 76 Dey Street, New York. Leaflet briefly describing variable speed transmission units, dealing in particular with new designs which have recently been developed.

Concrete.—Celite Products Co., Los Angeles. Folder 338 devoted to Celite concrete. Instruction for mixing and various other information is included.

Unit Heaters.—Bishop & Babcock Sales Co., Cleveland. Catalog dealing with Massachusetts modified unit heaters. Illustrations, diagrams, tables of specifications and full construction details are included.

Steel Doors.—Truscon Steel Co., Youngstown, Ohio. Catalog devoted to copper alloy steel doors. Illustration of various types and specifications and drafting room standards are included. The line embraces industrial swing and

THE IRON AGE

Single Stamping Makes Sedan Side

Larger Units Simplify Production, Increase Accuracy and
Enable All-Steel Body to Function as Stress-
Carrying Portion of Chassis Frame

BY E. E. THUM

IN an article in THE IRON AGE of Sept. 22, 1927, an account was given of the steel requirements for the manufacture of all-steel automobile bodies. A pioneer in this method of construction, the Edward G. Budd Mfg. Co., Philadelphia, has found it necessary to meet and solve many problems, not only in steel qualities but in fabricating machines and methods, in which its own staff has received hearty cooperation from steel makers and equipment manufacturers.

As in many other modern developments, the trend is from the complex toward the simple. All-steel automobile bodies, even in their early developments, contained fewer parts than the composite body, which is a skeleton made of a number of pieces of wood, mortised and framed together, and covered with thin sheet metal. In fact, by virtue of the ability to weld together various sheet metal stampings into larger assemblies, the all-steel body could be looked upon as an assemblage of a dozen sub-assemblies, so arranged that the joints blended into the striping and beading decorating the exterior.

Steel Body Now a Stress-Carrying Unit with Chassis

It was apparent, however, that the full value of steel as a structural member was not being utilized in these designs. The older steel bodies were in effect self-supporting inclosures bolted to the chassis frame, which latter was de-

signed to carry the stresses, warping and weaving, of the moving car. The logical development is suggested by the question: Why not throw some of this work upon the steel of the body, instead of carrying it along as so much dead weight?

Analysis of this problem indicated that such a design would require a one-piece side, considerably stiffer against buckling than the older design, and attached securely to the side of the chassis frame so as to transmit the necessary forces. It also required that the rear body, the cowl, even the instrument board, be fixed into the structure and act as cross bracing against sidewise forces, and make both sides of the structure carry stresses originating from any pair of wheels. When this idea was carried to its ultimate conclusion and all parts of the body were designed to carry a proportionate share of stress, it was found that the weight of body plus chassis frame was reduced, that the center of gravity was lowered, vibration was lessened, and the "balance" of the moving car improved.

Such material and intangible advantages are the direct result of a determination to use the steel in a car body as a stress-carrying material, in addition to its original functions of keeping the weather out and providing a foundation for a pleasing color scheme.

This advance has also brought about a considerable simplification in manufacturing operations. The outer side sheet

of a steel body itself (as well as the cowl) used to be an assemblage of several smaller stampings welded together. Now each side is pressed from a single large sheet. Final assembly now consists essentially of erecting two sides, a rear, a cowl, and rear seat pan. (The floor and front seat are carried by the chassis.) In this manner, as is so often the case, an improvement in utility has resulted in a change from the complex toward the simple.

As an instance of the older method, take the sketch of a cabriolet side (Fig. 1). It could readily be made of three stampings, the roof panel *A* welded to the rear quarter *B* by a flash weld at seam *K*, and this part then fixed to the side panel *C* along an inner lap seam *a* by a number of spot welds, as shown in section *x-x*. This side unit, properly fitted with hinges, upholstery lugs, seat brackets and miscellaneous hardware, would then be connected to the cowl *D* by welds *f* at the top of the windshield frame and by a sill *E* at the bottom.

Large Sheets Simplify Manufacturing Problems

In the new design parts *A*, *B*, *C*, *E*, and their strengthening flanges, are in one piece, as shown by the photograph of the sedan side sheet, Fig. 2. Not a single joint in this piece. While such a production requires a line of very large presses, with correspondingly large dies, it avoids much making and fitting of smaller pieces, and expensive filing and smoothing of exposed welds. It might appear that the door and window openings would make an undue

amount of scrap, but on account of the heavy flange forming the door frame, clearly shown on the inside view of Fig. 2, the actual opening punched from the flat sheet is not excessive and much of the metal is utilized in making smaller parts. Some of the steel apparently missing has been turned inward where it will be useful in carrying load. Furthermore, the amount of losses through edge trimmings on a single large piece is much less than the edge trimmings for a number of smaller pieces, welded together to make the large one.

At any rate, the alternative of making a single big stamping or welding together a number of smaller ones had to be decided by balancing the cost of welding jigs, plus the welding and finishing labor, against a possible increase in tool cost in the press shop. Apart from a comparison of costs, a one-piece stamping is better able to withstand the stresses of service than a jointed piece, even though the joints are "100 per cent" welds.

It has not been easy to build up a set of dies that will make such a stamping as is shown in Fig. 2 without splitting or wrinkling the sheet at a corner (nor has it been a simple matter for the steel makers to produce deep-drawing stock with excellent surface in sizes as wide as 66 by 100 in.). But the Budd tool engineers have succeeded so well that they now find other production problems to be simplified by handling a few large stampings rather than a greater number of small ones.

A collateral advantage of importance has been found in final assembly and shipment, which can be explained as follows: Some variation in size is inherent in any fabricated piece. Thus, each stamping has a tolerance of a small fraction of an inch (which may be denoted plus or minus *T*) largely due to the varying "springiness" of in-

Fig. 2—Outside and Inside View of Sedan Side Sheet Made From a Single Sheet, 66 x 100 x 0.043 In. Drip molding and a few door fittings have been welded in place. An inner reinforcing wall of smaller parts will later be welded on, to give rigidity against lateral buckling

Fig. 1—Older Method of Making Side Sheet from Several Small Stampings

Fig. 3—Front Quarter of Car Is Made of Cowl (Center, a Single Stamping). Inner Diaphragm, Dash Board and Floor Brackets

dividual sheets. Each welding operation has a tolerance (plus or minus t) due to play in the fixtures, clearance between work and fixture, and varying shrinkage from varying welding heat. Sometimes in assemblies such as shown in Fig. 1 these plus errors cancel the minus errors, and the side sheet is close to theoretical size. But there is the possibility that the errors may be cumulative, and the final tolerance of the cabriolet side sheet, consisting of three stampings and two welds, must be plus or minus $(T_1 + T_2 + T_3 + t_1 + t_2)$.

Obviously such accumulations in errors are avoided in single stampings. A single tolerance governs. This means not only that a steel door made of a single stamping will fit the opening and hang accurately in its frame (also a single stamping) with a minimum of fitting—and a large amount of expensive skilled labor is saved on this item alone—but that the four units which now make up a body—namely right and left side, rear, and cowl—may be nested in a freight car, shipped in maximum carloads and assembled economically elsewhere.

In Shops Smaller Units Are Placed Near Big Presses

Manufacturing operations at the Budd works follow the routine seen in any well ordered metal fabrication plant, somewhat magnified by the size and quantity of material handled. Presses range in size from a line capable of working the 66 x 100-in. sheet for a sedan side to small ones for the minor fittings. Many of the important machines are double acting, with finger dies mounted on air cushions to aid in alining the work and equalizing the pressures on all parts of the die and throughout all parts of the stroke.

The press shops are roomy, and the massive units are spaced far enough apart so that smaller machines can be moved up to the proper place to put in a hole or two or make a bending operation as required. In this way much back-tracking is avoided, while wide aisles and side bays permit grouping of machinery without interfering with transport of material in process.

Materials Handled in Variety of Ways

Metal in process is handled in a variety of ways adapted to its shape and size. Flat sheets are carried on flat-bottomed four-wheeled wagons. Scrap is loaded into metal box cars with open tops and small casters. Stampings that nest closely together are stacked on raised platforms and moved by electric lift tractors. Door frames are hung on special truck bodies with appropriate cross-arms. Storage battery motors are used for transport; elevators are large enough to handle two two-car trains. Such equip-

ment is most flexible, and can be adapted with ease to the requirements of changing production.

All Joints Made by Welding

Steel doors are made in such quantities that a special shop is utilized for door construction exclusively, complete with press department, welding machines, inspection and finishing floor. Another section of the plant is devoted to cowl. In the most advanced design the cowl is made as shown in Fig. 3. The cowl proper and windshield frame, which carries the exterior finish, is a single piece. It is stiffened into a load-carrying structure by an inner diaphragm, punched for lightness and made of several smaller stampings. Welds in the latter are placed where they will be covered by inner trim, and in this way some scrap from door and window openings is utilized. The same may be said of the dash board or false cowl, which strengthens the front assembly against racking.

These various sub-assemblies are welded to the combined cowl and windshield frame by a series of resistance spot welds, made in specially developed fixtures and machines, leaving no mar on the exterior surfaces. In this way the front end of the all-steel body is manufactured into a single rigid unit.

Minute inspection is given such units as they progress and also before shipment, not only for size and shape, but also for surface finish. Minor defects are corrected by hammering and filing. To avoid an undue amount of such work it is essential that the outer sheets come from the presses without wrinkles, and that much care be exercised in handling the metal in all further stages. There are ample opportunities for sheet metal to meet the protruding edge or corner of a machine, a truck, or another piece, and each such collision leaves a small dent, sometimes almost too small to see, but one which must be removed before the panel can be given the smooth mirror-like finish demanded by motorists.

Finishing Operations Require Scrupulous Cleanliness

To prevent rusting in transit, the bodies or body-sections ("in the white," as they are termed) are oiled inside and out with a fine spray. After reaching the finishing departments they are again inspected for any damage that might have occurred in transit.

Subsequent finishing operations first require scrupulous cleanliness. The body goes through an electric oven to burn off the oil. Then it is washed with a chemical cleanser, scrubbed with steel wool, doused in cold water and again in hot water. After drying, the body gets a coat of priming paint, a 2-hr. journey through an oven, and then a second priming coat and drying. Then the body is carefully and

thoroughly smoothed with fine emery and running water—the most laborious process in the whole course of manufacture. Three double coats of lacquer are then sprayed on, each coat being followed by a trip through a long drying oven. Then comes a second rubbing with fine emery paper and oil, and a last spray of colorless solvent to remove scratch marks.

After the upholstery is placed, the interior panel work done, the top covered, the hardware placed and the glass set in the trim shop, the body is polished all over with a powdered abrasive in wax, and rubbed down with woolen cloth. Reaching final assembly, it is lowered over the chassis frame, and connected with it by a series of horizontal bolts.

Chinese Nail Mill Proves Profitable

Kung Chin Iron Works Operated for Eight Years Despite Civil War
—Employees Receive Bonuses Based on Output

BY K. F. HWAN*

DESPITE the civil war in China, which, with poor management, has contributed to the lack of financial success of most of the Chinese iron and steel plants, such as the great Hanyang Iron & Steel Works, Hankow; a small nail mill at Shanghai, the Kung Chin Iron Works Co., Ltd., has managed to maintain operation since 1920 with a fair degree of success.

Following graduation from a German technical institute in 1920, the writer determined to promote the iron and steel industry in his native country to the best of his ability and, with the aid of family and friends, was able to establish this plant with capital stock of \$200,000 (Mexican). In 1925, financial aid was required and a prominent merchant of Shanghai came forward with assistance, which has permitted the gradual increase of capacity for nail making to 49 nail machines and 18 blocks of various sized wire-drawing machines.

In establishing the mill, the writer was aided by his instructor at the German technical school from which he was graduated, Professor Berrus, who shipped eight German nail-making machines to the plant for trial. A year and a half of production proved that a nail mill could not operate profitably without its own wire production. So, with considerable difficulty, a wire-drawing machine of simple construction was built with belt drive and a block 20 in. in diameter, permitting the drawing of No. 5 gage wire rods into No. 10 gage wire. At that time, however, our knowledge of pickling was rather incomplete, so that many mistakes were made during the ensuing year. The results, however, were finally quite satisfactory, so that today the plant is operated on a full 24-hr. day schedule with 130 workmen on 11-hr. shifts, in addition to which there is a small group employed in the keg-making plant, which has a capacity of 500 kegs a day.

The pickling department of the plant consists of three acid tanks, 5 x 7 ft. x 4½-ft. deep, a rotary steam hoist at the center of these acid tanks for handling the cleaned and uncleaned rods, a lime pot, two water tanks, a rusting frame and three annealing furnaces, all served with a monorail system equipped with a 1-ton electric hoist, which delivers rods directly to the storage section.

Being immediately adjacent to the wire-drawing plant, the rods are easily carried to the wire-drawing machines by an overhead crane and chain hoists equipped with strippers for lifting the finished drawn wire. The wire is then bound with wire shorts and piled on a small truck on a shop railroad, from which the bundles are taken and weighed separately according to gage. The plant railroad is laid directly to the nail-making plant, in which there are 10 Sleeper & Hartley machines, eight German crank presses, three German Malemedie-type machines, 26 Wood spring machines and two new German Jacob machines.

The Jacob machine is a recent German development in

nail-making machinery, which, we have found, saves us from 2½ to 3 per cent of waste in producing nails of two-point chips, as the machine has round cutter and gripping dies to press the chips and form the heads of the nails following the blow of the heading die. The machines cost \$600 for the patent and \$800 for the smallest machine, making the total cost \$1,400 for each unit for nails of 1¼ in.

The nail machines are secured to a heavy timber floor, and nails as they come out drop through a hole in the floor into nail bunkers, from which they can easily be removed by opening a sliding door. From the bunker the nails are removed with a special scoop handled by an electric hoist and are placed on a scale for weighing, a coolie recording the weights by stamping them on a daily production sheet. The nails are then carried directly to the polishing department.

The cleaning barrels in the polishing department are arranged on a second floor of the room, and under this floor at each barrel there is a large nail bunker with a capacity of 15,000 to 20,000 lb. of nails. When the nails are polished, the doors of the nail bunkers are opened and the nails drop into the kegs, which are then headed and delivered into the "godown" (warehouse) ready for shipment.

A brief mention of our method of handling labor may be of some interest to Western readers. The fitters, foremen, operators and coolies are all entitled to a special monthly bonus for their diligence. The wire drawer, in addition to a fixed rate of wages, may receive a certain amount of his production in addition, based on the daily production sheets for his machine, and an extra bonus on savings in defective wire if he draws none more than 5 mm. in gage in a day.

Each nail operator, in addition to his regular wage, is in a position to receive a daily production bonus, a continuous production bonus and a small premium on saving cutters and dies. Every nail machine operator is given a monthly allotment of 10 pairs of cutters and 15 pairs of gripping dies. The repair foreman and his fitters also receive premiums on reducing repairs to machines, and the production foreman receives a bonus on maintaining a high rate of output. The works manager has a bonus based on direct savings in manufacturing costs.

We have every reason to believe that the personnel of our plant is well satisfied with this system, which has been gradually developed with the intention of benefiting both the workmen and the company. In consequence of our success in handling our labor and their general satisfaction, we feel that the charge of cheap and slow-moving Chinese labor cannot be brought against us. Of course, our wage rates are low, but our high efficiency is a large factor in our costs.

When our Nationalist Government has finally unified the South and the North of China, we believe that there will be a decided shortage of materials, such as wire and nails, and that a general improvement of Chinese industry will ensue, in which our plant will participate.

*Works manager Kung Chin Iron Works Co., Ltd., 53 Linching Road, Shanghai, China.

Stainless Iron for Naval Aircraft

Suitability of Two Types Investigated—Physical and Anti-Corrosion Properties Reported on Favorably—
Good Fabricating and Machining Qualities

BY EDWIN JOYCE*

STAINLESS iron and steel alloys have for some time been attracting the attention of metallurgists because of the excellent physical properties combined with excellent resistance to corrosion which manufacturers claim for these products. In order to ascertain the suitability of these alloys for naval aircraft construction purposes, an investigation was made at the Naval Aircraft Factory with the results recorded in this article.

A preliminary study of the properties of a number of alloys of the stainless iron and steel class resulted in the conclusion that stainless steel would not have sufficient ductility and, if heat-treated to have the properties of S.A.E. No. 2330 nickel steel, would not resist corrosion by salt water. Stainless steel is more difficult to machine and fabricate than stainless iron and would require an excessively high heat-treating temperature (1850 deg. Fahr.), which would almost preclude the use of brazed joints.

There are several types of stainless iron on the market, differing to some extent in composition, and certain dis-

tinctive advantages are claimed by the manufacturers of each. However, there exists a difference of opinion among manufacturers as to the merits of the modifications and decisive data are desirable. From the types available, two were selected for test work because of their more promising qualities and because both bar and sheet stock of the same composition were available from each source. One of these alloys is designated "A," and the second "B," both made by the electric process. Typical analyses of these, in percentages, are as follows:

	Carbon	Manganese	Phosphorus	Sulphur	Silicon	Chromium	Nickel
"A"....	0.10	0.42	0.017	0.018	0.23	12.3	0.19
"B"....	0.04	0.22	0.016	0.016	0.33	13.4	0.13

The carbon content of stainless iron alloys is low—not exceeding 0.12 per cent. By common consent among manufacturers, when the carbon content of such alloys does not exceed the above amount, the product is sold under the trade name of stainless (or rustless) iron. Most of these, however, are capable of being hardened and tempered and

[In the tables Hb indicates Brinell hardness; Hr, Rockwell hardness; Hs, Scleroscope hardness.]

are therefore more properly steels, but the custom in nomenclature is now fairly well established.

Standard tensile test specimens were prepared and subjected to various heat-treatments before being tested in tension. Stainless iron "A" is air-hardening, and the values given in Table I are the average results of tests of two specimens which were air-quenched and tempered at temperatures recommended by the manufacturer. In this and in subsequent tables are given the results of bend tests, which indicate the angle through which the specimens bent over a radius equal to the thickness of the metal before failure occurred. All heat-treated specimens were held for at least 30 min. at the quenching and tempering temperatures in order to attain equilibrium conditions in the metal.

Alloy "B" is not air-hardening, and the results of tests after heat-treatment as recommended are given in Table III. For purposes of comparison, "A" specimens were treated in the same manner, with the results given in Table II. The quenching medium, with the exception of the air-quenched specimens, was an oil which had been found suitable for general quenching purposes. These results did not appear as favorable as was expected, and more comprehensive tests were made to explore thoroughly the quenching and tempering ranges, with the results as indicated in Tables IV and V, and as shown graphically in the illustration.

In some of the accompanying tables are given the results of corrosion tests. Specimens were exposed to the corrosive action of salt water (20 per cent NaCl) spray in a sealed wooden box, fitted with an air atomizer so that they hung for the periods mentioned either in the mist or in the saturated air in the tank. During 8 hr. of each 24 hr. the specimens were under spray conditions. They remained moist during the remainder of the day, but the rate of corrosion was perhaps retarded during the period in which the spray was not used.

The corrosion scores assigned to the various specimens, as shown in the tables, represent only an approximation

of the true condition, because the ratings were based on visual examination only. The specimens were arranged in a series in which the position of each was determined by its appearance. The ratings are considered sufficiently accurate for purposes of comparison. Some of the corrosion specimens were the fragments of tensile specimens; others were corroded before tensile testing, in which case the ill effects of corrosion may be noted by comparison of their physical properties with those of corresponding untreated specimens.

In Table VII are given the results of tests of heat-treated 3 to 4-in. round bar stock. The quenching and tempering temperatures used were those which previous tests of sheet stock indicated most suitable. The physical properties of normalized and annealed sheet are given in Tables VII and VIII. The low proportional limit and yield point of the normalized specimens should be noted.

Both butt and flange-welded specimens were used to determine the weldability of these two stainless irons. After welding, the samples were quenched at 1650 deg. Fahr. and tempered at 800 deg. Fahr. No flux was used in making the joints and the filler rod was cut from the stock being welded. Flange-welded "A" specimens of 1-32-in. sheet, 1 in. wide, broke under loads ranging from 1750 to 4020 lb. The corresponding range for "B" specimens was from 1595 to 4070 lb. The breaking loads for "A," 1-32 by 1-in. butt-welded specimens, ranged from 4170 to 8820 lb. and for "B" specimens from 2625 to 7810 lb. These values indicate that some difficulty may be expected if welding is undertaken by an operator unfamiliar with stainless iron. Instructions are furnished by some of the manufacturers and should be made available to the operator. Electric spot welds are readily made to withstand loads averaging 1500 to 1600 lb. for "A" and about 1500 lb. for "B" 1-16-in. sheet.

Brazing of stainless iron of all grades is rather difficult because the brazing brass does not flow readily into the spaces between the parts being joined. The brazing brass does not seem to "wet" the surface of the heated iron, and part of the openings which should be filled by capillary attraction remains unfilled and constitutes a source of weakness in the brazed joint. Both flame and dip-brazed specimens were prepared for tests. The flux used was a mixture of borax and boric acid and was not very satisfactory. The dip-brazed specimens were preheated in flux baths until they attained a temperature of 1860 deg. Fahr. and were then immersed in the molten brass (70-30 copper-zinc). Flame-brazed joints were made in the usual manner with an oxy-acetylene torch. The area of the lap in both cases was approximately ½ sq. in., which should have given the joints a breaking strength in shear of 12,000 to 15,000 lb. The average for "A" specimens was 9000 lb. and for "B" slightly less. Some specimens broke under loads 1000 to 2000 lb. above or below the average. Breaking loads for flame-brazed specimens averaged about 2000 lb. less than

Longitudinal and two transverse. All specimens were cleaned.												

Each value represents the average of four specimens—two longitudinal and two transverse. All specimens were cleaned of furnace scale before starting corrosion test. Corrosion period—30 days. All Brinell readings were taken with 3000-kg. load except those marked with (1) which were taken with 1500 kg. load.

for dip-brazed joints, and there was a greater difference between the maximum and minimum loads.

Both types of stainless iron were soldered without difficulty. The surfaces may be readily cleaned by application of dilute hydrochloric acid saturated with zinc, or by pickling with dilute hydrochloric acid. Zinc chloride, or "Hull" flux, may be used with about equal results.

Neither "A" nor "B" stainless iron was difficult to machine or to form when in the annealed condition, and parts have been machined from "A" alloy which had a Brinell hardness indicating 125,000 lb. tensile strength. Cutting tools should be high-speed tool steel and attention should be given to their shape and position in order to avoid a rough finish due to dragging. The corrosion-resisting properties of stainless iron make its use most attractive and, although it is not so resistant as some of the higher chromium alloys, it is considerably better than some of the commonly used alloys of similar strength.

The results of the above-mentioned tests indicate that attention should be given to the heat-treatment temperatures used in order to bring out the maximum resistance of the alloys. This is particularly true of "A" iron, which suffered by comparison with "B" except for "A" specimens which were tempered at 800 deg. Fahr. The relationship of the tempering temperature to resistance to corrosion was not studied as thoroughly as desirable, but enough work was done to indicate a decided decrease in rate of corrosion with decrease in tempering temperature.

The results also indicate that the tensile properties of these two types in the annealed condition are considerably better than those of mild steel and that the ultimate strength of normalized stock exceeds that of normalized medium-carbon steel. The strength of hardened and tempered stainless iron, combined with its capacity for resistance to corrosion and its fabrication qualities, has led to its use in the manufacture of aircraft parts. This application is expanding gradually and, up to the present time, no serious difficulty has been experienced in its use.

Time Saved by Transmitting Blueprint by Telephotograph

THE attached photograph is a reproduction of a telephotograph order transmitted from St. Louis to the Chicago office of Joseph T. Ryerson & Son, Inc. It calls for 1890 reinforcing bars with 1100 bends, 7300 bar ties and 14 rolls of wire mesh that were needed immediately for the construction of a reservoir at La Rose, Ill., for the Sinclair Pipe Line Co., Tulsa, Okla. The order was given in blueprint form to W. T. Branson, Ryerson representative at Tulsa, and as it could not be delivered by telephone, he dispatched it immediately by mail to the company's St. Louis office. As La Rose, Ill., could be served quicker from Chicago, the order was telephotographed from St. Louis to the Ryerson Chicago office. The accuracy of the wired photographic system made checking or confirmation unnecessary, and the material was ready to ship in 1 hr. 25 min. Dispatched late in the afternoon, it reached La Rose the following morning.

A Thousand Apprentice Tool Makers

Apprentice School Has Class Rooms and Laboratories Within the Factory and Students Divide Time Between Instruction and Production

BY FAY LEONE FAUROTÉ*

A Typical Class Room, Easily Accessible from the Main Factory

STARTING as a simple toolmakers' course in 1923, the Ford apprentice school in Detroit has grown until today it is a thriving industrial college with four major courses in its curriculum and two post-graduate courses available to those who may have shown exceptional ability and are desirous of becoming specialists in their lines.

The four main courses, which cover a period of two years and a half each, are tool making, electrical engineering, metallurgy and metallography, and steam engineering. The post-graduate courses are in tool and die design and in electrical design and drafting.

The apprentice school is entirely separate from the Ford trade school, the latter institution being intended for the training of boys from 12 to 16, who are not yet able to work in the shops or not fitted by education to take the advanced work given in the apprentice course. The two schools are quite distinct in character. The trade school

*Mechanical engineer, New York.

and shops, for example, are entirely separate from the factory, while in the apprentice school the pupils are actually engaged upon production work alongside experienced workmen, tool makers and engineers.

Entrance requirements to the apprentice school are simple. The applicant must be an employee of the Ford Motor Co., pass the entrance examination, be willing to comply with requirements, disciplinary and otherwise, and not be over thirty years old. He may then secure in some two and a half years of steady work and application a fund of knowledge and a facility of practice attainable in few places elsewhere.

Naturally, the pupils are drawn from boys and men with varying educational backgrounds. Some have completed only a few grades in a common school, others are graduates of colleges and universities. The school takes them all, determines their capabilities, classifies them, sets suitable tasks and aids them in every way possible to complete their courses with credit to themselves and the school.

The Younger Apprentices Are Segregated for the First Few Months. View shows a special lunch room for their exclusive use

Boys With No Previous Training in Machine Shop Work Are Given Elementary Exercises on Modern Tools Until They Become Skilled Enough to Enter the Production Line

The preliminary examination is a simple one, largely concerned with mathematics, and is intended only to eliminate those who could not possibly handle the theoretical work given as a companion part of the practical courses.

During the summer of 1928 the Ford apprentice school had a total attendance of 1480, distributed among the four courses and the two post-graduate courses as follows:

<i>Elementary School</i>	
Toolmaking	1,030
Electrical	316
Steam engineering	36
Metallurgy	68
<i>Post-Graduate</i>	
Electrical drafting	14
Tool and die design	16
Total	1,480

The teaching staff is composed of instructors most of whom are university graduates. Some give their full time to the educational work, others divide their time between administrative work in the production shop and teaching in the school. All of them are well acquainted with the most advanced practice. Their ability to requisition the factory stockrooms for the very latest types of mechanism, latest samples of new materials, actual working drawings of every kind and character—these advantages and facilities make the school's instruction comprehensive and timely.

It will be appreciated that the scheme of instruction is

similar to the cooperative plan introduced by Dean Herman Schneider of the University of Cincinnati, and widely copied elsewhere, wherein the student spends alternate periods of time in the classroom and in the shop doing the everyday tasks of production. In the Ford school this alternation is daily.

The classrooms and laboratories are located in main manufacturing buildings within the Ford plants and are readily accessible to those boys and young men who are using them. Class hours for instruction and laboratory work are arranged so they will not interfere with the working periods, at the same time making it possible for the pupils to go directly from the shops to their study rooms or vice versa without returning to their homes between times.

These class hours are set so that no matter which shift the student is working he will have suitable times for his theoretical training. At the present time the schedule for classes is as follows:

- 1.45 p. m. for No. 3 shift (afternoon).
- 3.45 p. m. for No. 2 shift (day).
- 8 a. m. for No. 1 shift (midnight).

Manual training is thus done in the line of production. Mental training is done in large measure by means of answer sheets. That is, the problems are assigned and explained in the classroom while the work is done outside.

Tool Maker Apprentices Before Long Work Shoulder to Shoulder with Skilled Mechanics in the Ford Plant Tool Rooms

Only the answers are brought in for credit and grading. It is expected that problems receiving non-passing grades (less than 70 per cent) will be reworked and returned with the new lessons on the following class day. Explanation sheets, which will supplement the work of the instructors, are issued to help with homework. Despite the fact that the theoretical work given is of a high character, the percentage of failure is small. In passing, it may be said that only those who are eager to attain a good grade in their work are apt to be accepted or remain in the school.

Recognized school and college texts are used for textbooks. Smith's "Advanced Machine Work," for example, provides some eight lessons in the theory of tool making and operation. For steam engineering and power plant work the well-known textbooks by Crofts are used, while for the metallurgical and metallographical course a special textbook written by Ford engineers and instructors, but following closely the work of Sauveur, is provided.

The latter course starts out with a study of elementary chemistry, physics (heat and its measurement), the physical properties of metals like strength and hardness; then it takes up briefly the methods of production of iron, steel and other alloys. Finally consideration is given to hardening

practice and theory, forge and foundry work, and finishing operations such as cleaning and plating.

At various stages as the student is shifted from one job to another in the shop, or completes sections of the course, his foreman or instructor is expected to sign his record card and comment upon his ability, faithfulness and general character. When he completes the specified course he is given a certification or graduation card signed by the department foreman, department instructor and the superintendent of the school.

Upon graduation his employment is not mandatory, but approximately 90 per cent of the graduates stay on from choice. Records show that the graduates readily progress into positions of importance and trust, either in the Ford Motor Co. or in the Government service, in colleges, schools, or other industries.

Because the boy's technical education has been accomplished, at least in part, in the exact environment in which his further progress may be made, the graduate finds the period of transition into the world of business less difficult. He has learned how to get along with men and acquired that feeling of independence which the possession of accurate up-to-date knowledge gives.

High Price of Special Steel Prevents Wide Use

Chemical Industry Needs Slow-Rusting Steel, Made in Tonnage, to Develop 90,000 Lb. Ultimate and 35 Per Cent Elongation

BY T. MCLEAN JASPER*

IN selecting metals for chemical service it is presumed that great emphasis would be placed on steels with high alloy content to take care of the unusual chemical requirements due to corrosion and high temperatures. As a matter of fact, most steels of high alloy content are so expensive that many of the special problems of the chemical engineer are being solved by using the less expensive steels in vessels for carrying the load, lining them with alloy steel, or with something other than steel, for resisting corrosion. There are also added difficulties in the fabrication of high-alloy steels, especially chromium steels.

It would seem, therefore, that the cost of high-alloy steels, and the difficulties encountered in their fabrication, will restrict the use of such steels to a relatively small proportion of the containers and pressure equipment. Much larger possibilities would exist if economical means could be found for the production and fabrication of such alloys.

Much Misinformation Being Circulated

The fact that there are so many conflicting reports as to what such alloy steels can perform under service makes it appear that many of the producers of steel are not acquainted with the actual facts. It is very desirable that the pertinent facts covering the use of such steels should be obtained more accurately and made available to those interested.

The large percentage of the world's loads have been carried by ordinary carbon steels, and at the present time this class of tonnage steel has been developed to a point where it is probably yielding the largest possible return in terms of strength and ductility.

There is, however, a great need for a steel that, without heat treatment, will possess an ultimate strength of 90,000 to 95,000 lb. per sq. in., yield point 60,000 to 65,000, and a

ductility represented by 30 to 35 per cent elongation. If this steel can have the added quality of being more corrosive resistant than carbon steel, it would be more useful yet. Plain carbon steels meeting the above strengths fall considerably below the above figures in ductility when made by the present tonnage methods. If the new steel could be produced to compete with carbon steel on a cost basis per 1000 lb. per sq. in. strength, a very large use indeed could be found for it.

Should Standardize Tests at High Temperatures

The question of strength of steel at high temperatures and the question of designs and shapes to utilize such steels most economically are of great importance to the chemical engineer. There is also a great need for a clarification of methods of testing at elevated temperatures that will produce consistent results in the many laboratories engaged in this work. There seems to be considerable difference of opinion as to which test results should be considered as being most reliable. The writer is of the opinion that the factor of safety of large equipment should be based on the ultimate strength, because it is the value which can be most accurately obtained. In some mechanical equipments the stress beyond which fairly large strains occur is also an important factor to determine. No stress should be allowed in any equipment that allows large strains to exist during the life of the equipment, and for this reason a simple method for obtaining a reasonably reliable value is needed.

Another important factor entering the value of steels when used to resist chemical corrosion is the knowledge of what such steels will do under working conditions. The laboratory test that does not take into consideration the actual conditions of service will often fail miserably in selecting the best steel for the purpose. A steel that is to be used to carry load as well as to resist the effects of corrosion must be tested under appropriate load, temperature and corrosion conditions.

*Director of research A. O. Smith Corporation, Milwaukee, Wis. From a paper read before the American Chemical Society at Northwestern University, Evanston, Ill.

Use of Electric Power in Iron Mining

Increase in Lake Superior District and Effect on Ore Output—Electric Shovels for Open-Pit Mines

BY A. C. BUTTERWORTH*

PROBABLY the first mine in the Lake Superior district to be completely electrified was the Penn mine at Vulcan, Mich., electrification of which was started in 1906. In 1910 the Cleveland Cliffs Iron Co. started extensive electrification of its properties in and around Ishpeming, Mich. In 1912 the Davidson and Bengal mines at Iron River were completely electrified, these being the first mines to operate entirely on purchased power. In 1913 the Oliver Iron Mining Co. built a hydroelectric plant at Quinnesec Falls on the Menominee River below Iron Mountain, Mich., for furnishing power for a set of 3000-gal. centrifugal deep-mine pumps in its Chapin mine.

In 1910 there probably was not a mine in operation which did not make some use of electric power, although there were few motor-driven hoists and compressors and not many motor-driven pumps. The next ten years saw a complete reversal of conditions, so that, after the slump of 1921, with few exceptions, the underground mines that resumed operations either had already been completely electrified or were in process of being changed over to electric drive.

Use of electric power in the past five years has continued to show an increase, which appears to be reflected directly in increased efficiency. In 1922 a group of 12 representative underground mines, nine of which were completely electrified, and the others partly electrified, showed a power consumption of slightly less than 4 kwhr. a ton. In 1927 a group of 16 mines showed a power consumption of slightly over 8 kwhr. a ton.

Although the use of electric power cannot be credited with the entire increase in efficiency, it is interesting to note that, coincident with the foregoing increase in power consumption from 4 kwhr. to 8 kwhr. a ton, the mining efficiency, as expressed in tons per man was nearly doubled.

Pumping, Air Compressing and Ventilating

For 1927 the pumping power for the group of 16 electrically equipped mines amounted to about 40 per cent of the total power consumption. For every ton of ore produced, 2½ tons of water was pumped a vertical distance of 1000 ft. The sum of the hoisting and pumping power amounted to approximately 50 per cent of the total power.

Power used in compressing air is, next to pumping, the largest single item and amounts to about 35 per cent of the total power. Compressing air by electricity is one of the most expensive ways of using power, unless constant attention is paid to the matter of leaks, proper sizes of air lines, and the question of overtime operation. For individual mines the power consumption per ton varies from 1.5 kwhr. to 10 kwhr., depending on the extent of the air-distribution system, number of hours during the month in which the compressor is running, condition of underground ventilation, type of mining equipment and method of mining being used, and to a certain degree the character of the material being mined.

More and more attention is being paid to mechanical

ventilation of mines. There is not the necessity of getting rid of explosive gases, which exist in some coal mines, but the heat and the carbon dioxide due to decaying timber matting, together with the powder smoke underground, make it necessary to pay attention to this problem. In the early days many mines had reasonably good natural ventilation, but with the increased depth of mining even those mines are now turning to mechanical ventilation. Many devices have been tried out to improve local ventilation in exceptionally poor places. Direct blowing of compressed air and the use of air "injectors" and air-operated fans and blowers have generally given way to the latest type of portable motor-driven ventilating fans. The trend of this work, however, is toward the large mine-ventilating unit, together with a proper system of air doors throughout the mine, to give adequate and positive ventilation everywhere in the mine.

Slushing Hoists a Great Improvement

Perhaps the factor of greatest importance in the last six years in increasing mining efficiency has been the development of the slushing hoist and its adaptation to the problems of mining. The earliest equipment consisted of a small steam-operated hoist pulling a scraper such as was formerly commonly used in general excavating work on the surface. From this beginning the equipment has been developed successively through refinements of the air engine and final application of electric drive, so that now practically all underground mines have slushing hoists of some type operated either by air engines or electric motors.

There are several double-drum hoists in operation, driven by 25-hp. motors, and capable of handling scrapers more than 4 ft. wide at a rope speed of approximately 300 ft. a minute. Such an outfit with two-man crews working on 8-hr. shifts recently mined and scraped into the loading chute more than 1000 tons of ore in one 24-hr. period. For the entire month in which this record was made this one machine was credited with about one-third of the total production from this mine.

Electric Power in Open-Pit Mining

Practically all the open-pit mines have been stripped of their overburden by means of steam shovels and steam locomotives, and a large proportion of the present ore tonnage is handled by the same means. However, a few of the recent stripping jobs have been done partly by electric power, either with electric shovels or drag lines, or by hydraulic sluicing. In practically all cases, however, the haulage is by steam locomotives.

Use of electric power for shovel operation in regular production of ore is becoming more and more general, although it probably will be a long time before the steam shovel will become obsolete on the Mesaba Range. Electric shovels in operation range in size from the small 1¼-yd. revolving shovel up to the 350-ton revolving shovel on trucks, using a 10-yd. dipper. Some of the earlier shovels have a.c. motors, but the latest ones use a synchronous or induction motor-generator set, with d.c. motors and Ward Leonard control.

Fair Dealing Must Be Enforced

Business Standards of Both Fabricators and Mills Must Be Raised to Protect Structural Steel Industry from Ruinous Price Cutting

T. J. FOSTER

"SPECULATION in the steel market is a thing of the past. The structural steel industry has entered an era in which the sole approach to profits is through merchandising," said Thomas J. Foster, chairman National Bridge Works, Long Island City, N. Y., when interviewed by a representative of THE IRON AGE.

"In the days of sharply fluctuating prices, fabricators, as well as other buyers, made speculative purchases of steel when they thought the market was scraping bottom, and frequently cashed in handsomely on their judgment. Such dividends from astute buying have not been possible for several years. Market conditions have changed, and the problem of the fabricator has changed with them.

"It is trite to say that the greatest present need is better selling. What is required is not merely an appreciation of this need, but the development of specific plans for its fulfillment. When it is realized that only a quarter of the structural steel shops in this country showed a profit in 1927, the desperate case of the industry becomes apparent.

"What is wrong? Why do structural shops continue to take business at less than cost?

"Leading fabricators recognize that the problem calls for hard thinking, and, as soon as all those who have a stake in the industry take an unbiased interest in finding a solution, success will not be far around the corner. When new methods are proposed, they are frequently called visionary, but it is only through vision that progress is possible. Murder was formerly regarded as the concern only of the family or clan aggrieved. It took vision to see that murder was a crime against society as a whole, and that punishment was society's obligation.

"It will take vision to see our way out of present economic maladjustments. Already a marked change in the point of view of business men is seen in the growth of trade associations. The interdependence of competitors is winning general recognition. Just as the rise of the state brought new political duties and relationships, so will the new conception of business unity create a new sense of responsibility, which will not merely affect the relations of competitors in a single branch of an industry, but will also control the policy of suppliers of raw materials.

"It is generally admitted that it is demoralizing, damaging and economically wasteful for a fabricator to cut prices below costs. It is not yet so clearly recognized that

"To put business on a higher plane a first essential is to crystallize the best thought regarding proper relationships among competitors on the one hand and between mills and buyers on the other. This conception should be reduced to writing as a code of standard practice. Enforcement, I am confident, will be through individual self-respect and moral suasion."—THOMAS J. FOSTER

it is equally wrong for a mill to sell material to such a price cutter. In fact, it is not uncommon practice for a fabricator who has taken unprofitable work to throw himself on the mercy of the mill, asking it to share part of the loss. That steel producers, at times, have acceded to such appeals from customers is understandable, but, from the standpoint of sound business, such action is inexcusable.

"The steel maker who does not feel responsible for his product

and the merchandising of it after it leaves the mill is short-sighted. A sale of steel to a customer who markets his product at a loss is not merely the affair of the two parties to the transaction, but adversely affects the business of all of the customer's competitors. Instances of this sort when multiplied threaten the very integrity of whole industries. Thus short-sighted sales can seriously impair or even destroy long established outlets for steel.

"An industry cannot flourish when the incompetent are permitted to set the pace for their competitors. It is only because of the lack of an enlightened selling policy that such disturbing elements are allowed to stay in business. The best present-day merchandising provides for the fixing of the retail price by the manufacturer. Granted that such a policy is impractical in the steel industry, there is still room for much more active interest on the part of the mills in the final disposition of their products.

"In the fabricating field, it is not difficult to ascertain when prices are cut to prohibitive levels. Shop methods have become standardized, and there is only a fractional difference in the costs of different shops, whether they be large or relatively small. In fabricating, a shop works to specifications, in contrast with a mass production plant, where operating economies are proportionate to the volume of standard products turned out.

"Selfishness is no bar to more effective cooperation between fabricators and mills. Selfishness will always exist, but it should be our servant, not our master.

"Controlled selfishness is exhibited in the feeding of the family group. Uncontrolled selfishness is exemplified by the hog. The hog eats as though each bucket of swill dumped were the last. Each hog tries to grab the bucket and runs the chance of spilling all of it. The animal is not concerned over the amount it destroys. The quantity it can get and keep others from getting is its whole life.

"Society cannot exist without proper controls; losing them, it lapses into barbarism. Members of society who do

not control themselves voluntarily are controlled by force and we thus have our courts and penal institutions. Business is still in a state of barbarism; it needs civilizing as much as our social life.

"Business must learn that 'success can come only through correct relationships.'

Code of Business Practice Proposed

"To put business on a higher plane a first essential is to crystallize the best thought regarding proper relationships among competitors on the one hand and between mills and buyers on the other. This conception should be reduced to writing as a code of standard practice. Just as the citizen cannot know his duties unless the laws binding him are specific, likewise the business man must have definite information regarding what is expected of him in his economic relations.

"How would the standard code be enforced? Certainly not by Governmental authority. That is neither desirable nor necessary. The salvation of industry lies in solving its own problems rather than in inviting more political interference. Enforcement, I am confident, will be through individual self-respect and moral suasion. Anyone who has observed social life knows that social ostracism is frequently more punishing than conviction at the bar of the court.

"Once a standard of business conduct is generally accepted, violators will be treated as business outcasts. Fabricators, acting on their own individual initiative, but without doubt in sufficient numbers to make themselves felt, will sever all relations with a competitor who indulges in practices that threaten the industry. Nor are they likely to continue to patronize a mill that has so little interest in

their common welfare as to sell steel to such a fabricator.

"What we need is a new conception of integrity and conduct conforming to that conception."

Mr. Foster's proposal for the drafting of a code of standard practice in the selling of structural steel is timely in view of the general appreciation of the need for more stable competitive relationships among manufacturing consumers of steel and, latterly, the growing interest in what mills can do to that end. A number of associations in the iron and steel consuming field have appointed committees on steel mill relations. Mr. Foster is chairman of such a committee for the American Steel and Heavy Hardware Association. A similar committee of the American Institute of Steel Construction is headed by its president, W. M. Wood, of the Mississippi Valley Structural Steel Co., Decatur, Ill.

Cutting Tools Made of Tungsten Carbides

Interest in the cutting or abrasive qualities of tungsten carbides continues and there is every indication that the carbides will be one of the important tungsten products hereafter, in the opinion of Colin G. Fink, writing in "Mineral Industry, 1927." Krupp of Essen, Germany, produces tools of tungsten carbide according to patented specifications by pressing a mixture of tungsten carbide powder together with a little cobalt, nickel, or iron powder as a binder, sintering at 1000 deg. C., shaping, and then finally sintering at about 1500 deg. C. K. Becker and R. Hoelbling have also prepared the carbide W_2C by heating the theoretical amount of tungsten and carbon at 1900 deg. C. in a carbon-free atmosphere. A definite compound results that is very resistant to acids, even mixtures of hydrofluoric and nitric. It can be melted without alteration.

Dubuque Barge Terminal Provides Link for Rail-and-Water Movement from Chicago to Twin Cities

THE new dock terminal at Dubuque, Iowa, shown in the illustration, affords terminal advantages suitable for water-and-rail shipments from the Chicago district to St. Paul and Minneapolis. In the left foreground of the picture may be seen the bulk cargo terminal. Dock house, escalator and wharf barges are shown in the center, and a recently constructed concrete landing for excursion steamers, at the extreme right. In the background are new plants of the Maizwood Products Corporation and the International Harvester Co.

The Interstate Commerce Commission has prescribed rail-and-river rates from practically all points in Illinois and Indiana that produce a large tonnage of traffic for through

movement via Dubuque. The destination territory includes all points on the Mississippi River north of Dubuque and points west of the Twin Cities are far as Grand Forks and Fargo, N. D. The barge-and-rail rate on steel products from Chicago to Minneapolis is $23\frac{1}{2}$ ¢. per 100 lb., as compared with an all-rail rate of $27\frac{1}{2}$ ¢.

The distance from Chicago to Dubuque is 180 miles, a 12-hr. run by rail. The present towboat schedule provides for two trips each way weekly, and the boat time from Dubuque to Minneapolis averages three days upstream and two days downstream. With reasonably close connections between rail service and the towboat schedules, Chicago shippers may expect five-day service by this route.

Qualities of Cold Rolled Shafting

Comparisons with Cold Drawn Steel—Design of Groove for Rolling—Typical Steel Analyses

BY JOSEPH R. MILLER*

IT was Lauth who first made shafting by cold rolling. Setting up a mill with rolls in which he had cut a suitable groove, he accomplished the first of a product which was then and is still superior for the purpose of shafting. With primitive equipment, the fit of the housings and shoes as well as the boxes and windows chipped by hand, and half of an old-time steamboat engine mounted with a heavy flywheel on a big cast iron shaft, this accurate product was made, a standard in its line. And it still deserves to hold its place as a standard for those special purposes to which it was first applied.

Cold Rolling of Steel Shafting. The rough bar is $\frac{1}{16}$ in. above finished size and will not fill the groove, as shown. D is diameter of finished bar; $D + \frac{1}{16}$ is diameter of rough bar; $\frac{1}{2} D$ is radius of groove; $\frac{1}{3} D$ is depth of groove

Perhaps it was a freak of luck that in those early efforts the best of its kind was produced, and upon the foundation of profits from this manufacture, wisely applied, rests the superstructure of a great steel corporation; for in those days line shafting and pulleys and belts carried the power in factories and mills, now carried over the wire. For this service, by the test of years of use, cold rolled shafting established itself in the esteem of those acquainted with it.

The superiority of this product is proved in this way by the most searching test—that of service. The superficial points that were particularly urged in its composition are not hard to find or explain. In the first place it was made to accuracy, and the finish smoothed and burnished with a toughened skin by rolling. In the second place it had a very high elastic limit, which gave it a capacity for heavy loading and reduced considerably the size and cost of the equipment. At the same time it was tough enough to stand considerable bending; as they said at the time, and exhibited specimens, "you could tie it in a knot."

Except for the very excellent surface, all these tests were met in the newer "die rolled" or cold drawn product. But there was something to be learned about these two very similar products, cold rolled and cold drawn. And, as in many phases of our experience, it is the hidden virtue which makes us go finally to the better thing; so it was with cold rolled. The point of superiority preeminent, hard to explain, invisible, is the integrity of its substance or struc-

ture, revealed only in its use or in tests that represent use.

This elemental thing which seemed so hard to explain is lacking in the cold drawn to a more or less extent. The cold drawn bar starts out badly, with an inherent tendency to failure, perhaps from microscopic flaws or possibly an incipient weakness. For the work and strain of the cold finishing process must be passed through the crumbling structure in the pull of drawing, while in the cold rolling process the work is applied direct.

The severity of the comparison between cold drawn and cold rolled steel is modified as the size becomes smaller, so that it is not so evident with bars $1\frac{1}{2}$ in. diameter and less. Also the composition is a factor in the comparison, and the highly satisfactory combination of hardening elements which can be used for good cold rolled shafting cannot be used when the shafting is drawn. Early in the history of the art of drawing the shafting sizes cold it was learned, through expensive and well-nigh disastrous results, that these facts existed. And it was learned also that the speed of drawing had to be modified to suit size and to suit various compositions.

Since line shafting is largely out of style and since, for other similar uses, different makers use their own judgment about the process to be applied, cold rolled steel is not particularly featured by anyone. Hence no one can construe what has been said as favorable to any particular manufacturer. But rather it is to be regretted that there is passing out of hand a superior and remarkable material which should be capable of development, both in its uses and in the cheapening of its production cost.

Below are given some data regarding the corresponding

Typical Compositions of Steel for Cold Working

	Carbon	Manganese	Phosphorus Limit	Sulphur Limit
Cold drawn shafting	0.18 to 0.25	0.40 to 0.60	0.04	0.05
Cold rolled shafting	0.26 to 0.32	0.60 to 0.80	0.04	0.05
Cold rolled axles*	0.26 to 0.32	0.60 to 0.80	0.03	0.05

A silicon content up to 20 per cent is optional.

*For street car and other service, 25 per cent discard.

Diameter of Shaft	Size of Mill
2 in. and under	12 in.
3 in. and under	17 in.
4 in. and under	21 in.
$5\frac{1}{2}$ in. and under	21 in. short rolls

compositions of cold rolled and the cold drawn substitute. There is also given the contour of grooves used successfully for years in cold rolled manufacture and the size of mill for the various diameters. The number of passes to complete a shaft varies with the size and is between 20 and 35, roughly. The speed of the mills described was 60 r.p.m.

Bituminous coal produced in the week ended Sept. 1 was 9,483,000 net tons, according to the Bureau of Mines, bringing the year's total to 312,812,000 tons, compared with 354,315,000 tons to the same date last year.

*245 Melwood Avenue, Pittsburgh.

Crank Shapers Provided with V-Type Ram

V-TYPE ram with 55-deg. V-ways and a newly designed table support features new 16, 20 and 25-in. high-speed back-geared crank shapers which have been placed on the market by the Smith & Mills Co., Cincinnati.

The ram has a cap and gib of one-piece construction for the full length, with single horizontal adjustment to compensate for wear of the bearing surfaces. The ram is of box construction, heavily ribbed and has large bearing on the column ways. Felt inserts connecting with an oiling arrangement have been provided for the ram ways. The ram carrier has been lengthened and screw adjustment provided so that the ram may be positioned while the machine is in motion or at rest. The ram carrier has a large opening in the center so that long shafts may be passed directly through for keyseating, which is emphasized as eliminating the disadvantage of planing at an angle.

In the new arrangement, the housing for the adjustable block of the table support is securely bolted to the base of the machine, and since the support block is always in contact with the table, a bearing is provided even when the table is elevated to its extreme height.

Massive construction of the head is intended to resist tool thrusts from heavy cuts. The head is arranged to swivel through an arc of 90 deg. The screw, of chromium steel, has a bronze adjusting nut for taking up wear and the tool slide is fitted with a full length gib. The slide is adjustable for wear by means of set screws with lock-nuts.

Internal ratchet feed with a drop-

forged pawl and trip is provided. Feed gears are of steel and the solid feed rod is provided with a graduated feed disk which shows at a glance the number of notches, in steps of 0.010 in., up to 15. The feed hanger, of new design, has a long feed stem bearing to permit the connection rod to bear on the outside, thereby eliminating wear in the large hole of the rod. Automatic vertical and horizontal feed of the table in either direction is provided.

The machine is driven by single pulley mounted on tapered roller bearings, through a disk clutch and brake to a six-splined shaft. The clutch and

brake, controlled by a long lever at the side of the operator, start and stop the machine independently of the motor. The speed box is of unit type. Four changes of speed are provided, which, combined with the back gears, give eight cutting speeds. Gears are of alloy steel, heat treated. Shifting gears slide on multiple splined shafts which are mounted on tapered roller bearings. Lubrication of the main revolving shaft bearings and ram ways, as well as of parts inside of the machine, is by means of a one-shot foot-operated system, comprising a supply tank, pump and distributing headers. Motor drive arrangement instead of single pulley drive can be furnished.

Cable Clip with Two Grooved Jaws

CABLE clips having two jaws that are fully grooved for the lay of the cable, so that neither of the cables is gripped by the U-bolt, are being marketed by the Eureka Metal Products Corporation, North East, Pa. Triple grip on the cable is another feature stressed, and it is claimed that the device carries three times the load of a cable clip having only one grooved jaw and a U-bolt in contact with the cable. This clip, available in a full range of sizes in steel and in bronze, is said to give equally good results on wire rope and messenger strand.

Arrangement of the device may be noted from the illustration. There are only four separate parts, the extra grooved jaw being peened to the "U." Any size wrench can be used to tighten the clip and it is stated that

restriction as to the length of wrench handle is unnecessary, because the double grooved surfaces of the clip prevent distortion of the cable regardless of how tightly the nuts are

Triple Grip on the Cable Is a Feature of the Clip

pulled down. In placing the clips on the cable, they may be staggered or placed with all the U-bolts in the same direction. "Circle bends" are not produced in the cable by the clips, and the "U" can be placed over the live cable with as good results as when turned the other way. The double grooved jaws produce a symmetrical loop, with equal flexibility on both sides. It is stated that the stresses on the cable are equalized under heavy loads.

Increased safety and savings in cable, due to the elimination of the cutting of strands by the U-bolts, are claimed. Direct saving in clip cost, as well as saving in labor, are attributed to the fewer clips needed.

Production grinding methods were discussed by Vernon W. Wells, Carborundum Co., Niagara Falls, N. Y., at the first fall meeting of the Cincinnati chapter of the American Society for Steel Treating, Sept. 6.

The Table Support Has Been Redesigned to Provide Rigidity at Extreme Elevation of the Table. The ram has 55-deg. V-ways

Internal Milling Head for Thread Millers

A NEW milling head, for internal milling and hobbing operations, has been made available by the Pratt & Whitney Co., Hartford, for use on its 6 and 10-in. model "B" thread milling machines. Application of this head is emphasized as eliminating the necessity of having two machines,

ing simultaneously of the external and internal heads. Power is transmitted to the cutter of the internal milling head by a gear on the cutter spindle shaft of the external head through two intermediate gears, all gears in this drive being Maag cut. Sight feed oilers provide continuous

The Head for Internal Milling and Hobbing Operations Converts the Thread Miller Into a Universal Unit

one for external work and one for internal work. In addition to this saving, provision has been made for larger output by increasing the cutter speed of the new internal head.

The base of the internal milling head is dovetailed to fit on the cross-slide with the regular external cutter head. The head is locked in position on the cross-slide by a lock bolt equipped with check nuts, which fits into a tapped hole in the base casting of the external cutter head. This arrangement permits the use of the cross-slide handwheel for the travers-

lubrication of the gear train. The spindle of the internal milling head is mounted in bronze bearings and is equipped with a flywheel.

Adjustment is provided for setting the cutter at any angle up to 10 deg. above or below the center line, the angular setting being facilitated by graduations on the side of the milling head. Tie rods serve to hold the cutter arbor at any given angle and to prevent slippage. The angular setting of the cutter above or below the center line is of advantage when milling right or left-hand threads.

Double-Dished Heads for Storage Tanks

MANUFACTURE of steel storage tanks is being materially simplified by the use of double-dished heads, which recently have been developed and put on the market by the Commercial Shearing & Stamping Co.,

diameter, the making of tanks is speeded up by the fact that any number of shells can be cut to size and welded or riveted, with the assurance that the heads will fit accurately. Formerly it was necessary to make each

Upturned Rim Makes the Double-Dished Head

Youngstown, Ohio. In this new head the flange extends in the same direction as the bulge of the head, and flares slightly, so that when the head is pushed into the shell it tightens up around the entire circumference and gives a metal to metal contact—the ideal condition for welding.

Sizes range from 18 in. to 84 in. in diameter. As every head is true to

tank shell to fit the heads, as there was usually so much variation in their circumference that the shell had to be lapped either at one end or the other.

Accuracy of dimension is not the only improvement. Of equal importance is the dished feature, which allows the capacity of the tank to remain unchanged while the length of the shell is decreased from 2 to 4 in.,

depending upon the diameter of the tank. The capacity of the heads in a 30-in. diameter tank is 8 gal. This increases proportionately up to 88 gal. in the 84-in. diameter tank.

Tanks fitted with the double-dished heads, under pressure test, have demonstrated ability to withstand far greater pressures than underwriters' requirements. Double-dished heads are made also in the obtund shape, for basement oil-burner tanks.

Height Gage Attachment for Combination Squares

A NEW height gage attachment for use on the blades of combination squares and sets, making the tools a height gage, has been brought out by the Brown & Sharpe Mfg. Co., Providence. Rigid construction and the arrangement of the blade, which extends practically to the rule, to fa-

Used with Combination Squares and Sets, the Attachment Facilitates Comparative Measurements of Heights or Projections from Plane Surfaces

cilitate relatively exact measurements of heights of blade or projections, are features. The attachment may be used at all positions from the extreme top to the bottom of the blade. It is also reversible and can be used on either side of the blade.

The frame of the attachment is drop-forged and has a japanned finish. The inside end of the pointer, which is of steel, hardened, tempered and ground, projects from the body of the attachment to the edge of the blade so that the height at which the pointer is set may be read easily. Two sizes, designated as the No. 465A and 465B, for use on the company's combination squares and sets having 9-in. blades and on squares and sets having 12, 18 or 24-in. blades, respectively, are available. The attachments are not designed for use on squares and sets having heavy blades.

Day & Zimmermann, Philadelphia consulting engineers, have removed their offices from 1600 Walnut Street to 112 North Broad Street.

Jobbers Object to Lower Cash Discount

Hold Meeting of Protest in Pittsburgh Which Is Attended by Sheet Manufacturers, Who Defend Their Action

JOBBERs of sheet steel made a very urgent plea to sheet manufacturers at a meeting held at the William Penn Hotel, Pittsburgh, Wednesday, Sept. 5, that the latter either rescind their recent action in reducing the cash discount from 2 per cent to one-half of 1 per cent or defer its effective date from Oct. 1 until Nov. 1, to permit the jobbers to discuss the matter at the annual convention of the National Hardware Association at Atlantic City in October.

The Pittsburgh meeting was called by F. O. Schoedinger, Columbus, Ohio, chairman metal branch National Hardware Association, and represented another step on the part of the jobbers to stem the lowering of the cash discount terms, originally announced by the American Rolling Mill Co., Middletown, Ohio, and since adopted by all manufacturers of sheets. It followed a recent visit of a delegation of the sheet jobbers to the American Rolling Mill Co. at Middletown on a like mission. Because the reduced discount is to become effective Oct. 1, and that date is prior to the metal branch annual convention, it was felt to be highly important that the position of the jobbers be laid before manufacturers promptly.

Jobbers Adopt Resolution of Protest

About 30 members of the metal branch from various parts of the Eastern half of the United States met in executive session during the morning at which the matter of the reduced discount was thoroughly threshed out and resulted in the following report of a special committee:

"Your committee wishes to present as a result of the deliberations of a special meeting held in Pittsburgh, the following resolution, which was originally adopted in 1899, when a similar movement to lower the cash discount was proposed:

"That it is the sense of the National Hardware Association that the discount, 2 per cent for cash in 10 days, formerly given by manufacturers of steel and iron goods, be not construed as bank interest, but as a premium for prompt payment and as an insurance or protection of credits, and further, that such or similar discount be retained where still allowed, and that we urge its restoration where it has been discontinued."

"The reasons for this are as follows:

"The cash discount is an insurance or protection of credit for the reason that it permits the extension of credit on a 10-day basis to those who are only entitled to credit for this period and no longer.

"If the 2 per cent is withdrawn, it will tend to increase accounts receivable of mills and jobbers to a figure that would, in many cases, necessitate refinancing and considerable capital.

"The 2 per cent discount should not

be regarded in light of bank interest, but as a premium for prompt payment or a penalty for failure to make payment within the 10-day period.

"The 2 per cent discount should be and is generally regarded as a legitimate item of cost, just as raw material, labor, freight, etc., and should be always added as such by all mills and manufacturers.

"The reduction of the cash discount would reduce net profits of jobbers, which now are approaching the vanishing point; this can be definitely proved from reports compiled by our association.

"The reduction of the cash discount by sheet steel mills would set an example for similar action by other groups of manufacturers.

"It would not be possible for jobbers of sheet steel, hardware and kindred lines to reduce their cash discount to one-half of 1 per cent to their trade for the reasons given in articles one and two and also because of the diversity of the lines distributed by them and the competitive conditions among the hundreds of distributors handling sheet steel whose territories overlap.

"We understand that the chief contention of the mills in proposing the reduction of the 2 per cent discount is because they claim that it is costing them 36 per cent. We wish to refute this statement and point out the fact that the only cost to them is the interest rate that they are compelled to pay on their accounts receivable, which is offset by the penalty of 2 per cent collected from those who do not discount.

"The jobbers can only figure 2 per cent on the number of turnovers of their stock, which average four times per annum, or 8 per cent on the amount invested in stock. The one-half of 1 per cent discount, if put into effect, will show jobbers' a loss of 6 per cent.

"The reduction of the cash discount will not only greatly increase the accounts receivable, but will add to the cost of collection, which will affect both mills and jobbers."

Manufacturers Defend Their Action

This report, which was signed by R. H. Lyon, Lyon, Conklin & Co., Baltimore; A. W. Howe, L. A. Osborne Co., Cleveland; Walter B. Richards, Richards & Conover Hardware Co., Kansas City, and W. H. Donlevy, Carter, Donlevy & Co., Philadelphia, formed the basis of the discussion of the afternoon meeting, at which the representatives of several of the sheet steel companies were present.

As his company inaugurated the lower discount, it fell to the lot of Charles R. Hook, vice-president American Rolling Mill Co., to explain the reasons which led his company to take the step. He said that every possible

angle of the matter had been considered prior to the announcement and that among the phases that had been debated was the desirability of encouraging prompt payment of bills. But there was also the fact, Mr. Hook pointed out, that it was much easier for jobbers to finance themselves, in view of the easier money and credit situation that now exists, as compared with the time when the discount was set at 2 per cent. He also drew attention to the inconsistency of his company in allowing one-half of 1 per cent discount on steel loaded in one end of a car and 2 per cent on material in another part of the same car, when both products came from the same mill. In answer to a question, Mr. Hook said that 6 per cent of his company's product passed into consumption through jobbing channels. He further justified the lower discount rate by observing that jobbers could borrow money at 6 per cent and actually net 9 per cent and that the manufacturers received no discount on raw materials and that in some cases, notably on spelter purchases, payment was made before the goods were received.

Sheet Manufacturers' Problems Stressed

John Follansbee, president Follansbee Brothers Co., Pittsburgh, also spoke and was able to present both the manufacturing and jobbing viewpoint, since his company manufactures sheets and through a subsidiary does a jobbing business. Mr. Follansbee said his company would allow one-half of 1 per cent for cash on carloads and 2 per cent for the smaller or warehouse lots. He said that on warehouse lots the price is \$20 a ton over the mill base and that it was necessary to allow a high discount on such lots to insure prompt payment. Fred M. Fuller, assistant general manager of sales American Sheet & Tin Plate Co., Pittsburgh; John J. Watson, general manager of sales Weirton Steel Co., Weirton, W. Va.; W. S. Horner, vice-president American Rolling Mill Co.; W. W. Latta, sales manager sheet steel division Wheeling Steel Corporation, and L. D. Mercer, general manager of sales Berger division, Central Alloy Steel Corporation, Canton, Ohio, also presented the views of the manufacturers. The latter pointed out that the sheet manufacturers have as many troubles in sales as do the jobbers and made a strong plea for cooperation in the solution of the problems of distribution. The Newport Rolling Mills Co., Newport, Ky., was represented by F. A. Moeschl, and the Apollo Steel Co. by A. M. Oppenheimer, president.

Those discussing the matter from the jobbers' angle laid much emphasis upon the desirability of the manufacturers' including the discount as part of the cost and to employ this method as a means of retaining the 2 per cent discount. This suggestion was met by manufacturers by one that the jobbers raise their sales prices to the extent of the reduction in the discount.

Ingot Production Made a New Record for August, While the Eight-Month Total Was 4 Per Cent Ahead of Any Previous Eight Months. Prices were only fractionally better in August than in July

Largest August Steel Ingot Production

Output Exceeds by 100,000 Tons Any Other Month in Second Half of Any Year—Eight-Month Figure a Record

PRODUCTION in August of open-hearth and Bessemer steel ingots in the United States, as indicated by reports made to the American Iron and Steel Institute, was 9.6 per cent greater than in July. The August gain last year was in about the same ratio. The August production, at 4,178,481 tons (calculated) was not only the largest August tonnage ever recorded, but was larger than the production of any other month in the second half of any year. Only two previous months later than May have shown more than 4,000,000 tons—October, 1926, with 4,074,544 tons, and October, 1918, with 4,017,435 tons.

On the basis of 27 working days, with which August is credited, the output was 154,759 tons a day. This is the highest figure since May and compares with 129,576 a year ago. Output in July was given as 152,463 tons a day.

For the eight months of the year to date, the calculated production was 32,782,937 tons. This is 7.4 per cent greater than the 30,510,071 tons of last year and 3.2 per cent greater than the highest previous record for the first eight months, which was that

of 1926, with 31,775,768 tons. Previous to 1923 no year had shown as much as 30,000,000 tons in the first eight months. Beginning with that year, however, only 1924 and 1925 have fallen below that figure.

Total ingot production, including crucible and electric steel ingots, which no longer are reported by the institute, was probably 1000 tons greater on the daily basis than the figure given. Production of crucible

and electric ingots in 1927 aggregated 378,974 tons in the 12 months. This production is irregular, being much heavier in the spring customarily than in the later months of the year. Probably 275,000 tons under this heading was produced in the first eight months. This would raise the total ingot production to more than 33,000,000 tons, or 4 per cent greater than the highest record, which included electric and crucible ingots.

Lowest Locomotive Shipments in Over 15 Years

WASHINGTON, Sept. 11.—Thirty-four railroad locomotives were shipped in August, as against 46 in July and 81 in August of last year, according to reports received by the Department of Commerce. August shipments were the lowest for any month in more than 15 years. For the eight months ended with August 394 locomotives were shipped, compared with 711 for the corresponding period of last year and 1157 in 1926.

Of the August shipments, 23 steam and four electric locomotives were for

domestic account, while seven steam locomotives were for foreign account. Unfilled orders at the end of August totaled 204 locomotives, of which 135 steam and 26 electric locomotives were for domestic use and 41 steam and two electric locomotives were for export.

While the decline from last year has hit all types of locomotives, it is noteworthy that shipments of electric units for domestic use have held up far better than the three other groups. Here the reduction for the eight months was from 109 to 85, or 22 per cent. In steam locomotives for domestic use the drop was from 487 to 257, or 47 per cent; in locomotives for export, from 115 to 52, or 55 per cent.

Inspect River-Rail Terminals

Pittsburgh District Steel Companies Well Represented in Boat Trip on Monongahela River

ALMOST all of the steel companies in the Greater Pittsburgh district were represented in the river-and-rail terminal inspection trip held Thursday, Sept. 6, under the auspices of the shippers' council, Chamber of Commerce of Pittsburgh. Leaving Pittsburgh on the steamboat Julia Belle Swain, the party, which numbered more than 300, was conveyed up the Monongahela River to Clairton, Pa., the site of the steel works and by-product coke plant of the Carnegie Steel Co. The coke works at this point comprises 1482 ovens and is the largest plant of this kind in the world. In full operation it carbonizes 30,500 tons of coal a day, producing approximately 22,000 tons of metallurgical coke, supplying all of the blast furnace requirements not only of the Carnegie Steel Co. stacks in the Pittsburgh district, but most of the other ore smelting units of the Steel Corporation in that area. A tow of several barges of coke moving from the Clairton ovens to the Mingo, Ohio, blast furnaces of the Carnegie Steel Co. was met on the up-river trip.

Another steel plant passed on the first leg of the journey was that of the Jones & Laughlin Steel Corporation, located on both banks of the Monongahela River. Much interest was shown in the facilities this company has created for the inward movement of raw materials and the outbound movement of finished products. The dockage employed in connection with car ferry service between the company's Pittsburgh and Aliquippa, Pa., works, commanded particular attention. At West Homestead, the plant of the Mesta Machine Co. and the boat ways and docks of the John Eichleay, Jr., Co. were passed. Then came the works of the Carnegie Steel Co. at Homestead, on the south bank of the river, and the Carrie furnaces, seven in number, which serve the Homestead plant with molten pig iron, on the opposite bank. Next were passed the Rankin and, Braddock plants of the American Steel & Wire Co. on the north bank of the river and, just beyond, the Edgar Thomson works of the Carnegie Steel Co.

At McKeesport, the plant of the National Tube Co. came into the picture, while at Dravosburg, a few miles further, were the Carnegie Steel Co. marine ways and storage landing and crane, where much of the steel sent south by water, by that company is assembled. At Glassport is located the freight assembling station of the American Barge Line, one of the commercial barge lines serving Pittsburgh district companies on river-borne shipments to points along the Ohio and Mississippi rivers. The turn was made at Clairton, and the party was taken back over the Monongahela to the Ohio River as far as Neville

Island, where the Dravo Contracting Co. launched two river barges while the tourist steamer was passing. It had been intended to journey up the Allegheny River as far as Aspinwall, but a late start made it necessary to omit that portion of the trip.

Traffic officials of the Bethlehem Steel Co. were particularly interested members of the party. This company

New Commerce Office

Department of Commerce Establishes Pittsburgh Headquarters

A NEW branch office of the Department of Commerce was opened in Pittsburgh on Sept. 8 in the Chamber of Commerce Building. The office is in charge of Wilson K. Ray, who has been assistant chief of the Iron and Steel Division of the Department since May, 1927. Formal ceremonies for the opening will take place in Pittsburgh on Oct. 5 with prominent Government officials participating. The Department has also recently established branches at Milwaukee, Charlotte, N. C., Indianapolis and Denver.

Mr. Ray is a native of Pittsburgh and formerly was connected with the Liberty Steel Products Co. and Lawry-Ray Co., steel broker, of that city, having been a member of the latter firm. Born in 1893, he attended the public schools of Pittsburgh, Shady-side Academy and Princeton University, receiving the A. B. degree from Princeton in 1915. From 1915 to 1917 Mr. Ray was engaged in the general insurance business in Pittsburgh and from 1917 to 1919 served with the American Expeditionary Forces in France. After he was discharged from the army he returned to Pittsburgh and engaged in the sale of iron and steel products and railroad and construction supplies.

In August, 1923, Mr. Ray was appointed assistant trade commissioner and assigned to the Paris office, and on Dec. 1, 1925, he was appointed as special agent in the Industrial Machinery Division of the Department at Washington. Subsequently he was made chief of the hardware section of the Iron and Steel Division and later assistant chief of the division.

Varied Service Offered

The opening of the Pittsburgh office, said Director Julius Klein of the Bureau of Foreign and Domestic Commerce, marks another step in the Department's program of establishing "service stations" in various parts of the country where information and counsel on all subjects pertaining to foreign and domestic trade may be promptly furnished. Dr. Klein emphasized the excellent service which has

already has tried the experiment of shipping steel from its Cambria works, Johnstown, Pa., by rail to Glassport for river shipment to Southern and Southwestern destinations, and it is understood that the company is interested in a movement looking toward the improvement of the Connemaugh River from a point near Johnstown to its junction with the Kiskiminetas River. As the latter empties into the Allegheny River near Freeport, Pa., the Connemaugh River improvement would place the company in a position to use the inland waterways in moving steel from Johnstown.

been given by the Pittsburgh Chamber of Commerce. It has acted as a co-operative office of the Department since May 19, 1919, and the new office has been made possible largely through its efforts. Because of the importance of the Pittsburgh district in the iron and steel, machinery, foundry, coal and allied fields, the office will be of especial value to those trades. The district which the new office will cover includes western Pennsylvania, eastern Ohio and West Virginia.

In addition to the aid offered to exporters, the Pittsburgh office will serve as a clearing house for firms in its district for information on a great many problems connected with domestic marketing. The Bureau of Foreign and Domestic Commerce is making studies in domestic commerce as part of its nation-wide elimination of waste program. The purpose of these investigations is to acquire and disseminate exact data concerning domestic commerce and the best marketing practices. The resulting information will be made available promptly through the Pittsburgh office, which will also cooperate in arranging for special investigations desired to serve the particular needs of the area covered.

Together with the general economic information on every world market, the Pittsburgh office will be able to provide the latest available information on such subjects as foreign tariffs, trade practices and commercial laws; foreign banking, currency, and exchange; methods of packing for different markets; most economical shipping routes; warehouse facilities in foreign ports, etc. It will also furnish exporters confidential information regarding trade opportunities abroad and provide them with reliable data in connection with distributors and agents in foreign countries.

Announcement is made that the concession department of the Government of Soviet Russia has placed the tungsten deposits of the Transbaikalian region of Siberia on the list of resources open to exploitation by foreign firms. Large reserves, which have been worked to a very slight extent for a number of years, are indicated by preliminary explorations.

Welsh and American Mills Negotiating

Agreement on Tin Plate Export Markets Reported Imminent—
German Freight Increase Raises Mill Costs — European Prices Firm

(By Cable)

LONDON, ENGLAND, Sept. 10.

THE position of Cleveland furnaces is improving with consumers covering their autumn requirements and foreign competition negligible. Hematite demand is expanding slowly, but output is still restricted and prices are steadier. Pease & Partners are permanently closing the Tees Bridge Iron Works. Foreign ore is quiet.

Export demand for finished steel is increasing. Japan has been a buyer of shipbuilding material and Australia and New Zealand are among the foreign markets inquiring. Domestic demand for construction work is heavy and likely to continue active for several months. Dorman, Long & Co. have secured an order for 47,000 tons of rails for South Africa.

Galvanized sheets are active and makers are well sold for several weeks ahead. Some Japanese demand is reported for black sheets, but the tonnages involved are mostly small.

Continental markets are firm with some good business being booked direct from overseas. Demand from British consumers is restricted as the

price difference between Continental and British mill prices has narrowed considerably.

The International Wire Rod Cartel meets Sept. 11, when the question of entry of Austrian, Hungarian and Czechoslovakian mills is to be discussed.

Welsh tin plate bars are in active demand, as Continental steel is now expensive for British users. Tin plate demand is good for October and later delivery, but September specifications are needed by most mills although they are well sold for October-December shipment and some into next year.

Arrangements are reported imminent between United States and Welsh tin plate makers for the regulation of sales in certain large export markets. Following negotiations here, Welsh representatives are now visiting the United States and agreement may be reached on lines, the indicated result of which is expected to be that Welsh mills while relinquishing certain markets will no longer encounter United States competition in others and should benefit considerably in the total volume of their export trade.

maintain their equipment properly by necessary purchases of rolling stock and at the same time to accumulate required reserves of cash in the bank. It is of great importance also to the iron, steel and coal industries.

In 1927, a sum equal to only 3.6 per cent of the Railroad Corporation's fixed capital was provided to write off obligations. In 1928, had the present rates been maintained throughout the year, there would have been a deficit, after payment of 660,000,000 m. (\$157,212,000) contribution to reparations, of 489,000,000 m. (\$116,479,800). Increased costs of operation are based on higher salaries and wages, which total 2,470,000,000 m. (\$588,354,000), while expenditures for materials have been only 1,258,000,000 m. (\$299,655,600), compared with 1,388,000,000 m. (\$330,621,600) in 1927.

In May the Government refused consent to an increase in rates by which 250,000,000 m. (\$59,550,000) of additional revenue would be obtained, 195,000,000 m. (\$46,449,000) from freight charges and 55,000,000 m. (\$13,101,000) from passenger fares. Industry objected and the question was submitted to the Federal Railroads Court, which has decided for an advance, of which freight is to bear 200,000,000 m. (\$47,640,000) and passenger fares 50,000,000 m. (\$11,910,000). As coal carrying alone provides about 30 per cent of the Railroad Corporation's gross receipts, coal will be considerably affected by the increased

German Freight Increase Approved

Railroads Allowed 11 Per Cent Advance, Probably on Oct. 1—Export Prices Continue Strong

BERLIN, GERMANY, Aug. 29.—Railroad freight rates are to be advanced an average of 11 per cent, probably

about Oct. 1. The increase is expected to offset the deficit of the railroads, which have found it impossible to

(a) Nominal.

rates. The steel industry will also be affected, and mills claim that their export surplus, which has been increasing this year, may again decline. The delivered prices of steel to finishing mills, and freight rates on exports will necessarily increase.

Iron and steel output is still declining, but the general situation is not so unfavorable as a month ago. Improvement comes from the firmer prices in the export market. Rolling mill production in July was 1,026,333 metric tons, compared with 1,052,905 tons in July, 1927. Total output for the first seven months of this year was 7,294,699 tons, compared with 7,344,936 tons in the corresponding period of 1927.

Domestic activity has declined only slightly in the past few weeks. The Stahlwerksverband has booked an order from the Railroads Corporation for 550,000 tons of rails and ties for delivery during the next year, and a further purchase of 100,000 tons is expected. "Avi," the association of producers which determines the amount of price rebates by the Ingot Steel Syndicate to exporting manufactur-

ers, reports that large export orders for machinery and other metal products are being booked.

Semi-finished material prices in the domestic market have shown some weakness lately, but export quotations are firm. Structural steel has been more active for domestic delivery, but the building trades have been less active this year than had been expected. Business in steel bars is good, but most of the tonnage being rolled consists of specifications against large contracts placed in the spring when an advance in the market was expected. Some mills are asking 10 to 12 weeks' delivery on bars. Sheet mills rolling the heavier gages for export are well filled with orders, but the average of deliveries is now three weeks. Orders for light-gage sheets are unsatisfactory and prices are being shaded. No change has been made in price rebates to exporting manufacturers. The result of price firmness in France and Belgium has been to reduce the difference between German domestic prices and the "world market" level, on which rebates are based.

ed for 93 per cent of the 1927 output.

The figures show clearly that the Swedish iron ore industry is in process of rapid development, although the condition of the iron and low-grade steel industry is far from good. During 1927 only 58 of the 125 blast furnaces in Sweden were in operation, and the production of pig iron decreased to 417,765 tons from 462,200 tons in 1926, in spite of a considerable increase in exports. Only foundry pig iron has shown an increase in production, and this was due chiefly to the utilization of the large blast furnaces at Oxelosund. The decrease in pig iron production as a whole is held to have resulted from a deliberate attempt on the part of producers to decrease reserve stocks, which have been too large.

Production of steel and rolling mill products was about the same as in 1926, though certain electric steel products, such as rails, showed an increase over 1926. The prices of iron and merchant steel dropped as the result of keen competition from Continental producers. Production of iron alloys increased to 36,750 tons from 32,508 tons in 1926.

British Steel Export Trade Small

Foreign Orders for Pig Iron and Tin Plate, However, Are Large—
"Protection" Still Urged

LONDON, ENGLAND, Aug. 31.—Conditions in the iron and steel trade have not altered much in the past fortnight, as in most districts holiday periods have obstructed the flow of normal trade. Vacations, however, have about ended and fall activity is expected before long.

Pig iron producers have reduced their prices to the lowest level permitted by costs. Stocks of iron are small, and buyers are beginning to contract with domestic producers rather than on the Continent. A favorable factor is the steady increase in the cost of foreign material, which, in the case of pig iron, has advanced so that the Continental furnaces are no longer competitive here. For export, however, foreign competition is still keen as European furnaces endeavor to regain their foreign markets.

It is expected that, with Parliament once more in session, advocates of "protection" on iron and steel will again become active. But not much progress is expected in view of the pronouncement of Premier Baldwin that the Government cannot accede to requests for protection. It is evident, however, that one of the foremost issues of the general election in 1929 will be an extended program of protection.

Business in finished products has suffered from the holiday period, and there is as yet little improvement, although in some branches, particularly structural steel and certain light materials, there has been considerable activity in the domestic market.

Tin plate mills have been booking some good orders and, in most cases,

are well filled for several months. The latest advance of the minimum price to 18s. (\$4.37) per base box, f.o.b. works port, has apparently convinced consumers that lower prices are no longer in prospect, and heavy buying from all foreign markets has developed.

Swedish Exports of Iron Ore Exceed Output

Production of iron ore in Sweden during 1927 reached the record figure of 9,660,977 metric tons, an increase of 14 per cent over the 1926 total of 8,465,914 tons, and of 29.2 per cent over the 1913 total of 7,475,571 tons, according to a report received by the Department of Commerce from Basil D. Dahl, assistant trade commissioner, Stockholm. This increase is attributed to the sale of the ore in foreign countries, since the domestic consumption is considerably less than before the war. The exports of iron ore last year reached a new high figure of 10,700,000 tons. Trafik Aktb. Grangesberg-Oxelösund, the leading exporter of iron ore, extracted 7,650,000 tons in 1927 and exported 9,790,000 tons, the difference being made up by drawing upon the reserve stocks at Narvik. In 1927 the Grangesberg company purchased that part of the Grangesberg field belonging to Stora Kopparbergs Bergelags Aktb., and thus strengthened its already strong position in the Swedish iron ore industry. The provinces of Norrbotten and Kopparberg account-

German Wire Rod Mills Adopt Export Contract

HAMBURG, GERMANY, Aug. 26.—To prevent the resale to German consumers of wire rods bought by Dutch and British merchants from German mills at export prices f.o.b. Hamburg or Antwerp, the mills here have adopted a new contract form. In the future all purchasers for export must agree in the contract not to resell the rods into Germany and to submit actual proof that the material has been shipped to another country. Breach of this contract is penalized by a fine of 50s. (\$12) per ton. It is understood that no sales for export are being made unless the new contract is accepted by the buyer.

Wire rod producers expect this to prevent a practice which has been increasing and exercising a depressing effect on the wire rod market in Germany. The difference between the domestic and export price of wire rods has been rather wide, with exports at £6 (\$29.16) per ton f.o.b. Antwerp or Hamburg, and the domestic market at about 159 m. (\$38) per ton delivered.

The second International Conference on Bituminous Coal is to be held in Pittsburgh, Nov. 19 to 24, under the auspices of the Carnegie Institute of Technology. About 100 engineers and scientists, representing 15 nations, have tentatively accepted invitations to speak or send papers.

An American syndicate is to construct a pipe line at Baicoi in the Rumanian petroleum region, according to *L'Usine* of Paris. The line, which is to be known as the Constantza, is to be purchased in six months at a cost of about \$3,000,000.

Importers Await Steel Marking Test

Suit Before Customs Court with Government Defending Its Ruling
Is Expected—Far Eastern Trade Small

NEW YORK, Sept. 11.—The United States Treasury Department's investigation of the marking of foreign steel with the country of origin is still being widely discussed by importers, who would be affected by a ruling requiring more marking than at present. With few exceptions almost all importers in New York and Philadelphia have received notices that their arrivals are being investigated at the request of certain domestic steel producers. A test case against one importer of steel is expected to result from the present investigation.

Except for a small tonnage of steel that is still arriving on orders placed with European mills by importers when the market abroad was lower, there is but little business. Continental export prices have been again advanced, so that beams are quoted at about 1.82c. per lb., duty paid, New York; channels, angles and tees at about 1.87c. per lb., New York, and plain steel bars at about 1.95c. per lb., New York. Recently Southern makers of hoops and bands have been able to meet the delivered prices of importers, so that sizable arrivals of Continental material seem to have been temporarily checked. Recent quotations on hoops have ranged from 2.30c. to 2.50c. per lb., duty paid at

Southern port, the price depending upon the gages specified.

Export trade with the Far East continues small, despite the Chinese boycott of Japanese products, which was expected in some quarters to bring a few small orders for tin plate and sheets to the United States. While Japanese trade with China has apparently been somewhat affected by the boycott, Japanese galvanizing plants, particularly, being reported as feeling the effect of the curtailment of buying by China, exports of Japan in August were valued in excess of imports, the exports having been 189,000,000 yen (\$86,694,300) and the imports 152,000,000 yen (\$69,722,400). The exchange value of the yen, however, continues low.

Some of the recent lack of Japanese buying, particularly the scarcity of black sheet business, is attributed to unusually heavy rains in Japan during the summer. Under normal weather conditions, the rice growers require a fair tonnage of sheets for use in holding water on the rice fields, but continued heavy rains have made this unnecessary. At the same time, it is pointed out that continued rain has reduced the volume of small building construction, thereby reducing the demand for sheets for roofing.

in operation, was 1,034,694 tons, against 1,021,350 tons produced from 103 furnaces in June. The daily average per furnace was 333¾ tons in July and 330½ tons in June. Steel output in July totaled 1,311,134 tons, compared with 1,294,538 tons in June.

Gains in exports in July were made in 10 classes of products, and losses were registered in 11 classes. While most of the changes in individual products were small, there were several instances in which large tonnages were added. The chief of these was an increase of 9197 tons in plates and sheets, with a total of 39,266 tons in July, against 30,069 tons in June. Exports of bars and rods made a gain of 6562 tons, amounting to 99,415 tons, against 92,853 tons. Exports of wrought pipe gained 6468 tons, totaling 36,568 tons, compared with 30,100 tons, while pig iron exports, amounting to 23,551 tons, showed an increase of 2923 tons over the 20,628 tons exported in June. Ingots, blooms and billets declined 5476 tons to 49,681 tons, against 55,159 tons. A decline of 4531 tons was made in exports of rails, which amounted to 50,928 tons, compared with 55,259 tons. Hoops and bands made a decline of 3046 tons to 12,195 tons, compared with 15,241 tons.

The largest items of importation in July consisted of iron and steel bars, rods and angles, which amounted to 55,650 tons, against 59,849 tons in June. Imports of pig iron and ferroalloys aggregated 29,964 tons, against 31,422 tons, while imports of ingots, blooms and billets amounted to 26,936 tons, compared with 24,366 tons.

German Exports Up; French Declining

Shipments of Iron and Steel Products from Each Country
Running About 400,000 Tons a Month

CONTINUING the upward trend of the preceding month, exports of iron and steel products from Germany in July aggregated 407,528 metric tons, against 353,815 tons in June, a gain of 12,004 tons, according to a radiogram received by the Department of Commerce from Fay-

ette W. Allport, commercial attaché, Berlin. Imports maintained practically the same level, amounting to 163,417 tons in July, compared with 163,394 tons in June, a difference of but 23 tons.

Production of pig iron in Germany in July, from the 100 blast furnaces

French Exports Less Than
in 1927

EXPORTS of iron and steel products from France during the first half of 1928 totaled 2,286,600 metric tons, against 2,625,160 tons for the corresponding period of last year, a decrease of 338,560 tons, according to preliminary figures received by the Department of Commerce from Paris.

German Foreign Trade in Iron and Steel in June and July, 1928
(In Metric Tons)

	Exports		Imports	
	June	July	June	July
Pig iron and ferroalloys..	20,628	23,551	31,422	29,964

French Foreign Trade in Iron and Steel—First Six Months
(In Metric Tons)

	Exports		Imports	
	1928	1927	1928	1927
Pig iron	300,000	448,000	21,000	17,000
Ferroalloys	4,000	2,000	12,400	16,800
Blooms, billets and bars.	1,281,000	1,459,000	6,800	9,000
Ingots	26,000	24,000		
Rails	187,000	197,000	2,500	846
Sheets of all kinds, including hot-rolled bands	137,000	141,000	2,400	6,000
Hoop iron or steel, hot-rolled and cold-rolled	59,000	43,000	1,900	1,100
Machine iron or steel...	122,000	97,000		
Wire	31,800	28,460	1,400	1,700
Wire nails	4,800	7,700	30	12
Cast iron work.....	134,000	178,000		
Total	2,286,600	2,625,160	48,430	52,458
Average month...	381,100	437,527	8,072	8,743

The figures include the Saar in each case.

Imports were 48,430 tons and 52,458 tons respectively, a decrease of 4028 tons.

Exports of pig iron showed a decrease of 148,000 tons, amounting to 300,000 tons, against 448,000 tons, but pig iron production during the first six months of the present year was 300,000 tons greater than during the corresponding period of last year. Imports of pig iron, amounting to 21,000 tons, showed an increase of 4000 tons over the 17,000 tons imported during the first half of 1927. This situation is explained by both the increased French production of steel, which absorbed a large part of the pig iron output, and by export difficulties, especially in England, following price reductions by the British producers.

French exports of blooms, billets and bars also showed a decline, amounting to 1,281,000 tons, against 1,459,000 tons. As French production of steel during the first half of 1928 reached 4,624,000 tons, an increase of more than 500,000 tons over that of the two preceding years, the diminution in exports can be explained only by an appreciable increase in the national consumption. This is, therefore, an indication that the French mechanical and fabricating industries were able to increase their manufacturing operations.

German Steel Houses to Be Made in Czechoslovakia

HAMBURG, GERMANY, Aug. 25.—The Vereinigte Stahlwerke A. G., Düsseldorf, has licensed a newly formed company in Czechoslovakia, Stahlhaus A. G. at Bratislava, to manufacture its steel dwellings. The buildings are to be made for the new company by the Mannesmann Tube Co. of Czechoslovakia, and it is planned to produce 3000 next year. A new company has also been formed in Vienna to produce steel dwellings for construction in Austria, and 2000 houses is the output planned for 1929.

New Export Terms on Machinery Formulated

HAMBURG, GERMANY, Aug. 26.—Machinery makers are expected to agree upon new conditions for export payments. At present the usual conditions on export sales are one-third of the total price with the order, one-third on delivery and one-third against bill of lading.

The suggested conditions are that European countries should pay one-third when an order is ready to ship, one-third against bill of lading and one-third on a sight draft at point of delivery. Conditions to overseas buyers under the proposed revision would be one-half against bill of lading and the balance against a sight draft.

These terms would be applied only to ordinary standard machinery. If special designs are purchased, the usual payment of a deposit would be

required, either in cash or by opening a letter of credit. The suggested revision of terms may be adopted by machinery makers in Czechoslovakia and Austria.

Czechoslovakian Mill Opens Moscow Sales Office

HAMBURG, GERMANY, Aug. 26.—The Skoda Steel Works, Pilsen, Czechoslovakia, is reported to have been granted permission by the Russian Government to establish a sales office in Moscow. This has caused considerable comment, as it is the first case of a foreign manufacturer being permitted to deal directly in Russia, instead of through the Government trading companies. The Skoda works produces alloy steels, special quality sheets, machinery, guns and rifles.

German Reparations Deliveries Large

HAMBURG, GERMANY, Aug. 26.—Shipments of steel and machinery on reparations account were higher in July than in any month since establishment of the Dawes plan, totaling 7,200,000 m. Near Eastern countries, France and Portugal received the heaviest shipments, but Japan also bought machinery valued at 300,000 m., which was charged to reparations, the first such purchase by that country.

British Institute to Hold Fall Meeting in Spain

The autumn meeting of the Iron and Steel Institute (British) will be held at Bilbao, Spain, Sept. 25 and 26. The following technical program is announced:

"Iron Ore Mining in Vizcaya," by J. Balzola.

"The Influence of Varying Strains and Annealing Temperatures on the Growth of Ferrite Crystals in Mild Steel," by C. A. Edwards and T. Yokoyama.

"The Phenomena of Corrosion of Iron and Steel," by A. Herrero and M. de Zubiria.

"The Influence of Pearlization below the Ar₁ Point on the Mechanical Properties of Carbon Steel," by J. Orland.

"The Use and Interpretation of the Transverse Test for Cast Iron," by J. G. Pearce.

"The Change in Tensile Strength due to Aging of Cold-Drawn Iron and Steel," by L. B. Pfeil.

"Some Properties of Cold-Drawn and of Heat-Treated Steel Wire," by S. H. Rees.

"Effects Observed in Quenched Liquid Steel Pellets and Their Bearing on Bath Conditions," by J. H. Whiteley.

The sessions will be held in the assembly hall of the Alfonso XIII High School.

Pig Casting Machine for India

The Bengal Iron & Steel Co., Barrackar (Kulti), India, has bought from Heyl & Patterson, Inc., Pittsburgh, a double strand pig iron casting machine, a ladle cradle, three ladles and an 80-ton crane. The order for the crane has been let to the Moragan Engineering Co., Alliance, Ohio.

German Cruiser Is to Be Electrically Welded

HAMBURG, GERMANY, Aug. 26.—It is reported that the new German cruiser, to be constructed at the Deutsche Werke, Kiel, is to be electrically welded, no rivets being used in any part of the ship. It is also understood that the armor plate used will be thinner than the usual battleship plate, made of a new alloy steel developed by Friedrich Krupp A. G. This steel will have the same resistance as the steel formerly used and will reduce the weight about 22 per cent, which is expected to permit greater speed.

Delegates Chosen for London Fuel Conference

Seven of the ten official delegates who will represent the United States at the Fuel Conference to be held in London from Sept. 24 to Oct. 6, under the auspices of the World Power Conference, have been chosen, as follows: Dr. Gustav Egloff, petroleum technologist, Universal Oil Products Co., Chicago; H. W. Brooks, consulting engineer, New York; O. P. Hood, chief of the technological branch, United States Bureau of Mines, Washington; Martin Frisch, manager of field engineering, Combustion Engineering Corporation, New York; G. A. Orrok, consulting engineer, New York; David B. Rushmore, formerly consulting engineer, General Electric Co., New York, and O. C. Merrill, general chairman of the American Committee of the World Power Conference and ex-secretary of the Federal Power Commission.

German Rail Rates Reduced on Czechoslovakian Exports

HAMBURG, GERMANY, Aug. 26.—An agreement has been negotiated between the German Railroad Corporation and the Czechoslovakian railroads associated with the Czechoslovakian Government, under which freight rate concessions are made by both railroad systems on transportation of Czechoslovakian steel, non-ferrous metal products, machinery and locomotives, when such materials are exported to overseas countries via Lübeck, Hamburg or Bremen, Germany. In the past, Czechoslovakian mills have been greatly handicapped by the high German freight rates, but under the new agreement they receive the same treatment as is accorded to German exporters of the materials specified. It is expected that the new arrangement will place Czechoslovakian producers in a much stronger position in the international markets.

"Fuel Briquets in 1927" is the title of a pamphlet by F. G. Tryon and J. M. Corse, issued by the United States Bureau of Mines. Its eight pages give detailed statistics of the American industry as well as world production.

Tool Steel Merger

Colonial Company Taken Over by Vanadium-Alloys

THE Vanadium-Alloys Steel Co., Latrobe, Pa., has acquired the Colonial Steel Co., Colona, Pa., according to an announcement by Roy C. McKenna, president of the former company. Both companies make tool and high-speed steels.

The Colonial company, founded in 1901, is capitalized at \$4,000,000, or 40,000 shares of common stock of \$100 par value, of which 32,500 shares are outstanding, and has an annual capacity of 57,600 gross tons of ingots produced in basic open hearth, crucible and electric furnaces. Its products, besides high-speed and carbon tool steels, include agricultural plates, plow steel, saw blanks, alloy and special steels, copper clad steel bars, spring, cutlery, section and alloy and high-speed steel sheets and forged die blocks, rings, bars and shapes.

The Vanadium company has electric furnaces rated to produce 6500 tons of ingots annually. Alloy steel ingots, carbon and alloy tool steels and high-speed steels comprise its products. The company about two years ago acquired the Anchor Drawn Steel Co., Latrobe, and in this purchase secured a plant for making drill rods. The capitalization is \$1,500,000, or 15,000 shares of common stock of \$100 par value. This will be changed to 210,000 shares of no par value and present holders of Colonial Steel Co. stock will receive 2¾ shares of the new stock for each share of their Colonial stock, or 89,375 shares.

No changes in the management of the Colonial Steel Co. are contemplated for the present, except that the sale of the products of the two companies will be coordinated. George P. Rhodes, T. Howe Childs and S. Clarke Reed will be the representatives of the Colonial company on the board of directors of the Vanadium company.

Meeting on Precise Linear Measurement

A meeting on measurement will be held in the Engineering Societies Building, New York, on the evening of Wednesday, Oct. 17, under the joint auspices of the Museums of the Peaceful Arts and the Machine Shop Division of the American Society of Mechanical Engineers.

Dr. George K. Burgess, director, Bureau of Standards, Washington, is to preside, and two papers will be given, the first by Prof. James A. Hall, Brown University, Providence, R. I., on "Measuring Devices, Primarily Manual," and the second by Prof. Earle Buckingham, Massachusetts Institute of Technology, Cambridge, Mass., on the "Development of Automatic Measuring Devices and Use of Optical Methods." An active discussion has been arranged for, after which the meeting

will be adjourned to the Museums of the Peaceful Arts at 24 West Fortieth Street, New York, to a loan exhibit of measuring devices, participated in by Pratt & Whitney Co., Brown & Sharpe Mfg. Co., Bausch & Lomb Optical Co., John Bath & Co., Jones & Lamson Machine Co., the Bureau of Standards, and others. This collection will be opened that night and remain on exhibition at the museum for one month. The meeting and the exhibit together will, in a word, deal with precise linear measurement and its development.

British Exports of Electric Furnaces Criticized

Criticisms of the policy of Sheffield, England, electric furnace manufacturers of selling their furnaces abroad in countries that have not been in the habit of making steel have aroused discussion in Sheffield among prominent steel makers.

C. G. Carlisle of Carlisle, Wiles & Co., well known Sheffield steel manufacturers, has pointed out two decided obstacles to a rapid extension of electric furnace plants in other countries. The first is the scarcity of existing forges and rolling mills. It is possible to manufacture steel wherever electric current is available and cheap, but, Mr. Carlisle points out, to work it up into shapes presents a larger financial problem. The second factor is the scarcity of suitable men willing to isolate themselves. This psychological factor is a contributory cause of the centralization of the industry and a preventive of its break-up.

Sheet and Tin Mill Wage Rate Is Unchanged

Tonnage rates for sheet and tin mill workers in mid-Western mills continue unchanged for September-October at 25½ per cent above base as a result of the bimonthly settlement last week. Average selling price of Nos. 26, 27 and 28 gage sheets shipped during the 60 days ended Aug. 31 was disclosed as 3c. per lb., unchanged from the average two months ago.

Ore Unloading Machine for Lackawanna Plant

An ore unloading machine of large capacity and having several new and improved features will be erected by the Bethlehem Steel Co. at its Lackawanna plant, Buffalo. Contract for the unloader has been placed with the Wellman-Seaver-Morgan Co., Cleveland, for delivery and erection in time for operation by the opening of the navigation season next year. This unloader will operate on the same tracks as five other machines of the same type installed 26 years ago.

The unloader will have a nontelescopic bucket of 17 tons capacity, a

receiving hopper with revolving disk discharge having an apron feeder mounted on a rotating frame and a belt conveyor with a traveling tripper. Ore will either be loaded into railroad cars standing on the first track inside the front leg, or stocked under the cantilever beyond the rear leg through the receiving hopper, apron feeder and belt conveyor with tripper.

The trolley with bucket will be designed for one trip in 50 sec. with 17 tons of ore. The machine proper travels 75 to 100 ft. per min. It will be electrically operated throughout. There will be a total of ten electric motors required ranging in size from 15 to 275 hp., with a total horsepower in all of over 900.

Industrial Stocks of Coal Still Decreasing

Stocks of coal on hand in industries of the United States and Canada Aug. 1 are estimated by the National Association of Purchasing Agents at 39,415,000 net tons. This is the lowest figure in many months. There has been an uninterrupted decline since the total, Oct. 1 last, of 60,154,000 tons. The supply is estimated as equivalent to an average of 36 days' use at present rate of consumption. This varies with different industries: By-product coke plants have 21 days' supply; electric utilities and coal gas plants have 51 days' supply; railroads have 36 days; steel mills, 35 days, and other industries, 38 days.

Industrial consumption in July is given as 33,527,000 tons, an increase of about 750,000 tons over June, but otherwise the smallest since last September. Production in the United States is given as 41,785,000 tons, which is 521,000 tons more than in June, but nearly 3,000,000 tons less than in May. Except for June and April, the July production was much the lowest in more than a year.

Combustion Engineering Acquires Boiler Company

The International Combustion Engineering Corporation, New York, has completed negotiations for the purchase of the Hedges-Walsh-Weidner Boiler Co., Chattanooga, Tenn., which was formed recently by a merger of the Casey-Hedges Co., maker of boilers and tanks, and the Walsh & Weidner Boiler Co., manufacturer of tanks and boilers, fabricated steel plate products and sugar making and special machinery. The acquisition rounds out the Combustion company's line of boilers, and with its facilities for making fuel burning equipment, the company is prepared to supply complete steam generating plants of any size. The Chattanooga company will be operated by the Combustion Engineering Corporation, which is the United States operating subsidiary of the International corporation.

Pittsburgh Coal Co. Says New Railroad Will Be a Benefit

WASHINGTON, Sept. 11.—Construction of branch lines of the Pittsburgh, Lisbon & Western Railroad from Smith's Ferry, Pa., to Youngstown, instead of setting up a monopoly for its controlling interest, the Pittsburgh Coal Co., will have the opposite effect, according to a reply filed by the company with the Interstate Commerce Commission in answer to protests made by trunk line carriers, including the Pittsburgh & Lake Erie, the Pennsylvania and Baltimore & Ohio Railroads.

The Pittsburgh Coal Co. answer declared that construction of the extensions will have a tendency to reduce prices of the commodity (coal) in the market reached through the rail and river route, the new line affording connection with the Ohio River. Such construction, it was pointed out, will benefit rather than injure the consuming public. The project, it was stated, will have the effect of holding in check "a monopoly that now exists, . . . that of railroad exceptants, who have hitherto enjoyed without real competition an excessively high rate on coal to the consuming public of the Youngstown district and the markets reached by coal from the Pittsburgh district. The sole effect of the grant of the application prayed for will be to furnish the Youngstown district with the cheaper rail-and-river system of transportation of this commodity."

The reply declared further that the proposed construction of the line would not be in violation of any law.

Welders to Discuss Pipe Structures and Aircraft

While all the details of the program have not yet been fixed, the main features of the American Welding Society's meeting in Philadelphia (jointly with the American Society for Steel Treating and the Institute of Metals) are as follows:

Tuesday, Oct. 9. Morning: Discussion of pipe welding in large plants, buildings and residences, led by R. A. Jack of *Domestic Engineering*. Afternoon: Welds at Elevated Temperatures, by Prof. C. Moser, Leland Stanford University. Design Stresses for Pressure Vessels, by S. W. Miller, Union Carbide & Carbon Research Laboratories.

Wednesday, Oct. 10. Morning: Discussion on welding for aircraft. Also J. H. Deppeler, chief engineer Metal & Thermit Corporation, will describe recent developments in European welding.

Thursday, Oct. 11. Afternoon: Symposium on structural welding and cutting: F. P. McKibben, consulting engineer General Electric Co., J. F. Lincoln, Lincoln Electric Co., and others.

Friday, Oct. 12. Morning: "Design of Machinery Parts by Use of Welded

Steel Shapes," by Messrs. Hague, Marthens and Brinton, Westinghouse Electric & Mfg. Co.

Wednesday afternoon will be devoted to inspection trips, of which several will be available. Meetings of special and research committees will also be held during the week.

Scrap Institute to Hold Various Local Meetings

The Institute of Scrap Iron and Steel, 11 West Forty-second Street, New York, has arranged a series of meetings in various cities to afford an opportunity to the leaders in each locality to meet with Benjamin Schwartz, director general of the institute, and to hear his message and discussion of the problems of the industry and the work of the institute. The tour of the director general will be begun with a dinner on Sept. 12 at the Tumble Brook Country Club, in Bloomfield, Conn., for the dealers in Hartford, Springfield, Norwich, Worcester, Northampton, Boston and surrounding territory. On Sept. 13 a luncheon will take place at the Hotel Taft, New Haven, Conn., for the dealers of Bridgeport, Meriden, New Britain, New Haven, New London, Norwich, South Norwalk, Stamford, Waterbury and Portchester, N. Y. A similar luncheon will take place in Newark, N. J., at the Newark Athletic Club on Sept. 19 for the scrap iron men of Hoboken, Jersey City, Kearny, Newark, Passaic, Perth Amboy, Phillipsburg, Plainfield, Somerville, South Amboy, Trenton, Asbury Park, Atlantic City, Elizabeth and surrounding territory. This will be followed up by meetings in New York, Philadelphia, Baltimore, Washington, Wilkes-Barre, Pittsburgh, Buffalo and Boston.

To Build Cold-Drawn Steel Plant at Buffalo

A plant is to be erected immediately in Buffalo by Bliss & Laughlin, Inc., Chicago and Harvey, Ill. The Buffalo plant will be devoted to the same products as are now being manufactured at Harvey and have been since 1891, covering cold-drawn steel in rounds, squares, hexagons and flats, and screw stock in open-hearth and special alloy grades and polished and ground shafting.

Paul J. Kalman is president Bliss & Laughlin, Inc. Walter R. Howell, vice-president and general manager, will be in direct charge.

Airplane at Steel Treaters' Convention

Greater attention than ever before is to be given the airplane at the annual convention and exposition of the American Society for Steel Treating at Philadelphia, Oct. 8 to 12.

F. T. Sisco, chief of the metallurgical laboratory at Wright Field, Dayton,

Ohio, is to present a paper at the technical sessions on "Steel Failures in Aircraft." Convention visitors will learn of the type of construction and material used in the engines, propellers and other parts of planes used by Col. Charles Lindbergh and other famous flyers. Among the leaders in the air industry who will be at the convention are W. B. Stout of Stout Air Service, Inc., Detroit, and E. P. Warner, Assistant Secretary of the Navy for Aeronautics.

Important discussions will cover the development of duralumin, of which all-metal planes are made. Attention also will be given the construction of feed and oil pipes, the breaking of which has caused so many flights to fail. Prominent in the discussion will be the methods of manufacture, with demonstrations of both welding and riveting. Of interest, too, will be the adaptation of the X-ray for the detection of flaws in metals. This work will also be demonstrated. W. H. Eisenman, secretary of the society, is arranging for an aircraft display at the exposition.

Wide Sintering Machine for Indiana Harbor

Under a license from the American Ore Reclamation Co., the Youngstown Sheet & Tube Co. is installing a Dwight and Lloyd sintering plant at its blast furnaces at Indiana Harbor, Ind. There will be a Dwight and Lloyd machine 72 in. wide and 63 ft. 9 in. long, with a rated capacity of 650 tons of sinter per day from blast furnace flue dust. The material to be treated consists of the dry dust from the down-comers, as well as the filter cake recovered from the gas washers.

This is the third of this type of machine to be installed. The original machines were 42 in. wide. The first 6-ft. machine was built for the Chateaugay Ore & Iron Company, Lyon Mountain, N. Y., for sintering concentrates. The second wide machine was installed this year by the Buffalo Sintering Corporation at Buffalo in its custom sintering plant.

Steel Framed Houses at Boston and Pittsburgh

Model, firesafe houses, entirely framed of steel, are soon to be opened at Boston and Pittsburgh by the Broderick Firesafe Homes Association, Inc., 358 Fifth Avenue, New York, as a part of a nationwide program of the association. The houses will embody other features such as aluminum shingles, asbestos board subflooring and cork insulation. The Pittsburgh house, located on Ardmore Boulevard at Edgewood Acres, will be opened on Oct. 8. The A. & S. Wilson Co., Pittsburgh, is general contractor. The Boston house, which will be opened on Oct. 14, was built by Rogers & Sullivan, Boston, and is located at Longwood and Pine Roads, Milton, Mass.

Manganese Needs Research and Tariff

Producers' Association Told That Preparedness Requires Prices High Enough to Bear Cost of Solving Low Grade Ore Problem

WASHINGTON, Sept. 11.—Sounding a note of confidence that a domestic manganese ore industry is on the threshold of being firmly established, the American Manganese Producers' Association at its first annual meeting at the Mayflower Hotel adjourned this afternoon, following a two-day session. Problems in research of processes of converting low-grade material into that of standard commercial analyses, to meet the requirements of the steel industry, and realization of the present difficulty of interesting capital to invest in the industry were all considered at the meeting. There was an attendance of approximately 50 representatives of the industry.

Summarized, the meeting gave the assurance that within a few years the industry would be able to meet all domestic demands. It was in substance declared that the United States has large visible and enormous potential amounts of manganese supplies, which through beneficiation can, with further development of processes, be worked into high-grade material. Demand was made that the present tariff on manganese be maintained or increased.

Officers Reelected

Officers were reelected, J. Carson Adkerson, Hy-Grade Manganese Co., again being made president and chairman of the executive committee, which was renamed. The new directors elected were: C. D. Hutchens, Manganese Ore Co., Watauga Valley, Tenn.; Ottomar Stange, Stange Construction Co., Philadelphia; W. R. Spencer, Luna Manganese Co., Jackson, Mich.; W. J. Staunton, Cuban American Manganese Corporation, New York, and Herbert Wilson, Union Carbide & Carbon Co., New York.

Russian Supply Unreliable Because of Economic Instability

In his address of welcome to the delegates, J. Carson Adkerson, president, declared that much has been accomplished since the association was formed on Aug. 2, 1927, in Washington. Tracing the history of the domestic manganese industry, he said that as a national institution it was born during the World War, cast aside as an orphan during the post-war period and was finally adopted by the manganese producers themselves "and today it takes its place as a growing industry among the basic industries of the United States."

Touching upon the world situation, Mr. Adkerson said that among all the principal steel producing countries, none has produced, within its own boundaries a sufficient supply of

manganese to meet its own needs. The United States draws some manganese from India, Africa and Brazil, but a large part has been coming from Russia. Disturbances in Europe would seriously impair, if not entirely stop the flow of manganese to this country. "For the past several years I have attempted to call attention to the instability of the manganese situation in Russia," said Mr. Adkerson. "Today we hear the announcement that the American interests have withdrawn from the Russian fields and that the manganese concessions have been returned to the Bolshevik government."

Our Problem Is to Concentrate Low Grade Ores

After speaking of developments which had taken place in America, he pointed out that there is still a wide field of opportunity for further improvements in the development of low grade ore reserves. "During the past years we have seen many new methods of beneficiation brought to light," said Mr. Adkerson. "Foremost among these are the roasting of rhodochrosite ores in Montana; the development of the Bradley process of leaching with sulphate of ammonia; the work of the Bureau of Mines station at the University of Minnesota in manufacturing ferromanganese from manganiferous iron ore; the sulphur dioxide processes; magnetic separation; and sintering manganese ore both to raise the metallic manganese content and to make the material into a form most suitable for steel furnaces. Instead of attempting to copy iron ore mining practice, let us turn for our inspiration to the zinc industry. We see the zinc operators mining and treating, at a profit, ore which runs 1.5 per cent zinc, but in our industry, we have been content to ignore or discard as tailings material running from 10 to 30 per cent metallic manganese."

In the first of a series of remarks on reserves of manganese ore in various States of the country and Cuba, L. B. Miller, Cleveland, said that substantial contribution by Arkansas to tonnage of high grade ore must, like many other States, wait on suitable methods to transform its low grade ores into high grade. Its well-located and enormous tonnage of low grade ore will then make it a powerful factor in high grade ore supply, but, in his opinion, not until then. He suggested that the major work of the American Manganese Producers' Association is not the discovery of ample manganese ore, high grade in its original mineral condition, but rather that the conversion

of low and medium grade manganiferous and ferruginous manganese ores into high grades be given close study.

Cuban Ores Will Benefit by New National Highway

Armando Roa, commercial attache of the Cuban embassy, showed that exports of manganese ore from Cuba to the United States for the two years, 1926 and 1927 totaled 297,766 tons, valued at \$6,518,736. The richest manganese mines are located in the province of Oriente and the majority of shipments were of metallurgical grade, carrying 46 to 48 per cent manganese. A serious handicap to the development of manganese in Cuba has been the lack of transportation facilities and the inaccessibility of most of the mines. This, it was declared, will be entirely overcome in the near future when the new national highway, now under construction, will be opened for traffic.

Montana and Virginia Ores

Speaking of reserves in Montana, E. L. Blumenthal of the Montana Laboratory Co., said that State produced one-half of the manganese produced from domestic sources during the World War. The industry has languished lately, and shippers of 35-per cent manganese had been forced to suspend. But, he added, optimism has returned, due chiefly to developments in beneficiation. Reserves in the Philipsburg district alone amount to 1,320,000 tons of ore grading 35 per cent or better. Reserves in other districts are also large. He spoke of one company which has contracted to supply 125,000 tons during the next five years. The treatment of rhodochrosite ores in Montana by the Domestic Manganese & Development Co., was described by Mr. Blumenthal. A nodulizing process is used which produces material of proper size and characteristics for use in the blast furnace. The material analyzes as high as 52 per cent manganese. Ore at present is drawn from the Butte district, but later on will be taken from the Philipsburg and other districts.

E. M. Massey of the Hy-Grade Manganese Ore Co., spoke especially of properties at Mineral Ridge, Va., and said shipments of 300,000 tons of hand-picked ore had been made from that property. With the installation of a plant, it is expected, to produce 25,000 tons of 45-per cent ore during the next year. Dr. J. S. Grasty of the University of Virginia, also said that the country is on the threshold of a large and profitable production of manganese ore.

William H. Kemler, chemical and mining engineer, Johnson City, Tenn., spoke of the possibilities of rhodochrosite in eastern Tennessee and the Carolinas, but M. D. Lavino of Lavino & Co., said he did not think they were rhodochrosite ores but were calcites containing 7 to 9 per cent manganese. He would not

recommend that any one attempt to concentrate the so-called rhodochrosite ores of Tennessee.

Emergencies Need Active Operations Not Dormant Reserves

Every possible step should be taken to guarantee to the steel industry an uninterrupted supply of manganese ore, said A. H. Hubbell of *Engineering and Mining Journal*, New York. Mr. Hubbell recalled our dependence during the World War and declared that any lack of manganese will jeopardize the national safety in time of war and its prosperity and well-being in time of peace. Development of manganese resources of this country, it was said, require adequate tariff protection. Research likewise is contingent upon the tariff, "for without the latter the domestic industry, now in its small beginnings, would cease to exist and neither government nor private capital would be interested in a non-existent industry."

The speaker challenged the idea that the best way of insuring a supply of manganese for use in war emergency, when foreign sources of supply may be cut off, is to hamper development of the manganese within our borders. Those advocating such a practice underestimate the time that would be required to resuscitate the dead or dormant industry. Furthermore he added, by shutting down the industry research would be killed and so the country would be at a loss to utilize the low-grade manganese ore when the emergency arrived.

Position of Strategic Minerals

At a dinner given at the Mayflower Hotel, Monday evening, Maj. Alfred H. Hobley of the Air Service, listed nine strategic minerals: Manganese, antimony, mercury, chromium, platinum, tungsten, nitrates, quicksilver and tin. Major Hobley, who is engaged in studying these and other materials whose domestic supplies are considered inadequate for time of emergency, declared that three questions are presented in the study; first, methods of stimulating production; second, creation of reserves; and third, development of substitutes in ample quantities. The first question, that of stimulating production is eliminated altogether where there are no domestic supplies. Regarding the second point, it was pointed out that with the passing of time and development of new methods and new uses of materials, it has been found in certain instances that such reserves would not be needed. Moreover, creation of reserves involves considerable expenditure and the desirability of creating a stock pile is a much disputed point. The last factor, namely use of substitutes, was said to be a promising possibility in the case of manganese.

Concerning tin, Major Hobley said that a grave shortage would be experienced if imports were interrupted, yet he explained that inasmuch as

the Army operates under extreme conditions, the situation might not be embarrassing in some circumstances, because it may be able to preserve food without use of tin containers. Tungsten was said to have proven satisfactory in replacing platinum for electrical contacts, though the problem of a probable shortage of tungsten still remains.

For nickel steel it might be possible to substitute molybdenum or manganese steels, Major Hobley said. Heat treated duralumin now is being used for tubing in the fuselage of airplanes, replacing alloy steels and wood. The day of all-metal planes is just arriving—one of the outstanding changes being the use of metal instead of spruce for structural members.

Herbert W. Smith, Union Carbide & Carbon Corporation, who presided as toastmaster, expressed confidence that the domestic manganese industry would be established and urged that the industry continue its research with that end in view. He also strongly urged that the tariff on manganese ore should be maintained.

Manganese Ore Resources of the Country

E. F. Burchard, United States Geological Survey, speaking on "Types of Deposits, Their Use and Method of Treatment," expressed the belief that the United States has wonderful resources in ore and that it will make good in its production and marketing. He said surveys so far made by the Geological Survey had disclosed 297 deposits of manganese ore through the country.

In a paper on "Grades and Character of Ore Desired by the Market," prepared by John J. Howard, E. J. Lavino & Co., and read by M. D. Langhorne of that company, it was declared that domestic producers of manganese ore show a woful lack of knowledge of the kind of ore suitable for makers of ferromanganese. Pointing out that the alloy must be 80 per cent manganese, $\frac{1}{4}$ per cent phosphorus and 1 per cent of silica, it was stated the base of ore should be 50 per cent manganese and 5 per cent silica. It was emphasized that domestic manganese ore for the most part did not measure up to the standard. Analysis showed that the domestic ore ranges from as low as 5 per cent and as high as 20 per cent in silica. Emphasis was laid on the fact that each 1 per cent increase in silica content in the ore materially increased the cost of producing ferromanganese. Comparison was made between foreign and domestic manganese ores in favor of the latter.

The William B. Pollock Co., blast furnace builder, has received a contract, estimated at \$1,000,000, to rebuild the Illinois Steel Co.'s No. 11 blast furnace at Gary, Ind.

Pioneers of Industry to Be Honored on Oct. 24

Charles M. Schwab, Henry Ford and Thomas A. Edison will be among the guests of honor at a dinner for pioneers of American industry to be given in New York the evening of Oct. 24 by Columbia University and the Institute of American Meat Packers in cooperation with the Chamber of Commerce of the State of New York and the Merchants' Association of New York. Other guests of honor will be Orville Wright and Glenn H. Curtiss, representing aviation; Julius Rosenwald, merchandising; George Eastman, photography, and Harvey S. Firestone, rubber.

The dinner will be preceded in the morning by a conference of major industries held under the same joint auspices. At this conference a leader from a number of fields will discuss the situation of the business or industry from which he comes. Myron C. Taylor, chairman finance committee United States Steel Corporation, will represent the steel industry; Alvan Macauley, president National Automobile Chamber of Commerce and the Packard Motor Car Co., the automobile industry; Franklin D. Roosevelt, president American Construction Council, the building construction industry; Walter S. Gifford, president American Telephone & Telegraph Co., communications; Frank B. Noyes, president Associated Press, publishing, and Charles E. Mitchell, president National City Bank, New York, finance. A speaker for the railroads is to be announced later.

Mackintosh-Hemphill Co. Is Reorganized

A reorganization of Mackintosh-Hemphill Co., Pittsburgh, has been consummated and new interests have taken over the management of the company. The board of directors of the reorganized company consists of H. V. Blaxter, John W. Chalfant, Edwin Hodge, Jr., Herbert A. May, J. H. O'Neill, W. C. Rice and T. C. Ward, and the following officers have been elected: H. V. Blaxter, chairman of the board; F. H. Moyer, vice-president; W. C. Rice, treasurer, and D. H. Baum, secretary and assistant treasurer.

The company is the oldest among those engaged in the manufacture and engineering of all classes of rolling mill construction. It was founded in 1803, and after 119 years of continuous operation, it was expanded by the acquisition of the A. Garrison Foundry Co., Pittsburgh, the Pittsburgh Iron & Steel Foundries, Midland, Pa., and Woodard Machine Co., Wooster, Ohio.

The Ames Shovel & Tool Co., Boston, has removed its sales and administrative departments to the factory at North Easton, Mass.

This Issue in Brief

"Cutting prices below cost is demoralizing, damaging and economically wasteful," says T. J. Foster. "Once a standard of business conduct is generally accepted, violators will be treated as business outcasts."—Page 635.

* * *

Users of alloy steels should be provided with dependable performance data, says metallurgist. Many producers are not acquainted with pertinent facts concerning their product, he charges, and misinformation is being circulated.—Page 633.

* * *

Seeks new uses for cold-rolled shafting. "This superior material should find new uses and research might point the way to lower production costs," J. R. Miller says.—Page 637.

* * *

Steel sets new August production record. Daily output of ingots was 154,759 gross tons, a gain of 1.5 per cent over July, while the gain in the month's total was 9.6 per cent. August made the highest record for any month in any last half.—Page 641.

* * *

Simplifies manufacturing problems in automobile body construction by stamping large pieces. Entire sedan side is made in one piece; four pieces form complete body. Single stamping withstands stresses better than jointed piece, provides greater strength and more accurate fitting.—Page 623.

* * *

Sheet steel jobbers object strongly to cut in 10-day cash discount rate. Declare they need the 2 per cent discount to provide them with a fair profit. Producers say that one-half of 1 per cent discount is adequate, as money can be borrowed at 6 per cent.—Page 640.

Cuts operating costs by paying bonus for reduced repairs to production equipment. Repair foreman and helpers are paid a premium for keeping down repair costs, and each machine operator in Chinese nail plant is given a production bonus as well as a premium for saving on cutters and dies.—Page 626.

* * *

Stainless iron proves its suitability for aircraft use. Physical and anti-corrosion properties are satisfactory, and the metal fabricates and machines well.—Page 627.

* * *

Ford apprentices alternate daily between class room and shop. Course covers 2½ years, and class hours are set so that, no matter what shift the student is working, he has suitable time for theoretical training.—Page 631.

* * *

Confusion exists in tests of metals at high temperatures, says metallurgist. Declares that tests should be standardized, as considerable difference of opinion exists as to which test results should be considered most reliable.—Page 633.

* * *

Electric power an important factor in doubling output of ore mines in tons per man. From 1922 to 1927, during which electric power consumption in representative underground mines increased from 4 to 8 kwhr. a ton, mining efficiency doubled.—Page 634.

* * *

Is there a scarcity of scrap? No, says editorial writer. Prices have been too low to cover the cost of gathering old material. The rush to cover on the part of dealers who sold short creates an impression of scarcity.—Page 653.

When welding stainless iron, be sure the operator is furnished with the instructions provided by the producer of the metal. Otherwise trouble may be expected, says aircraft builder, finding that breaking load of welds varies markedly with the way the welding is done.—Page 628.

* * *

Great need exists for a steel with an ultimate strength of 90,000 to 95,000 lb. per sq. in., yield point of 60,000 to 65,000 lb. and ductility of 30 to 35 per cent elongation, says research director. Plain carbon steels having these strengths fall below the required ductility figures, he declares, when made by present tonnage methods.—Page 633.

* * *

In machining stainless iron, use high-speed steel cutting tools, metallurgist recommends. Attention should be given to the shape and position of the tools, to avoid "dragging." In annealed condition, stainless iron machines readily.—Page 630.

* * *

Five-day week would result in lower production and higher costs for most industries. While labor leaders declare that shorter week would increase production, due to saving from human fatigue, this would apply only to those organizations permitting human driving.—Page 653.

* * *

"Interdependence of competitors is winning general recognition," declares steel fabricator. Taking business at less than cost will in time be regarded as a business crime. Mills should refuse to sell to price cutters, for the entire industry is injured by accepting unprofitable work.—Page 635.

THE IRON AGE

W. W. MACON
Managing Editor

ESTABLISHED 1855

A Much-Needed Code

FROM the picture Mr. Foster paints in the interview put before IRON AGE readers on another page, competition in the steel fabricating industry has reached a stage at which academic discussion is ruled out and only practical remedies are worth considering. By some Mr. Foster's proposal of a code of practice governing the relations of structural steel mills and companies fabricating such steel may be taken as simply another contribution to business ethics, one likely to fare hardly in that field of two-fisted competition. Yet, carefully examined, the plan will be seen to have teeth. These sentences, for example, plainly look to a regime under which the steel producer will accept a new responsibility, one that may involve a refusal to sell a fabricator who has become known as a chronic price-cutter:

Once a standard of business conduct is generally accepted, violators will be treated as business outcasts. Fabricators, acting on their own individual initiative, but without doubt in numbers sufficient to make themselves felt, will sever all relations with a competitor who indulges in practices that threaten the industry. Nor are they likely to continue to patronize a mill that has so little interest in their common welfare as to sell steel to such a fabricator.

As Mr. Foster points out, a fabricating shop works to specifications, so that mass production cannot figure in any such way as to work great operating economies. Shop methods are so far standardized that there are no wide differences between the costs of competing plants. An unsuccessful bidder can quite well take the measure of the profit or loss of his competitor who receives the award. Thus, it is held, the proposed code does not fall into the category of cooperative measures designed to stabilize prices by bolstering the weak and inefficient. Rather it aims to unite the influences in the trade which are committed to sound practice and to eliminate those factors which work for low morale.

Much will doubtless be said as to the difficulties in the way of making and enforcing such a code. It would be a mistake, however, for steel producers and fabricators to treat the proposal and the comment that goes with it as just one more of the common run of complaints of the scant profits of making and working in structural steel. The situation is one that calls for candid expression, sound thinking and decisive action.

WAGE-EARNERS in the metal-working industries of the country had a purchasing power nearly 12 per cent higher in July this year than in July last year. Weekly wages paid in automobile, iron and steel, elec-

trical goods and agricultural implement manufacture and in foundries and machine shops and railroad car building and repair shops, averaged \$33,561,000 in July against \$30,006,000 in July, 1927. For all industries, however, the weekly factory pay roll, amounting to \$81,147,000, was 1.9 per cent smaller than in the preceding July. The recent upward trend in business is indicated by the decreasing difference between pay rolls of corresponding months of the two years. Whereas April showed nearly 7 per cent smaller pay rolls for all industries, May pay rolls dropped 5.8 per cent under May, 1927; June was off 3.3 per cent, and finally July, as stated, only 1.9 per cent.

A New Record in Steel

STEEL ingot production in the United States in 1928, it now seems likely, will make a new high record. In the first eight months the total, for open-hearth and Bessemer steel alone, was 32,783,000 tons. Estimating crucible and electric steel at 275,000 tons, we have 33,058,000 tons. Against this the highest record for eight months was 31,775,768 tons, or roundly 1,280,000 tons less. If the remainder of the year should but equal the very moderate production of the last four months of 1927—12,887,000 tons—the 1928 total would be 45,945,000 tons, or within 1,000,000 tons of the 1926 record of 46,936,205 tons. But we are now going, on the basis of the August daily figures, at a gait 19½ per cent higher than in 1927. If we average only two-thirds of that excess during the final four months, we shall end the year with a total of 47,600,000 tons, or more than 650,000 tons beyond the great output of 1926.

Whose Five-Day Week?

IN his last Labor Day speech William Green, president of the American Federation of Labor, heralded the early advent of the time when labor would enjoy two holidays in every week. Progress in this direction was characterized as the outstanding achievement of the labor unions in the last year. The objective may be described as employment for hire for only 250 days a year, or say 2000 hours. Expressed in that way, which is arithmetically the same as five days a week, but quite different in its implications, it reflects a condition that obtains in many industries owing to seasonal and other reasons, and is not liked.

We have never heard any clear statement of just what unionized labor means and wants in respect to a five-day week. Is it wanted only for some workers or for all? If the latter, is it contemplated to have a com-

plete cessation of labor as in two Puritan Sundays? What then would people do?

Even now we have to run our railroads on Sunday, and likewise our trolley lines, subways, water works, illuminating plants, hotels and divers other things. A good many industrial operations are incapable of being halted.

Many carpenters, bricklayers, plumbers and other artisans now refrain from going to work on Saturday. Not a few of us have had the maddening experience of something going wrong in household mechanics on a Friday evening, with the inevitability of a wait until Monday (or Tuesday if an extra holiday intervenes) before it can be fixed. Doubtless even a bricklayer objurgates the plumber in such an event. We imagine also that all of the enjoyers of the Saturday holiday like to be able to shop on that day, and want their morning paper, milk and gasoline on Sunday. Mr. Green should tell us how organized labor proposes to arrange such matters.

Of course the great economic question is what effect a five-day week would have upon production, supposing it were to be limited to miners, factory workers, and artisans. Organized labor answers off-hand and glibly that it would increase production owing to the saving from human fatigue, and immediately cites the precedent in Mr. Ford's works. On the other hand it is well established that a five-day week has not increased the production of bricklayers. Mr. Ford, as we have pointed out in other connections, has a unique industrial organization that permits human driving; but it is inconceivable that the application of his principle to a blast furnace would produce any benefit. Nor would it in our manufacturing industry in general. What would really happen would be a further immobilization of our costly plant for production.

Low Prices for Petroleum Products

AN article in the last number of the *Lamp*, the house organ of the Standard Oil Co. of New Jersey, says that the consumption of gasoline in the United States in 1900 was only 2,000,000 barrels, while the consumption in 1928 will probably be about 390,000,000 barrels, most of which will be used by motorists. The barrel of gasoline is 50 gallons. The article goes on to comment: "Gasoline has not kept pace with the rising trend of commodities. Actually its cost is lower now than it was in the infancy of the motor car business and, if its production in miles be considered, it probably costs less today than in an intervening period when its price per gallon was lower."

In good practice the petroleum refiner gets about 30 gallons of gasoline out of a 42-gallon barrel of crude oil. This gasoline last January was selling at about 5¾ cents per gallon, in the wholesale market in the mid-continent area, and at 7¾ cents on the Atlantic seaboard. About the mid-year the prices had risen to 9¾ cents and 11¾ cents respectively, which has been very good for the refining companies, the price for crude oil having remained substantially unchanged at the low level.

This latter condition is likely to continue, for any advance in the price for crude would immediately develop increased production from the several fields that are recklessly exploited and possess an immense poten-

tiality for pouring out an even greater flood of oil than they now produce. Their wastrel owners should therefore be left to fry in their own fat, and while their stockholders may deserve some sympathy their managers do not.

The refiners, however, while now enjoying good times are unable to have everything their own way, for increase of their margin attracts competition. Even now California gasoline is being offered in the New York market at a shading of price, which indicates that the latter has topped. In short, the whole petroleum business is strongly competitive and perhaps there is no commodity in respect to which the consumer has less ground for complaint. The difference between the price he pays at filling stations and the price the refiner realizes is of course the remuneration for the cost of distribution, which involves the use of a large amount of capital, as every automobilist from his own observation can understand. Indeed, the thoughtful observer might get the idea that not only are our own roadsides unnecessarily defaced, but also that he has to pay the price for an overbuilt and overmanned trade.

Increasing Outcome of Scrap

A RECENT sharp rise in the Pittsburgh district scrap market and tightness reported in other districts might suggest that scrap as a material has grown "scarce." That is not the case. It is a matter of prices. The short sales of dealers were at too low prices. Who made the prices so low is a moot question which need not be discussed here.

There is a certain cost, though a varying one, in the gathering of old material and when the market price does not cover this cost and freight the material is not gathered. Not a great deal of the scrap consumed is subject to this influence, which may however be enough to regulate the supply at times, at least taking the edge off open market fluctuations.

There is no general rule as to the average length of time steel remains in service before it becomes scrap, nor is there any specific information as to whether that length of time, whatever it may be, is tending to increase or decrease. One thing, however, we do know, and that is that up to 1916 the production of both pig iron and steel was increasing rapidly. Since then the increases have been at relatively a very moderate rate. The suggestion is clear that the outcome of old material should now be increasing year by year at a much greater rate than production of pig iron and steel is increasing.

These market advances in scrap have not as a matter of fact put scrap up to what might be called its "intrinsic" value, relative to the value of pig iron, since in making steel either scrap or pig iron must be used. Each steel mill has its own system of appraising the value of pig iron, for the mill making its pig iron itself does not consider market value, but cost, and in counting what might be called intrinsic cost, various items are considered, an important one being profits from by-product coking operations.

There is an enormous store of iron and steel in the country, chiefly in service, though undoubtedly there is no small tonnage that is simply awaiting the time when it will pay to take it up and supply it to the market. The total is probably far in excess of half a billion tons, which means cumulative production plus imports, minus

exports and losses of material by rusting and too minute division or extensive distribution. Thus obviously there is much opportunity for scrap to come out. In the case of the railroads, which account for considerably more than a hundred million tons, the monthly outcome is fairly steady.

Post-War Economy

THERE is something satisfying and reassuring in counting up the expected post-war dangers the American people have avoided. Emerging from the war with large profits and with labor in easy position both as to wage rates paid and the service expected from the wages, there were fears that the country would run through a period of extravagance, involving injudicious investment of capital in construction work as well as wasteful spending by wage earners. Those fears were at the time quite reasonable, and for somewhat over a year after the Armistice the country did run much along such lines. The course was brought up with a sudden turn and then people settled down to harder work and judicious expenditure.

In many and important respects we have been on an economical basis in the last few years, in that we are getting good things, necessary and worth-while things, on a low cost basis. With almost identically the same number of freight cars as on July 1, 1914, the railroads are performing about 45 per cent more freight service than in any year before the war and are doing it more expeditiously. The quality of the service is improved in addition to the quantity, and the railroads are not under the necessity of making relatively large capital expenditures.

Complaint about the coal and oil industries being overdeveloped is from the viewpoint of owners. In coal at least, they do not receive a reasonable return, but the country is furnished coal and oil at very low cost. Money is not being spent extravagantly or wastefully for coal or oil.

The automobile was pictured by many as a serious economic danger. It was a favorite remark that people were mortgaging their homes to buy automobiles and by and by they would have only the mortgages. It has turned out that the people were able to replace their worn out cars and year by year there are more owners. Cars are cheaper and more efficient and they can be made to last longer if desired.

Dwelling house construction at very high, possibly temporarily high, cost was considered a danger. Costs have declined but no serious trouble has been caused and the homes are serviceable. Costs are still too high, considering what a day's labor produces in various manufacturing industries, but there is no longer any fear of a disturbing slump.

Steel has improved greatly in quality and the production cost has gone down. The relation of price to cost is very favorable to the consumer, as shown by the light earnings returns of producers relative to capital investment. Considering the service rendered by improved quality steel at present prices is very cheap indeed.

We have been doing a great deal of our work most efficiently and economically. We have not had a post-war period of extravagance and waste, and one cannot but recall that there seemed to be great danger of this very thing.

Of course many items can be cited on the other side. No doubt the people are paying altogether too much money year by year for various "nationally advertised" and expensively advertised products, but there would be no great derangement if the people found it necessary or desirable to cut down such expenditures. It would not be the same as having a lot of idle railroad equipment or factories or buildings on our hands. Men may be working too short hours and too many may not be working at all, but when in employment men work harder and accomplish more than they did in the first year or two after the war.

CORRESPONDENCE

Ethical Buying and Ethical Selling

To the Editor: Your editorial of Aug. 30 on "Purchasing Agents and Profits" touches one of the most important phases of the profitless prosperity discussion in its reference to the relationship of buying and selling in the same organization. Of course, a considerable proportion of our production is purchased by governmental agencies, railroads, public utilities and educational institutions, and they do not sell a commodity that would bring them directly into this comparison.

The industrial organization of today, in which management has become the dominant factor according to many writers, is composed of several highly specialized divisions; mechanical, selling, engineering, purchasing, advertising and financing probably being the most prominent. Surely, it is necessary to coordinate these various functions of management and the well managed organization requires, and usually has, a definite policy controlling all its functions.

A satisfactory sales policy and an unsatisfactory purchasing policy or vice versa can hardly make a sound combination and would be unusual. Successful producing con-

cerns cannot hope to dignify or concentrate on one or more functions of management and neglect the others, for each of the functions must to some extent at least be considered as representative of the organization's policy.

The purchasing department is and should be as representative of the organization as the sales department. The firm is judged by one as well as the other, and failure to have representative men and methods in one is as serious a mistake as neglect of the others would be, for each has a necessary work to perform that does not conflict with or lessen the value and importance of the other divisions.

G. A. RENARD,

Secretary-Treasurer National Association of
Purchasing Agents, Inc.

New York, Sept. 5.

Fabricators Ask for Relief from Anti-Trust Laws

To the Editor: I am inclosing a copy of a letter which the Structural Steel Board of Trade of New England has voted to send to the Chamber of Commerce of the United States and also to the proper authorities in Washington.

While there have been expressions of widespread dissatisfaction with the application of both the Sherman Law and Clayton Act by many individuals and from all lines of industry, this is the first time, I believe, that an industry has

made an open and frank appeal for relief from the application of these statutes as at present construed by our courts. We are led to do this by the conviction that unless these statutes are amended or repealed our industry, representing millions of dollars of investment, is threatened with disaster.

We would be the last to deny that, at the time these acts were passed, the country was suffering from evils which it was essential should be restrained. We do not believe that even now manufacturers should be free to enter into agreements or combinations which would result in the public's paying an unfair price for their products. But we do believe that the manufacturer is entitled to a fair and reasonable profit and that this right should be just as firmly guaranteed and protected as that the consumer should not be forced to pay an unfair price for what he buys.

The justice, nay, necessity, that corporations should receive a fair return for their efforts is recognized by both the Federal Government and the States with respect to public service corporations. The Federal Government has established rates and tariffs for the railroads calculated to produce a given net revenue upon the invested capital. Here in Massachusetts the State fixes the price of gas and electricity at levels which are intended to return a fair rate of interest to the stockholders, and our own Boston Elevated Railway has been guaranteed for years a 6 per cent rate of dividends.

Private Competition Construed as Warfare

But when it comes to private enterprise the attitude of our courts and lawmakers (and, indeed, the public in general) is something different again. It is quite similar to that of the spectators at a cock fight. Their only interest is to see which of the two combatants will succeed in killing off the other. And the competition within the industry is precisely that of a cock fight, whether the industry happens to be textiles, shoes, oils, coal, silk, steel or any other of an essential nature.

As the Sherman Law and Clayton Act are now construed it is demanded of manufacturers of similar articles that they fight each other to the death. No friendly or co-operative act may be indulged in if, as a result thereof, the article they manufacture is increased in price one mill. The result is inevitable. We are having industrial warfare carried to the point of ruination in industry after industry, and all because thirty years ago certain large groups carried their activities to a point that was harmful to the general welfare.

We submit that this situation is intolerable and in no sense what the framers of the Sherman Law and Clayton Act had in mind as the purpose of those acts. Those acts were intended to break down great monopolies and to prevent the forming of others and not to operate to compel the independent industries to fight each other to the death. The only alternative to that result is to drive the independents into consolidations and mergers, which is precisely what the framers of the two acts in question intended to prevent.

Inadequate Prices for Fabricated Steel

When you build a house you now pay the carpenters \$1.37½ an hour. When the Sherman Act was passed you paid not over 40c. This increase has been brought about solely through the combined efforts of organized labor, supported by public opinion. But you are paying no more for

fabricated steel now than you did then, despite the trebling of wages, due to economies in and improved methods of manufacture and the almost entire elimination of profits.

If labor is permitted, through concerted action, to raise the rates of wages to the utmost that the situation will bear, should not some way be provided so that those who pay these wages, and supply the opportunity for obtaining them, should receive a reasonable return on their investment and for their own efforts?

CHARLES N. FITTS.

Boston, Aug. 13.

The letter referred to by Mr. Fitts in the foregoing is as follows:

Aug. 13, 1928.

To the United States Chamber of Commerce,
Washington, D. C.
Attention: Committee on Sherman Law and Clayton Act.
Gentlemen:

The Structural Steel Board of Trade of New England respectfully addresses your attention to the condition of the structural steel industry in this section of the country. The operation of the Sherman Law and the Clayton Act is responsible, we believe, for the fact that practically no profits have been made in this industry in New England for the last five years, and that relief must be had from the operation of these statutes as construed by the Courts if this industry is to survive in New England.

This industry represents and requires a larger investment of capital than other lines of industry, is fundamental to the development of any community, proved its absolute necessity to the Government in time of war, and is entitled to reasonable compensation for its service. It is being completely demoralized by the operation of those statutes.

We shall appreciate any suggestion from your committee as to what may be done by us to aid any effort addressed to a revision or revocation of those Acts or to legislation in substitution for them.

Board of Governors, Structural Steel Board of
Trade of New England.

By Charles N. Fitts, Chairman.

Production of Magnesium Increases

In 1927 production of metallic magnesium in the United States (according to J. M. Hill of the United States Bureau of Mines) was 366,400 lb., worth \$441,700, an increase of about 13 per cent in both quantity and value over 1926. The average sales price of magnesium ingot for 1927 was 68c. per lb.; powder, \$1.56 per lb.; castings, \$1.84 per lb. Castings amounting to 31,990 lb. are reported by "Mineral Industry" as sold in 1927, a decrease of 13 per cent from the previous year. Ingot sales increased 6 per cent over 1926 and were 69 per cent of the total magnesium sold.

Gann and Winston, of the Dow Chemical Co., leading producer of the ingot, in a paper in *Industrial and Engineering Chemistry* say that the continuous electrolysis of the fused chloride is the most general method of manufacture for magnesium and bids fair to bring the price low enough to compete with aluminum. The same authors give precautions for foundry work with the alloys, showing radical departures from older practice. A mixture of magnesium chloride and potassium chloride is used as a flux, varied by the substitution of sodium chloride when pure magnesium is to be cast. The elimination of impurities from the castings is accomplished by a mechanical washing, and scrap is cleaned by the same process.

Schedule of the next instalments of the Business Analysis and Forecast, by Dr. Lewis H. Haney, Director New York University Bureau of Business Research, follows: Sept. 20—Position of Iron and Steel Producers; Oct. 4—Activity in Steel Consuming Industries.

Iron and Steel Markets

Prices of Primary Materials Rising

Country-Wide Advances in Scrap and Additional Increases
in Pig Iron Prices—Heavy Specifying Builds Up
Mill Backlogs

COUNTRY-WIDE advances in scrap prices, further evidences of strength in pig iron and the accumulation of substantial backlogs in finished steel are salient features of the iron and steel market.

Heavy melting scrap at Pittsburgh has gone up 75c. a ton, making a total recovery of \$2.75 from the low point reached in July. At Philadelphia the week's advance in heavy steel scrap was \$2 a ton, and at Birmingham, \$1.50 a ton, while increases at other market centers ranged from 25c. to 75c. a ton.

Pig iron prices continue to stiffen in proportion to the improvement in furnace bookings. In the Valleys, foundry iron has risen 50c. and basic iron 25c. a ton; at Cleveland, foundry and malleable grades for local delivery have been marked up 50c. a ton.

The bulk of fourth quarter contracting for pig iron has been completed, but the week's commitments included several large purchases, among them 25,000 tons of basic bought in eastern Pennsylvania and 15,000 tons of the same grade placed at St. Louis.

Specifications for finished steel have been large. Sheet buyers have been particularly liberal in placing shipping orders, having the twofold purpose of taking advantage of third quarter prices and the present cash discount of 2 per cent, which will be reduced to one-half of 1 per cent Oct. 1.

Mill bookings are so large that shipments will necessarily carry over into the fourth quarter. In fact, price advances intended to rule on contracts for that period may not undergo a severe test until well toward the close of the year.

Specifying in bars, shapes and plates, although apparently not so heavy as in sheets, will undoubtedly extend deliveries of a considerable tonnage into the last quarter. The clause in the third quarter contracts of most mills stipulating that shipping orders be filed by Sept. 10 has been effective in driving in business, although seemingly it has failed to restrict the releases to third quarter needs.

Under the circumstances, buying at fourth quarter prices is deferred. However, it is now evident that steel producers do not intend to insist on a minimum price of 2c., Pittsburgh, or \$3 a ton above the ruling figure in third quarter contracts, but rather propose an advance of \$2 a ton for all classes of buyers. For the majority of consumers this will mean a price of 1.95c., Pittsburgh, while a few large buyers who have been getting steel at 1.80c. will be charged 1.90c. The maximum quotation of 2c. will apply to small or occasional buyers who have been paying 1.90c. during the current quarter.

Cold-finished strip steel is now generally commanding 2.75c., Pittsburgh or Cleveland. While this

is \$2 a ton short of what mills aimed at, it represents an advance of \$2 a ton over recently prevailing prices.

A single base price for all gages and widths of hot-rolled strip will probably be put into effect Oct. 1 by at least some producers.

The rate of steel production remains unchanged, with Chicago operations at slightly over 80 per cent and output in the greater Pittsburgh area between 80 and 85 per cent. The average of the various Steel Corporation subsidiaries continues at about 75 per cent.

Steel ingot production in August was the largest for any second-half month, totaling 4,178,481 tons, or 154,759 tons a day. In only two previous months later than May has output exceeded 4,000,000 tons—October, 1926, and October, 1918. Ingot output so far this year surpasses the previous eight-month record, in 1926, by 4 per cent.

A gain of 53,116 tons in the unfilled orders of the Steel Corporation in August brought the total to 3,624,043 tons, compared with 3,196,037 tons a year previous. This increase, together with heavy releases prior to Sept. 10 in sheets, bars, shapes and plates, points to the continuation of a high rate of output.

Among the major outlets for steel, the automobile industry is expected to curtail operations somewhat in October. On the other hand, the railroads will soon place fall orders for rails. The Canadian Pacific has bought 13,000 tons from the Algoma mill, and the Hocking Valley is in the market for 6500 tons. Early inquiries are expected from the Louisville & Nashville and the Pennsylvania.

A pipe line order of 50,000 tons was added to an already large tonnage of this class of steel recently put on mill books. The buyer was the Sinclair Pipe Line Co., which will extend a line from Oklahoma to Chicago. A Milwaukee fabricator of electrically welded pipe is about to place 110,000 tons of steel for a recent order for a gas line from Amarillo, Tex., to Omaha.

A New York City water tunnel, now up for bids, will take 20,000 tons of miscellaneous iron and steel products, of which 9325 tons is fabricated structural steel and 2850 tons is reinforcing bars.

Negotiations to regulate competition in export markets for tin plate in the interest of Welsh and American makers are reported from England by cable. Some semblance of a partitioning of markets is indicated, though the arrangements are probably not substantially different from those which have lately existed.

Registering the second rise since a low was reached in July, THE IRON AGE composite price for pig iron has advanced from \$17.34 to \$17.46 a ton. The finished steel composite remains for the sixth week at 2.348c. a lb.

Pittsburgh

Some Falling Off in Automobile Demand But Other Steel Specifications Are Heavy—Plates, Shapes and Bars Advanced \$2—Pig Iron Prices Higher

PITTSBURGH, Sept. 11.—Makers of steel dependent upon the automotive industry as an outlet for the major part of their production report business in the first 11 days of September to have fallen below that of the same period last month. In other respects, the steel market is fully as active as it has been lately and there has been little or no change in the rate of ingot production in this and nearby districts. Much business in bars, plates and shapes has been driven in by the insistence of makers on specifications on third quarter contracts by Sept. 10 and equal firmness in the matter of securing higher prices for fourth quarter contract tonnages.

Instead of an advance of \$3 a ton over the third quarter contract price, as had been proposed, steel companies generally seem to be asking only \$2 a ton above the price at which each buyer got the bulk of third quarter shipments. This means a range of 1.90c. to 2c., base, according to the importance of the buyer, instead of a minimum for all of 2c., base.

There has been some fourth quarter contracting, and it is said that the higher prices are meeting with very little resistance, much less, at any rate, than might be encountered if the advance was only \$1 a ton. It has been found that when the latter amount has been sought, buyers are disposed to resist on the theory that

it does not reflect real confidence on the part of producers.

Sheet business has continued to be stimulated by the desire of buyers to get in as much tonnage as the mills would take for delivery this month, in the effort to escape the lower discount for cash which becomes effective Oct. 1.

Tin plate business still is in its seasonal contraction and tin mill operations are slipping, but the demand for wire products shows a tendency to expand, as is usual at this time of the year.

The pipe producers, more especially those making seamless pipe, still are having a good business. Railroad demands continue to disappoint, but contracting for next year's rail requirements is expected to start up in the next 30 days.

The agricultural implement manufacturers have had an exceptionally active year, and, judging from the size of the demand for sheets from that source, a continuance of that condition is commonly expected.

Some sheet makers have on order as much tonnage for shipment over the remainder of this year as they have taken in full 12 months' periods in recent years.

The pig iron market is gaining in strength, and, while business is quiet, producers have enough business booked to be able to take a strong stand on prices.

Further advances in scrap have increased the recovery from the recent low point on heavy melting steel to \$3 a ton, sales of that grade having

been made at \$17. Not the least interesting feature in this market is the fact that compressed sheet scrap is commanding the same prices as heavy melting steel.

Pig Iron.—Business is only moderately active, but this condition is as much due to the firm price attitude of producers as any lack of interest on the part of melters. More business might be done in basic iron if makers were willing to sell at recent prices. Most producers now are quoting \$16.50, Valley furnace, for this grade and report having refused several thousand tons on which they were offered \$16; while no sales are noted at \$16.50, it is also evident that none of this grade is available at less than \$16.25. Bessemer iron has not been sold in the past week at less than \$17.25 and the more common asking price is \$17.50. All producers of foundry iron are quoting \$17, Valley furnace, for No. 2 grade and appear disinterested in more business at less. That price is supported by a fair number of small-lot sales. An advance of 25c. on malleable iron has found some basis in sales. A local sanitary ware company, with a plant at Louisville, has closed for the foundry iron requirements of that plant for the last quarter of the year; purchases are estimated at about 8000 tons, of which three-quarters will be furnished by southern Ohio furnaces. Birmingham iron was sold at \$16.25 for No. 2 grade, while that from southern Ohio was sold at a delivered price approximately 30c. per ton less than the Southern iron. The Pittsburgh-Valley market is showing real firmness, which in the case of foundry iron is due to the fact that most makers now have good-sized backlogs, while there is the additional factor of the firmness of the Lake front furnaces and the fact that they are not offering quite as stiff competition in competitive territory as they did recently.

Prices per gross ton, f.o.b. Valley furnace:

Basic	\$16.25 to \$16.50
Bessemer	17.25 to 17.50
Gray forge	16.50
No. 2 foundry.....	17.00
No. 3 foundry.....	16.50
Malleable	17.25
Low phos., copper free....	26.50

Freight rate to Pittsburgh or Cleveland district, \$1.76.

Ferroalloys.—Consumers continue

to take deliveries freely on contracts, but there is little spot business because so many users are covered by contracts. Prices are unchanged.

Semi-Finished Steel.—There is a continued good movement of billets, slabs and sheet bars on third quarter contracts, but little interest is being shown by non-integrated manufacturers in fourth quarter tonnages. The mills have indicated an intention of holding for an advance of \$1 a ton over the third quarter prices, on fourth quarter contracts, but buyers are hesitating about signing up in view of the fact that the recently announced advance in strips does not appear to be holding, while the higher fourth quarter prices on sheets have not yet been seriously tested. Wire rods are fairly active and steady at \$42, base, Pittsburgh.

Bars, Plates and Shapes.—An advance of \$2 a ton now seems to be the plan that some manufacturers will take in respect to prices for fourth quarter contracts. Buyers who contracted for this quarter at 1.90c., base, will be asked to pay 2c., base; while it is said a good many third quarter contracts carried 1.90c., base, it is admitted that the tonnage was small. The more common price was 1.85c., while some of the really large buyers have been drawing against 1.80c. contracts. The latter classes will also be asked to pay an advance of \$2 a ton and the market seems to be shaping for a range of 1.90c. to 2c., instead of a minimum of 2c., as suggested in the announcements which began to appear early in July. Buyers still are drawing heavily against existing commitments, insistence upon third quarter contract specifications by Sept. 10 having stimulated such releases. Some large users of hot-rolled bars have until Sept. 20 in which to place specifications on third quarter contracts, but in shapes and plates the earlier date has been more commonly observed.

Rails and Track Supplies.—The Chesapeake & Ohio Railroad has followed up its recent rail inquiry with one for its fourth quarter requirements of spikes. Otherwise the market for track fastenings is dull and the placing of standard-section rails

for late winter and early spring shipment is yet to get under way.

Wire Products.—Business continues to make a good showing in comparison with this time last year. Fall demands for barbed wire and fencing are expected to be fairly large this year and users of plain wire are ordering with a fair degree of freedom. Nails are moving steadily. Prices still show marked steadiness in all markets except those which ordinarily are irregular on account of the convergence of competition from several producing centers.

Tubular Goods.—Demand holds up well for seamless drill pipe and casing from California, and it is some time since there was as full engagement of productive capacity as at present. The National Tube Co. running at its Lorain, Ohio, plant on a seamless 10 in. oil pipe line to extend from Midland, Tex., to Port Arthur is reported to have produced in excess of 18,000 tons of this size on its No. 2 mill in one month. Lapwelded oil country pipe is dull and butt welded pipe for building and construction is yet to feel the stimulation of the fall heating demands.

Sheets.—The market still is active, as a result of the eagerness of consumers and distributors to get specifications in by Sept. 10, which most mills set as the deadline on third quarter contract tonnage releases on which buyers would be given a discount of 2 per cent for cash in 10 days. One large maker found it necessary to stop taking specifications on automobile body sheets on Sept. 3, because it could not possibly expect to make shipments before the end of the month, when the discount for cash in 10 days goes to one-half of 1 per cent. An interesting phase of the situation is the strong effort made by buyers, who hitherto have been keeping purchases to from two to four weeks' requirements, to contract for all of their fourth quarter needs. Some producers interpret this activity as due to the fact that buyers are expecting higher prices and want to be covered. The more general condition, however, is that mills have taken more business than they can ship in the remainder of this quarter

Carbon Vanadium	0.95	3.70

Above prices are for hot-rolled steel bars, forging quality. The ordinary differential for cold-drawn bars is 1c. per lb. higher. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis. For billets under 4 x 4 down to and including 2½ in. squares, the price is \$5 a gross ton above the 4 x 4 billet price.

Slabs with sectional area of 16 in. or over carry the billet price; slabs with sectional area of 12 in. to 16 in. carry a \$5 extra above the billet price and slabs with a sectional area under 12 in. carry the bar price.

Band sizes are 40c. per 100 lb. higher.

Rails

Per Gross Ton

Carbon, 0.30% to 0.40%, base.....	50
Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.	

and some makers doubt that there is much likelihood of getting prices up before the first quarter of 1929. Tin mill black plate is firmly held at 2.90c., base, but most of the business in sheets in general is at recent prices.

Tin Plate.—Demand for tin plate is steadily diminishing and mill operations are moving in the same direction. The American Sheet & Tin Plate Co. started this week with a full operation, but expects to take off some mills before the end of the week. Shipments for the year to date have been considerably heavier than in the same period last year and it will take a lean final quarter to wipe out the gain.

Cold-Finished Steel Bars and Shafting.—Business has shown some recession. Evidently, automobile parts makers are well supplied on their orders for this month and are not yet interested in their requirements beyond Oct. 1. Makers report some resistance to higher prices on the part of automobile builders, but there is no evidence of deviations from 2.20c., base, on tonnage to be shipped in the fourth quarter.

Hot-Rolled Flats.—There has been a slight letdown in the orders and specifications for strips. Production plans of automobile builders are not as heavy for October as for this month, and, since there is a lapse of about four weeks between the time the strips leave the mills and appear in automobiles, current orders reflect that fact. One maker of a low-priced car will wind up production on the present series about the middle of October and is taking steel merely in keeping with that plan. It is the hope of producers now that the proposed advance in price for the fourth quarter will be made effective on first quarter of 1929 business.

Cold-Rolled Strips.—Failure of the proposed advance in hot-rolled strips

to become generally effective has made it difficult for makers of cold-rolled strips to raise prices. While the regular quotation is 2.85c., base, the more common maximum is 2.75c., and large consumers are said to have been covered for the fourth quarter at the third quarter price.

Bolts, Nuts and Rivets.—Demand still is more notable for its steadiness than its size. There is no change in prices.

Coke and Coal.—Except for some increase in the demand for coal and coke for household heating purposes, conditions are much as they have been for the past few weeks. Slack coal continues very weak, owing to the fact that the supply is gaining as production of prepared sizes moves up with the demand for household coal. There is not much spot furnace coke, but not much is wanted, and prices hold where they were last week. Offerings of spot foundry coke are quite ample for all requirements, with prices unchanged.

Old Material.—Prices continue to work higher, with real strength showing in machine shop turnings, which have been sold in the past week at as high as \$12, and in blast furnace grades, which have climbed to \$13, these prices representing an advance of \$1.50 a ton from those of a week ago. Dealers still report that it is easier to sell than to buy heavy melting steel, and, because of the scarcity of that grade, compressed sheets, which rank with the heavy melting grade, are bringing the same price. It was believed that the Pennsylvania Railroad heavy melting steel would sell well above \$17; while some of it went to one point in the district at \$17.08 per gross ton, most of the lot sold at \$16.80 to \$16.90. These prices, however, were fully \$1 a ton over those realized on the August list.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:

Heavy melting steel.....	\$16.50 to \$17.00
Scrap rails	16.00 to 16.50
Compressed sheet steel.....	16.50 to 17.00
Bundled sheets, sides and ends	15.00 to 15.50
Cast iron carwheels.....	15.00 to 15.50
Sheet bar crops, ordinary.....	16.75 to 17.25
Heavy breakable cast.....	12.75 to 13.25
No. 2 railroad wrought.....	16.50 to 17.00
Heavy steel axle turnings.....	14.50 to 15.00
Machine shop turnings.....	11.50 to 12.00

Acid Open-Hearth Grades:

Railr. knuckles and couplers.....	17.50 to 18.00
Railr. coil and leaf springs.....	17.50 to 18.00
Rolled steel wheels.....	17.50 to 18.00
Low phos. billet and bloom ends	20.00 to 20.50
Low phos., mill plates.....	18.50 to 19.00
Low phos., light grade.....	17.50 to 18.00
Low phos., sheet bar crops.....	18.50 to 19.00
Hvy. steel axle turnings.....	14.50 to 15.00

Electric Furnace Grades:

Low phos. punchings.....	17.50 to 18.00
Hvy. steel axle turnings.....	14.50 to 15.00

Blast Furnace Grades:

Short shoveling steel turnings	12.50 to 13.00
Short mixed borings and turnings	12.50 to 13.00
Cast iron borings.....	12.50 to 13.00

Rolling Mill Grades:

Steel car axles	18.50 to 19.00
No. 1 railroad wrought.....	12.50 to 13.00
Sheet bar crops.....	16.50 to 17.00

Cupola Grades:

No. 1 cast.....	15.00 to 15.50
Rails 3 ft. and under.....	16.50 to 17.00

Steel Corporation's Orders Increase in August

An increase in unfilled orders on the books of the United States Steel Corporation was recorded in August. The total on Aug. 31 was 3,624,043 tons, compared with 3,570,927 tons on July 31—an increase of 53,116 tons. In July there was a decrease from June of 66,082 tons. A year ago, on Aug. 31, the unfilled orders were 3,196,037 tons. The table gives the reported figures for the last 20 months.

		1928	1927
Jan.	31.....	4,275,947	3,800,177
Feb.	28.....	4,398,189	3,597,119
Mar.	31.....	4,335,206	3,553,140
April	30.....	3,872,133	3,456,132
May	31.....	3,416,822	3,050,941
June	30.....	3,637,009	3,053,246
July	31.....	3,570,927	3,142,014
Aug.	31.....	3,624,043	3,196,037
Sept.	30.....		3,143,113
Oct.	31.....		3,341,040
Nov.	30.....		3,454,444
Dec.	31.....		3,972,874

At the end of April, 1917, the highest total in unfilled orders of the Steel Corporation ever attained was reported at 12,183,193 tons. The lowest figure ever reported was 2,754,757 tons, Dec. 31, 1910.

20,000 Tons of Steel in New York Water Tunnel

The New York Board of Water Supply will receive bids on Sept. 25 on 20,523 tons of iron and steel which will be required for a water tunnel extending from Yonkers, N. Y., to Brooklyn. The project, which will be let in four sections, will require five years for completion. According to official estimates, the steel requirements will be as follows: 2950 tons of structural steel shapes; 2750 tons of steel roof supports; 3625 tons of interlocking steel plates; 2850 tons of reinforcing bars; 3490 tons of sheet steel piling; 117 tons of gratings, ladders, doors and frames; 768 tons of miscellaneous cast iron, wrought iron and steel; 213 tons of cast steel pipe and fittings; 170 tons of cast iron pipe and fittings; 190 tons of steel pipe conduits; 50 tons of galvanized steel sheets, and 3350 tons of valves and fittings, the last item to be purchased directly by the city.

L. C. L. Freight Rate to Virginia and Maryland Increased

WASHINGTON, Sept. 11.—In a decision made public yesterday the Interstate Commerce Commission found justified the proposed tariff of the Pennsylvania Railroad to increase the rate on iron and steel articles, in less than carloads, from Pittsburgh and certain points in Pennsylvania eastward to Norfolk, Va., and points in Virginia and Maryland on the Delaware-Maryland-Virginia peninsula. The new schedule, effective Sept. 18, increases the present fourth class rate of 47.5c. per 100-lb., to 48c.

Upset set screws.....	80, 10 and 10
Milled studs	70 and 5

Chicago

Steel Producers Announce 2.10c. as Price on Plates, Shapes and Bars—Backlogs Have Increased

CHICAGO, Sept. 11.—Chicago producers of plates, shapes and bars have named 2.10c. per lb. as the price effective from Sept. 10. Backlogs have grown measurably in recent weeks and deliveries have been extended to the range of three to five weeks and so forecast shipments of lower priced steel after the opening of the final quarter. Prices that previously had been named to fabricators on special jobs are being held open to Sept. 15, but it remains to be seen what tangible results will come from this favor because of the general tightening of loans for building construction. Spot purchases of finished steel are less numerous and orders for delivery after Oct. 1 are so few and small that there is little or no gage by which to judge the strength of the new quotations. Taken as a whole, sales compare favorably with the average week so far this year. A fair sprinkling of miscellaneous rail orders is holding rail output at 50 per cent of capacity, while ingot production is a shade above 80 per cent of practical mill rating.

September shipping schedules for manufacturers of automobiles are larger for the industry as a whole, and farm implement plants are not only holding to a high rate of output but are now studying steel requirements for the manufacture of tillage machinery for spring delivery.

No. 8 furnace at South Chicago has been blown out for relining. The leading producer now has 14 stacks in blast and one is banked for the district as a whole, 23 of 36 furnaces are in use. A merchant pig iron stack has been added to the active list.

The Sinclair Pipe Line Co. has placed 50,000 tons of steel pipe, half with the National Tube Co. and the remainder divided between the Jones & Laughlin Steel Corporation and the Bethlehem Steel Co., for increasing the capacity of an oil trunk line from Oklahoma to Chicago.

Ferroalloys.—Ferromanganese is reported stronger at \$105, seaboard. Specifications for spiegeleisen are heavier but sales are light at \$32 to \$33, Hazard, Pa., for the 19 to 21 per cent grade. Release orders against ferrosilicon contracts are more numerous.

Prices delivered Chicago: 80 per cent ferromanganese, \$112.56; 50 per cent ferrosilicon, \$83.50 to \$87.50; spiegeleisen, 19 to 21 per cent, \$40.76.

Pig Iron.—A Federal furnace was lighted Sept. 13, thus bringing into use the full capacity of merchant stacks in the immediate vicinity of Chicago. Prices are strong at \$18 a ton, local furnace, for No. 2 iron. Several sizable contracts for fourth quarter delivery have been closed, but buying is mostly confined to spot purchases. The strength of the market, expanding shipments and low furnace stocks discount statements that buying in recent weeks was on a speculative basis. It is admitted by sellers that a few users may have overbought, but some observers believe that buyers are still cautious and that even a continuation of the present rate of melt will bring a large fill-in tonnage into the market before the end of the year. Silvery sales are active, with prices generally maintained except on the higher silicon grades. Curtailment of output may

strengthen quotations. A few scattered sales of charcoal iron are reported.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25	\$18.00
N'th'n No. 1 fdy., sil. 2.25 to 2.75	18.50
Malleable, not over 2.25 sil.	18.00
High phosphorus	18.00
Lake Super. charcoal, sil. 1.50	27.04
So'th'n No. 2 fdy. (all rail)	22.26
So'th'n No. 2 (barge and rail)	21.76
Low phos., sil. 1 to 2, copper free	\$28.50 to 29.00
Silvery, sil. 8 per cent.	29.79
Bess. ferrosilicon, 14-15%	46.79

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Plates.—A Western manufacturer of electrically welded steel pipe is negotiating for about 110,000 tons of plates needed for a 24-in. gas line, which will extend from Amarillo, Tex., to Omaha, Neb. The Sinclair Pipe Line Co., a joint subsidiary of the Sinclair Consolidated Oil Corporation and the Standard Oil Co. of Indiana, has ordered 50,000 tons of 8, 10 and 12-in. lapweld pipe for a line to extend from Oklahoma to Chicago. The business was divided among the National Tube Co., Bethlehem Steel Co. and Jones & Laughlin Steel Corporation. Miscellaneous oil tank orders for the Chicago territory have added 2500 tons to plate makers' books. Plate mills in this district are busy; notwithstanding that car shops are operating at a low rate and that fabricators are making greater use of special shapes, thus eliminating many narrow plates. Demand is sustained from the oil industry, which has found large needs for welded pipe and for added oil storage facilities. Steel orders for tank construction this year are running fully 50 per cent heavier than in 1926, which was considered a good year. Sept. 10 was the closing date on specifications against purchases at third quarter prices, and sellers are now asking 2.10c. per lb., Chicago. With deliveries averaging three weeks or more, it is evident that shipments against 2c. purchases will be carried beyond Sept. 30. The Great Northern has ordered 500 flat cars from the Standard Steel Car Co. and will build 500 box cars and 2000 un-

derframes in its shops at Superior, Wis. The bulk of the 21,000 tons of steel needed for this equipment will be rolled by Western mills.

Mill prices on plates, per lb.: 2c. to 2.10c. base Chicago.

Bars.—Deliveries of soft steel bars are extending. Several automobile manufacturers, whose production of new models is under way, are expanding operations, bringing the general demand for steel from that source to a slightly higher level than in the previous week. Ford output is creeping up, though one of its competitors is taking less steel while models are being changed. Tractor plants are operating full and farm implement manufacturers are now preparing to produce tillage machinery that will be needed for spring delivery. Mills are asking 2.10c. per lb., Chicago, for soft steel bars. Sales, however, are not affording real tests of the higher quotations. Fourth quarter contracting for alloy steel bars is under way at the advance of \$2 a ton. Specifications are steady and output has been increased to 90 per cent of capacity. Demand for rail steel bars is unchanged; both local mills are operating double turn.

Mill prices per lb.: Soft steel bars, 2c. to 2.10c., base, Chicago; common bar iron, 2c., base, Chicago; rail steel bars, 1.85c., base, Chicago Heights mill.

Structural Material.—Producers are asking 2.10c. per lb., though protection is being extended to Sept. 15 to fabricators who have quoted on special jobs. Sales at the new prices are not numerous and the market needs further tests.

Mill prices on plain material, per lb.: 2c. to 2.10c. base, Chicago.

Sheets.—Because of warm weather, output in the past week has not gone above 80 per cent of hot mill capacity. Producers have tonnage on their books to warrant full operation of all units. Prices are firm, though current sales are not heavy and shipments are largely against old obligations. Fourth quarter contracting is moving slowly, and it is noticeable that individual commitments for the final period are smaller than in the third quarter, lending weight to the general impression that heavy specifications now foretell building up of stocks against a part of buyers' fourth quarter requirements. Users are issuing liberal specifications, and deliveries have lengthened to three to five weeks for all finishes. Old obligations that have been drawn against heavily in the past few weeks are dwindling. Third quarter contracts probably will be taken out in full. Though little resistance to new prices is offered, buyers generally are objecting strenuously to the lower discount for cash.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 2.80c. to 2.90c.; No. 24 galv., 3.65c. to 3.75c.; No. 10 blue ann'd, 2.15c. to 2.25c. Deliv'd prices at other Western points are equal to the freight from Gary plus the mill prices, which are 5c. per 100 lb. lower than Chicago delivered prices.

Cast Iron Pipe.—Two lettings of moderate size have given a little life to this market, which has been unusually dull for several weeks. The State of Illinois has ordered 700 tons of 10 to 16-in. pipe for delivery at Joliet, Ill. The American Cast Iron Pipe Co. was given the order for 10 and 12-in. pipe and the United States Cast Iron Pipe & Foundry Co. was awarded the larger sizes. James B. Clow & Sons have been awarded 7000 ft. of 6-in. and 2000 ft. of 8-in. centrifugal cast pipe for Appleton, Wis. Among fresh inquiries is 500 tons of 20-in. pipe for Portsmouth, Ohio. Milwaukee will buy 825 tons of 42-in. pipe and 34 tons of special fittings. A few contractors are still busy and have work ahead well up to early winter. Many of them are seeking small contracts to fill out the next two or three months of pipe laying weather. Prices are firm at \$34 to \$35, Birmingham, for diameters 6 in. and larger.

Prices per net ton, deliv'd Chicago: Water pipe, 6-in. and over, \$42.20 to \$43.20; 4-in., \$46.20 to \$47.20; Class A and gas pipe, \$4 extra.

Hot-Rolled Strip.—Western producers are ready to accept fourth quarter contracts for this commodity at 2c. to 2.30c. per lb., Chicago. Current specifications are large from practically all classes of users. Forward buying is light.

Reinforcing Bars.—Although close to 1300 tons of rail steel reinforcing bars was placed in the past week, there is a growing impression that various conditions are holding building operations in check. Loans for building projects are more difficult to obtain and there are some who attribute quieter business to the approaching presidential election. Fresh inquiry is much lighter in both small and large jobs, and several heavy tonnage projects have been temporarily shelved. Shop operations, under the impetus of a uniform flow of business in the late summer months, remain steady. Prices lean toward weakness. Recent contracts and fresh inquiry are shown on page 676.

Warehouse Prices, f.o.b. Chicago

Base per Lb.

Old Material.—Prices for practically all grades are nominal. Dealers are paying higher prices and railroads are making sales at figures well above recent levels. Steel plants, having reduced the use of pig iron, are more interested in scrap, and rejected cars, instead of being turned away, are being taken in at a cut in price. Manufacturers' scrap is more plentiful, and railroad lists, including 5000 tons offered by the Santa Fe and 6000 tons by the Illinois Central, are numerous.

Prices deliv'd Chicago district consumers:

Per Gross Ton	
Basic Open-Hearth Grades:	
Heavy melting steel.....	\$13.00 to \$13.50
Shoveling steel.....	13.00 to 13.50
Frogs, switches and guards, cut apart, and misc. rails	14.75 to 15.25

Grate bars.....	12.00 to 12.50
Brake shoes.....	10.25 to 10.75

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Wire Products.—Specifications from the manufacturing trade show variation from last week, and it is thought by some that requirements are lighter. A check on demand from the automobile trade, one of the most active users, indicates that as a whole there is no slackening in the rate of deliveries. Fourth quarter contracting is being done at a satisfactory rate, but it will be a week or 10 days before it will reach a peak. Orders from jobbers are numerous, but are usually of small size. An increased demand for woven wire fencing is noticed in the South, following the announcement of spring terms on that commodity. Prices are steady. Output at 65 per cent of wire mill

capacity is slightly higher than the current rate of shipments, as producers attempt to expand stocks against the fall demand which is expected to develop soon. Prices for wire products are given on page 659.

Rails and Track Supplies.—Miscellaneous standard-section rail orders in the week totaled 16,000 tons. These orders, added to those placed in recent weeks, bring the aggregate for immediate rolling to 23,000 tons. The bulk of this tonnage has been promised for delivery in 30 days, and local rail mills, though having, practically completed former obligations, are holding operations at 50 per cent of capacity. The 45,500 tons needed by the Chesapeake & Ohio is still before producers. Fresh inquiry this week is for 6500 tons for the Hocking Valley. Over 4000 tons of track accessories have been specified in the week. Further evidence is at hand that the fall rail buying movement will soon get under way. Demand for light rails is small and shipments are confined almost wholly to carloads.

Prices f.o.b. mill, per gross ton: Standard-section open-hearth and Bess. rails, \$43; light rails, rolled from billets, \$36. Per lb.: Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.15c.; angle bars, 2.75c.

Bolts, Nuts and Rivets.—Purchasers are being offered fourth quarter contracts at unchanged prices. Specifications are steady and the industry continues to produce at between 60 and 65 per cent of capacity.

Coke.—Shipments of by-product foundry coke are growing heavier as the foundry melt expands. Producers are drawing on stocks to meet shipping instructions. Prices are firm at \$8 a ton, f.o.b. local ovens.

Railroad Equipment

Great Northern Orders 1000 Cars and 2000 Underframes

THE Great Northern's orders for 1000 freight cars, divided equally between an outside maker and its own shops, and 2000 underframes to be built in its own shops were the feature of the week's car business. The Canadian National is inquiring for 55 locomotives and the Denver & Rio Grande Western for 10 to 15. Details of the week's business follow:

Great Northern has ordered 500 flat cars from Standard Steel Car Co. and will build 500 box cars and 2000 underframes in its Superior, Wis., shops.

Chicago, Indiana & Louisville will build 100 box cars in its own shops.

Republic Iron & Steel Co. has ordered repairs to four air-dump cars from Clark Car Co.

Canadian National is inquiring for 55 locomotives.

Bangor & Aroostook has ordered one Mogul type locomotive from American Locomotive Co.

Central of Porto Rico has ordered one Mogul type locomotive from Baldwin Locomotive Works.

Denver & Rio Grande Western is asking bids on 10 to 15 locomotives.

Philadelphia

Steel Company Buys 15,000 Tons of Basic Pig Iron—Heavy Steel Scrap Sold at Higher Prices

PHILADELPHIA, Sept. 11.—Consumers are continuing to issue heavy specifications against current contracts, but except for some sheet contracting, with full specifications for delivery before Oct. 1, not much interest in fourth quarter has been exhibited by steel users. Bar and plate mills are well filled with tonnage and are approaching the period of last quarter contracting with confidence that prices will be maintained at 1.90c. to 2c., Pittsburgh, on bars and 2.05c. to 2.15c., Coatesville, on plates. Sheet mills also have fair backlogs, which have placed them in a more independent position than in many months. Users have specified freely against third quarter contracts and have in many cases anticipated at least part of their last quarter sheet requirements to obtain the 2 per cent discount for cash, which terminates Oct. 1.

Since the recent flurry of buying in foundry pig iron for fourth quarter delivery at \$19.50 per ton, base, which culminated in an advance by furnaces in this district to \$20, base, the market has become quieter. Iron and steel scrap continues strong and consumers in eastern Pennsylvania are beginning to seek new contracts at the higher levels established by dealer buying in the past fortnight.

Pig Iron.—Consumers of foundry iron have apparently covered their requirements for at least part of the next quarter at the former quotation of \$19.50 per ton, base, so that \$20 per ton, the present quotation, is untested except on occasional carload lots for prompt shipment. Most sellers still have some \$19.50 per ton offers outstanding, of which buyers are expected to take advantage in the next few days. The purchase last week of about 25,000 tons of basic iron by a Coatesville consumer has completed coverage of eastern Pennsylvania users of this grade for the next few months. Recent buying of basic was at a range of \$18.75 to \$19.25 per ton, delivered, but makers are now quoting \$19 to \$19.50 per ton, which is not likely to be subjected to an early test.

Prices, per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.	\$20.26 to \$20.76
East Pa. No. 2X, 2.25 to 2.75 sil.	20.76 to 21.26
East. Pa. No. 1X.....	21.26 to 21.76
Basic (del'd east. Pa.)...	18.75 to 19.25
Gray forge	19.75 to 20.25
Malleable	21.00 to 21.50
Stand. low phos. (f.o.b. N. Y. State furnace)...	22.00 to 23.00
Cop. b'rg low phos. (f.o.b. furnace)	23.00 to 23.50
Va. No. 2 plain, 1.75 to 2.25 sil.	24.54
Va. No. 2X, 2.25 to 2.75 sil.	25.04

Prices, except as specified otherwise, are delivered Philadelphia. Freight rates; 76c. to \$1.64 from eastern Pennsylvania furnaces; \$4.54 from Virginia furnaces.

Bars.—Mills are well booked with tonnage specified on present contracts, but orders for prompt shipment are few and buyers have not expressed much interest in their last quarter requirements. Within the next week or 10 days a development of fourth quarter inquiry is expected, and with mills in a good position, prices are expected to be from 1.90c. to 2c., Pittsburgh, or 2.22c. to 2.32c., delivered Philadelphia.

Shapes.—Less than 1.95c. per lb., Pencoyd, Pa., or 2.01c., Philadelphia, on shapes has about disappeared, but an advance to 1.90c., Pittsburgh, or 2.05c., Bethlehem, is not considered

likely for the present, as mills are in most cases quoting from 1.95c. to 2.05c., Pencoyd, or 2.01c. to 2.11c., delivered Philadelphia. Large fabricators are booked with tonnage to carry them to the end of the year and fabricated steel prices on sizable projects are reported slightly stronger on recent bidding.

Plates.—Mills are well filled with specifications for delivery on current contracts, in addition to which some sizable tonnages of plates have recently been booked from large buyers. Interest in fourth quarter contracting has not yet developed, but 2.05c. to 2.15c., Coatesville, or 2.15c. to 2.25c., delivered Philadelphia, is generally considered by mills as the probable range of quotations.

†For 50 bundles or more; 10 to 49 bun., 4.95c. base; 1 to 9 bun., 5.30c. base.

Sheets.—Recent buying, on which specifications for September delivery have been given, has been fairly active, and with some consumers already covered at the present prices on part of their last quarter requirements, a smaller tonnage is generally expected on contracts for fourth quarter shipment. Galvanized sheets are quoted at 3.50c. to 3.60c. per lb., Pittsburgh, but 3.40c. per lb. has not entirely disap-

peared. Black sheets seem to be quite firm at 2.75c., per lb., Pittsburgh. Blue annealed prices range from 2c., base Pittsburgh, on widths up to 45 in., to 2.10c., base, on wider than 45 in.

Warehouse Business.—Jobbers in this district have advanced structural shapes and plates to a minimum of 2.60c. per lb., base, and have included them in the quantity differential applied for several months to bars and bar-size shapes.

Imports.—In the week ended Sept. 8, 3763 tons of chrome ore arrived at this port from Cuba. Steel imports consisted of 182 tons of bars, of which 93 tons was from Sweden, 45 tons from France and 44 tons from Belgium. Other arrivals from Belgium were 44 tons of structural shapes and 10 tons of bands. Steel billets totaling 56 tons came from Sweden and 32 tons of steel scrap from Germany.

Old Material.—A purchase of a few thousand tons of heavy melting steel by a nearby steel plant at \$15 represents a full \$2 a ton advance in this market. Although the nominally quoted price of \$13 has not been tested in many weeks by transactions, the continually increasing strength in other markets, particularly Pittsburgh, has made it necessary for brokers to advance their quotations. On the Pennsylvania Railroad list \$16.85 and \$17.10 per ton, delivered to mills in the Pittsburgh district, is reported to have been bid on the heavy melting steel. Heavy breakable cast has been bought at \$16 and stove plate at \$12 per ton by a Harrisburg consumer, and a Phoenixville mill has paid \$11.50 per ton for machine shop turnings, an advance of 75c. per ton from its previous price. Specification pipe has registered a rapid upward trend on recent sales to consumers, who have paid \$14, \$14.50 and \$15 per ton, delivered. Nearly all grades of scrap show advances of 50c. to \$1 a ton and sellers express the opinion that an eastern Pennsylvania mill buying No. 1 heavy melting steel today would find it necessary to pay close to \$16 a ton to secure more than a limited tonnage.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel.....	\$15.00
Scrap T rails.....	\$14.00 to 14.50
No. 2 heavy melting steel.....	11.00 to 12.00
No. 1 railroad wrought.....	14.00 to 15.00
Bundled sheets (for steel works)	10.50 to 11.00
Machine shop turnings (for steel works)	11.00 to 11.50
Heavy axle turnings (or equiv.)	12.00 to 13.00
Cast borings (for steel works and roll. mill)...	11.00

Steel rails for rolling....	15.00 to 15.50

New York

Plates, Shapes and Bars Advanced \$2 for Fourth Quarter— Pig Iron Market Still Active

NEW YORK, Sept. 11.—Pig iron bookings by local selling offices totaled 12,000 tons. The flow of business is still in good volume, although most of the larger buyers are now covered for the fourth quarter. The Central Foundry Co. has closed against its inquiry for 6000 tons for its Dundalk, Md., plant, having bought some foreign iron in addition to tonnage from the New England stack and another Northern producer. Other orders recently placed include 4000 tons for the Richardson & Boynton Co., New York, and 1500 tons for the Burnham Boiler Corporation, Irvington, N. Y. Pending inquiries include one from a consumer in this territory for 4000 tons and another for 1500 tons for shipment outside this district. Numerous small lots are before the trade, possibly totaling 2000 tons. Prices show increasing strength. Some sellers are holding to a minimum of \$17, base Buffalo, on foundry iron, and an increasing number of orders are being taken on that basis, but quotations 50c. lower have not entirely disappeared. Eastern Pennsylvania foundry iron ranges from \$19.50 to \$20, base furnace. The peak of the wheat movement on the State barge canal has passed, and from now on water shipments of pig iron are expected to gain. Foundry melt continues to increase. Shipping instructions for pig iron are heavier, and specifications for foundry coke, a commodity which is not stocked to any extent, have shown a steady gain since the middle of August.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	\$21.41 to \$21.91
*Buf. No. 2, del'd east N. J.	19.78 to 20.28
No. 2, del'd east. N. J. tidewater	19.51 to 20.01
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	20.39 to 21.52
East. Pa. No. 2X fdy., sil. 2.25 to 2.75	20.89 to 22.02
East. Pa. No. 1X fdy., sil. 2.75 to 3.25	21.39 to 22.52

Freight rates: \$4.91 from Buffalo, \$1.39 to \$2.52 from eastern Pennsylvania.

*Price delivered to New Jersey cities having rate of \$3.28 a ton from Buffalo.

Ferroalloys.—New business in ferromanganese is confined to carload and small lots, mostly for early delivery, at \$105, seaboard basis. Specifications with most consumers covered by contract for the remainder of the year, are very heavy. Sales of spiegeleisen are fairly numerous in carload and small lots and there has been some business done in the imported alloy. Quotations are very firm at \$33, furnace, for the 19 to 21 per cent grade, and \$32 for the other.

Plates, Shapes and Bars.—The attitude of steel producers on fourth quarter prices has been clarified within the past week. Instead of an advance to 2c. for all buyers there will be a \$2 a ton rise for all buyers above the prices which applied on their

third quarter contracts. This will make the minimum 1.90c., Pittsburgh, for large buyers, many of whom have been getting their steel through this quarter at 1.80c. The majority of users, however, have paid 1.85c., while small or occasional buyers have been

charged 1.90c. Thus, the fourth quarter range, if the advances become effective, will be 1.90c. to 2c. Eastern plate and shape mills have regarded the third quarter price as 2c. at Eastern mill basing points, though some large buyers have been protected at less. The probable range on these products is 2.05c. to 2.15c., Coatesville, on plates and the same at Bethlehem on shapes. A week of fairly heavy specifications has resulted from the insistence of some mills that consumers specify their third quarter tonnages in full by Sept. 10. The mills which had this clause in their contracts report a very general observance of the stipulation, but other mills which did not make this provision have received smaller specifications in the first 10 or 11 days of September than the average for August. It is certain, however, that practically all mills will insert such a clause in their fourth quarter contracts, calling for complete specifications by Dec. 10. For delivery over the rest of this month, plates and shapes are available at the prices which have recently been in effect. Structural steel lettings in the metropolitan district in August for buildings (and exclusive of subways, bridges, etc.) totaled 43,350 tons, the Structural Steel Board of Trade reports. The July total was nearly 71,000 tons, while in August, last year, 32,000 tons was put under contract. Awards of the week included 8100 tons for a garment building in New York, 3000 tons for an apartment building in Tudor City and 2500 tons for a plant addition for the Western Electric Co., Kearny, N. J. The Board of Water Supply, New York, will take bids until Sept. 25 on about 20,000 tons of steel fabricated material for a water tunnel to extend from Yonkers to Brooklyn. The railroad equipment market is quiet except for an inquiry for 55 locomotives from the Canadian National Railways.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.19c. to 2.24c.; plates, 2.17½c. to 2.22½c.; struc. shapes, 2.14½c. to 2.19½c.; bar iron, 2.14c.

Reinforcing Bars.—In line with the fourth quarter advance in merchant bar prices, reinforcing bars will be advanced \$2 a ton on Sept. 15, although consumers will be given until Oct. 1 to take advantage of prices on business outstanding. On the new basis the price will be 2c., Pittsburgh, for 40, 50 and 60-ft. lengths which are available for direct mill shipment, while 2.25c., Pittsburgh mill warehouse, or 2.59c. on cars at New York, will be quoted on cut lengths. This practice of no longer quoting the mill price on cut lengths, which was adopted by distributors in this territory on Aug. 1, is designed to divert to the distributors small tonnages formerly shipped directly from the mills, and is being generally adhered to. New York warehouse prices are not being changed at present. Approximately 2850 tons of bars will be required for a water tunnel extending from Yonkers to Brooklyn, for which bids will be taken by the Board of

Water Supply, New York, on Sept. 25. The Packard garage and service station in Manhattan will take 1000 tons, and Government barracks on Governor's Island, 500 to 600 tons. Bars for a walk at Rockaway Beach, N. Y., calling for 350 tons, are reported to have been placed with E. T. Edwards, Columbia, Pa.

Pipe.—The Sinclair Pipe Line Co., New York, has divided an order for 50,000 tons of 8, 10 and 12-in. lap-welded pipe among the National Tube Co., the Bethlehem Steel Co. and the Jones & Laughlin Steel Corporation. The pipe is to be used for a line from Oklahoma to Chicago.

Sheets and Strip Steel.—Fairly heavy specifications for sheets against third quarter contracts have been received within the past week by mills whose contracts contained a clause requiring customers to specify not later than Sept. 10. This also was the last opportunity for buyers to take advantage of the 2 per cent discount for cash, which will not be effective after Oct. 1. Most of the sheet mills now have sufficient bookings to insure continuous rollings at high capacity for the remainder of this month and well into next month. Meanwhile, fourth quarter contracting is not of much interest to consumers and probably will not be until they get toward the end of their present commitments.

Warehouse Business.—Buying is at about the same rate as during August and except for concessions on black and galvanized sheets, quotations are well maintained. Galvanized sheets are in active demand, and most of the price shading seems to be in the metropolitan district, where concessions from 4.50c. per lb., base, are offered on desirable business. Black sheets are occasionally shaded from 3.80c. per lb., base, but demand is small. In local New Jersey 4c., base, for black and 4.70c., base, for galvanized are fairly well maintained.

Cast Iron Pipe.—The price situation is substantially unchanged, with Southern makers of pressure pipe quoting \$34 to \$35 per ton, Birmingham, which is occasionally shaded in this district to supply small additional needs of customers, and Northern foundries quoting from \$35.60 to \$37.60 per net ton, New York. Most of the current orders for pipe are small, but the aggregate is fair. Contractors' bids asked by the Department of Water Supply, Gas and Electricity, New York, involving about 2000 tons of pipe, brought out low bids by Michael De Stefano, St. George, Staten Island, and the Riverdale Water Works Corporation, New York. Included in a tunnel from Yonkers, N. Y., to Brooklyn, bids on which are to be opened Sept. 25, are 170 tons of cast iron pipe and 3350 tons of valves and fittings.

Prices per net ton, deliv'd New York:
Water pipe, 6-in. and larger, \$35.60 to \$37.60; 4-in. and 5-in., \$40.60 to \$42.60; 3-in., \$50.60 to \$52.60; Class A and gas pipe, \$4 to \$5 extra.

Coke.—Deliveries of by-product foundry coke are more protracted, with practically all ovens heavily

booked with tonnage for delivery until the end of the year. Connellsville coke prices are firm, but unchanged at \$2.75 to \$3 per ton, Connellsville, for standard furnace and about \$3.75 per ton for standard foundry. Special brands of foundry coke are \$4.85 per net ton, ovens, and delivered prices are \$8.56 per net ton, to northern New Jersey, Jersey City and Newark, and \$9.44 to New York and Brooklyn. By-product foundry coke prices are \$9 to \$9.40, Newark or Jersey City, and \$10.06, New York or Brooklyn.

Old Material.—Eastern Pennsylvania consumers of scrap are beginning to buy at the higher prices established recently by dealer and broker activity in filling old contracts, and the market is advancing rapidly. No. 1 heavy melting steel has been bought by a Claymont, Del., consumer at \$14.75 and \$15 per ton, delivered, and brokers are paying as much as \$14.75 per ton, delivered, to fill these orders. Brokers buying for shipment to western Pennsylvania are paying as much as \$11.25 per ton, New York, or with a \$5.30 freight rate, \$16.55 per ton, delivered. Bids for the heavy melting steel on the Pennsylvania Railroad list are reported as \$16.85 and \$17.10 per ton, delivered to western Pennsylvania mills. Stove plate has been bought by a Harrisburg user at \$12 and

brokers are paying as much as \$12.50 per ton on this delivery. Heavy breakable cast has advanced on a recent sale to \$16 per ton, delivered eastern Pennsylvania, and machine shop turnings have been bought by brokers, at \$11.50 per ton, delivered Phoenixville, Pa., on an order at the same price. All other grades show corresponding advances of 50c. to \$1 a ton, based on buying prices of brokers and new purchases by consumers.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel	\$10.75 to \$11.25
Heavy melting steel (yard)	7.25 to 8.00
No. 1 hvy. breakable cast	11.75 to 12.50
Stove plate (steel works)	8.25 to 8.75
Locomotive grate bars	8.25 to 8.75
Machine shop turnings	7.00 to 7.50
Short shoveling turnings	7.00 to 7.50
Cast borings (blast furn. or steel works)	6.50 to 7.50
Mixed borings and turnings	6.00 to 6.50
Steel car axles	16.75 to 17.25
Iron car axles	24.75 to 25.75
Iron and steel pipe (1 in. dia., not under 2 ft. long)	10.25 to 10.75
Forge fire	7.25 to 7.75
No. 1 railroad wrought	10.50 to 11.00
No. 1 yard wrot, long	8.50 to 9.00
Rails for rolling	11.00 to 11.50
Cast iron carwheels	13.00 to 13.50
Stove plate (foundry)	8.75 to 9.25
Malleable cast (railroad)	10.00
Cast borings (chemical)	11.25

Prices per gross ton, deliv'd local foundries:

No. 1 machy. cast	\$16.00 to \$16.50
No. 1 hvy. cast (columns, bldg. materials, etc.)	
cupola size	14.00 to 14.50
No. 2 cast (radiators, cast boilers, etc.)	13.50 to 14.00

Cleveland

Heavy Specifications on Third Quarter Contracts For Plates, Shapes, Bars and Sheets—Pig Iron Advanced

CLEVELAND, Sept. 11.—Heavy specifications came out during the week for steel bars, structural material and plates against contracts that required specifications to be in by Sept. 10. Some of the mills had set Sept. 15 as the last day for accepting specifications. While in certain cases mills have granted a little more time because of resistance of buyers, the plan of fixing a deadline for specifications so that consumers cannot rush in during the last days of the month is generally meeting with success and apparently little tonnage will remain unspecified after this week. The higher prices quoted for the last quarter materially help to bring out specifications against expiring contracts. Because of the forcing out of specifications, many consumers for a time will carry larger stocks than they have recently.

While a few fourth quarter contracts have been taken, the price advance has not yet been given much of a test. However, the market has a firm tone, and steel bars, structural material and plates evidently will become established at \$2 a ton higher than the prices that prevailed during the present quarter, which means a range of 1.90c. to 2c., Pittsburgh.

Some of the outside mills that are using Cleveland as a basing point for steel bars, with a 5c. per 100 lb. differential over the Pittsburgh base, are quoting bars at 1.95c. to 2.05c., Cleveland, for the last quarter and are asking the same prices for current orders. A local mill which has been on a 1.85c., Cleveland, base for steel bars has not yet announced its last quarter price. Plates are still available at 1.85c., Pittsburgh. This product is being quoted by one Ohio mill at 1.95c., Pittsburgh, for last quarter on round lots.

The demand for steel from the automotive industry, including the Cleveland parts makers, continues heavy, and one large car builder has increased shipping orders.

Structural lettings during the week included 4000 tons for a building for the B. F. Goodrich Co., Akron, the steel for which will be divided equally between the Carnegie Steel Co. and the Bethlehem Steel Co.

Pig Iron.—Cleveland furnaces today advanced foundry and malleable iron for local delivery 50c. a ton to \$18, furnace, and expect shortly to make a similar advance to \$17.50 for outside shipment. The market still shows considerable activity, although buying further declined in the past week. Cleveland interests sold 33,000 tons during the week, but less than 3000 of this was taken by furnaces located in Cleveland. Consumers in this territory are mostly covered. One local producer is virtually out of the mar-

ket and another is showing less disposition than recently to take business in outlying competitive points. Furnaces in this district are now adhering to full silicon differentials. Buf-falo furnaces which recently advanced foundry iron to \$17.50 are specifying in their contracts that all iron carried over to the first quarter will be billed at \$18. This, it is expected, will have a tendency to check speculative buying and cause some consumers to take iron more promptly than they might otherwise. One producer of Ohio silvery iron has withdrawn prices and there is talk of an advance on that grade. Specifications from the motor car industry continue heavy.

Prices per gross ton at Cleveland:

N'th'n fdy., sil.	1.75 to 2.25	\$18.50
S'th'n fdy., sil.	1.75 to 2.25	22.25
Malleable		18.50
Ohio silvery, 8 per cent.		28.00
Basic Valley furnace	\$16.25 to	16.50
Stand. low phos., V'ley fur.	26.50 to	27.00

Prices, except on basic and low phosphorus, are delivered Cleveland. Freight rates: 50c. from local furnaces; \$3 from Jackson, Ohio; \$6 from Birmingham.

Bolts, Nuts and Rivets.—Bolt and nut manufacturers have reestablished for the fourth quarter the present discount of 70 per cent off list for bolts and nuts. This discount has been in effect since the present list was adopted, April 1, 1927. Present prices were reaffirmed in spite of the expectation of manufacturers that they will have to pay more for steel bars for the coming quarter. However, wire, which is used for much of their product, will cost no more than during the present quarter. While rivet manufacturers have not announced their prices for the last quarter, they will probably reestablish the present base of \$2.90, Pittsburgh and Cleveland, for large rivets. Bolt and nut orders this month are not starting out quite as well as in August.

Iron Ore.—The movement continues heavy, and some consumers have recently increased shipping orders. Ore on Lake Erie docks Sept. 1 was 5,718,482 tons, compared with 6,074,966 tons on the same date a year ago.

Sheets.—Demand from the automotive industry continues heavy, and considerable business in auto body sheets has been taken for October shipment at the 4c. price, which was reestablished for the last quarter. There has been no test of the advanced prices on other grades for the next quarter. Mills that set Sept. 10 as the deadline for specifications on contracts have got most of their

No. 9 ann'l'd wire, per 100 lb.	\$2.85
No. 9 gal. wire, per 100 lb.	3.30
Com. wire nails, base per keg	2.85

*Net base, including boxing and cutting to length.

specifications in, although they met with some resistance from buyers. However, some of the mills did not include this restriction in their contracts and will accept specifications through this month. Prices for current orders are unchanged at 2.65c., Pittsburgh, for black, 1.90c. to 2c. for blue annealed, and 3.40c., Pittsburgh, and 3.50c., Valley, for galvanized.

Strip Steel.—Orders are still heavy, particularly for hot-rolled strip. Not much new business is coming out in hot-rolled material at regular prices as the larger buyers will be carried through the last quarter at the old prices. The new card of extras making one base price for all gages and widths will probably be placed in effect by some of the mills Oct. 1. Cold-rolled strip appears to have been definitely established at 2.75c., Cleveland, for the fourth quarter for the larger buyers and old customers, thus making the recent advance to 2.85c. applicable only to small-lot business. The 2.65c. price that prevailed recently seems no longer in evidence.

Old Material.—The market is very firm and the top prices that prevailed a week ago have become more general, as dealers having short orders are forced to pay the advance. No. 1 heavy melting steel for one local mill is bringing \$13.50 to \$14 and for another \$14 to \$14.50, with reports of as high as \$14.75 being paid. The higher range of prices is being paid to fill orders taken at \$13.85. Dealers are paying \$10 to \$10.50 for blast furnace scrap to cover \$9.65 contracts. Most mills have enough scrap due on old contracts to last them for some time and show no disposition to pay present prices, although some probably would be willing to make purchases at a moderate advance above their last buying prices. One Valley mill has advised the trade that it will not pay above \$15.50 for No. 1 heavy melting steel. A local consumer has curtailed shipping orders materially, which may furnish some relief to scrap buyers.

Prices per gross ton delivered consumers' yards:

Basic Open-Hearth Grades	
No. 1 heavy melting steel	\$13.50 to \$14.00
No. 2 heavy melting steel	13.00 to 13.25
Compressed sheet steel	12.50 to 13.00
Light bundled sheet stamp'gs	11.50 to 11.75
Drop forge flashings	11.50 to 12.00
Machine shop turnings	7.75 to 8.25
No. 1 railroad wrought	11.50 to 12.00
No. 2 railroad wrought	13.50 to 13.75
No. 1 busheling	10.50 to 11.00
Pipes and flues	9.00 to 9.50
Steel axle turnings	12.50 to 13.00
Acid Open-Hearth Grades	
Low phos. forging crops	16.00 to 16.50
Low phos., billet, bloom and slab crops	17.00 to 17.50
Low phos. sheet bar crops	16.50 to 17.00
Low phos. plate scrap	15.50 to 16.00
Blast Furnace Grades	
Cast iron borings	10.00 to 10.50
Mixed bor'gs and short turn'gs	10.00 to 10.50
No. 2 busheling	10.00 to 10.50
Cupola Grades	
No. 1 cast	16.00 to 16.50
Railroad grate bars	11.00 to 12.00
Stove plate	12.00 to 12.50
Rails under 3 ft.	16.75 to 17.25
Miscellaneous	
Railroad malleable	15.00 to 15.50
Rails for rolling	16.25 to 16.50

Semi-Finished Steel.—Buyers as yet are showing no interest in fourth

quarter contracts. A local maker is asking \$33, Cleveland, for sheet bars, billets and slabs for that delivery. Specifications are still heavy.

Warehouse Business.—Jobbers' sales, particularly of steel bars, show some gain over those of last month. Sheets are moving well. Prices generally are firm.

Coke.—Jobbing foundries in this territory are getting busier and this has caused a better demand for foundry coke shipments against contracts. Prices are unchanged at \$3.50 to \$4.85, ovens, for standard Connells-ville brands and \$7.75, Painesville, for Ohio by-product coke. Heating coke is firmer, now holding at \$2.75, ovens. By-product domestic coke is fairly active at \$4.50, Ohio ovens, for egg size. A local producer quotes \$6, delivered Cleveland, for egg and \$5.50 for nut.

Symposium on Blast Furnace Slag

"Preparation of Slag for the Market" is the title of a 33-page pamphlet issued as Symposium No. 6 by the National Slag Association, Cleveland. The symposium is one of a collection dealing with the characteristics and uses of blast furnace slag. The five previous symposiums have had as their respective subjects: "Absorption of Slag and Slag Concrete," "Resistance of Blast Furnace Slag to Abrasion and Wear," "Action of Slag Under High Temperatures and Fire," "Manufacture and Use of Slag Products" and "Bond in Slag and Slag Concrete."

Power Show at Detroit

More than 400 exhibitors are represented in the Power Exhibition being held this week in Detroit in connection with the forty-sixth annual convention of the National Association of Power Engineers. Practically every detail of present-day mechanical power, safety, heating and ventilating equipment is on exhibition in the 168,000 sq. ft. of floor space occupied by the show in Convention Hall, Detroit. The Michigan Association of Power Engineers is host to the delegates of the national organization.

Annual report of the Dominion Iron & Steel Co., Ltd., Montreal, for the year ended Dec. 31, 1927, shows net operating profits of \$1,859,215, and after deductions for sinking fund provisions, a balance before depreciation of \$845,118. Previous surplus amounted to \$90,065, making a total surplus at beginning of 1928, of \$935,183. As no public report was made for 1926, the year in which the company was placed under the administration of the National Trust Co., Ltd., comparisons are not available.

The Sharon Steel Hoop Co. is making trial runs of a new cold strip mill installation, with capacity for 50,000 tons a year. The extension was financed from the proceeds of a bond issue floated early in the year.

Pacific Coast

Inquiry for 1500 Tons of Steel for Oil Storage Tanks— Coast Business Is Well Sustained

SAN FRANCISCO, Sept. 8 (*By Air Mail*).—Movement of iron and steel products on the Pacific Coast continues well sustained. Some fair-sized awards were reported this week. The inquiry of the Shell Oil Co., San Francisco, for five 80,000 bbl. tanks for its Martinez plant, calling for 1500 tons of plates and shapes, is one of the few for storage tanks that have come before fabricators for figures this year.

Pig Iron.—Foundry iron sales and inquiries this week were limited to unimportant lots. Little improvement is noted in the rate of operations among jobbing foundries on the Coast. Stocks in foundry yards apparently are sufficient to take care of immediate requirements. Prices are unchanged.

Prices per gross ton at San Francisco:
*Utah basic \$25.00 to \$26.00
*Utah fdy., sil. 2.75 to 3.25 25.00 to 26.00
*Indian fdy., sil. 2.75 to 3.25 24.00 to 25.00

*Delivered San Francisco.
**Duty paid, f.o.b. cars San Francisco.

Bars.—Demand for reinforcing steel bars appears to be improving and some fair-sized lots were placed this week. Among these were 650 tons for the West Hanford Street sewer in Seattle and 210 tons for the West Stanislaus Irrigation District at Westley, Cal., booked by the Pacific Coast Steel Co. The Northwest Steel Rolling Mills secured 250 tons for a warehouse addition in Seattle and 175 tons for the Cushman spillway at Tacoma. Bids will be opened next week on 1800 tons for a college building at Berkeley. The Soule Steel Co. was low bidder on 165 tons for a storm drain in Los Angeles. Low prices prevail on material from warehouse stocks and 1.80c. apparently is general, little business being placed at a higher price. In the Los Angeles district, which has been on a much firmer basis, 1.80c. is also being quoted.

Plates.—Plate fabricators are keenly interested in the first large inquiry for oil storage tanks to come into this market this year. The Shell Oil Co. has issued an inquiry for five 80,000 bbl. tanks, calling for 1500 tons of plates and shapes. Action has been deferred until the next meeting of the directors of the East Bay Municipal

Utility District, Oakland, on 7200 tons for a distributing pipe line. The Birchfield Boiler Co. took 330 tons for a 32-in. welded pipe line at Tacoma, and the Western Pipe & Steel Co. secured 105 tons for a 36-in. pipe line in South Dakota for the United States Bureau of Reclamation. Plate prices range from 2.20c. to 2.30c., c.i.f.

Shapes.—Demand for structural steel is well sustained. Awards this week exceeded 3000 tons. Among the larger projects were 415 tons for the Marblemount bridge and 444 tons for the Nugents bridge in Washington, taken by the Pacific Car & Foundry Co.; 600 tons for the Exposition Building at Pomona, Cal.; 535 tons for a hotel in San Francisco, and 432 tons for a bridge for the Pacific Electric Railway, Los Angeles, taken by the McClintic-Marshall Co. Bids were opened this week on 230 tons and 120 tons respectively for the Kalama and Coweeman River bridges in Washington. Domestic shapes are firm at 2.35c., c.i.f. Coast ports.

Cast Iron Pipe.—The largest award was made by the Spring Valley Water Co., San Francisco, and called for 1062 tons for 6 and 8-in. Class 150 pipe. George H. Oswald, Los Angeles, took 149 tons of 2 and 4-in. Class B pipe

for the improvement of Fig Street in Compton, Cal. San Diego, Cal., placed 148 tons of 6 to 10-in. Class C pipe for the improvement of Garnet Street with the R. E. Hazard Contracting Co., San Diego. The American Cast Iron Pipe Co. took 320 tons of 2 to 16-in. Class B pipe for Santa Ana, Cal. About 100 tons of various sizes is involved in six other small improvement projects at San Diego, the contracts being awarded to several contractors. The Miracle Construction Co., San Diego, was low bidder on 355 tons of 4 to 10-in. Class B pipe for the improvement of streets in the Encanto District, San Diego. Bids were rejected by Compton, Cal., on 148 tons of 2 and 4-in. Class B pipe. San Bernardino, Cal., decided on welded steel pipe instead of cast iron pipe. The United States Cast Iron Pipe & Foundry Co. was low bidder on 1236 tons of 4 to 10-in. Class B pipe for Edmonds, Wash. Bids will be opened next week on 1467 tons of 4 to 12-in. Class B pipe for Clearwater, Cal. The inquiry for 1210 tons of 32-in. pipe for the improvement of East Eleventh and Taylor Streets, Tacoma, was withdrawn, as welded steel pipe was decided upon.

Steel Pipe.—Movement of standard steel pipe, while showing some improvement, is by no means heavy. Most distributors have good stocks on hand. Oil country goods, especially well casing, continues in good demand. No large pipe line tonnages are up for figures.

Canada

Canadian Pacific Orders 13,000 Tons of Rails—Structural Steel Outlook Good—Pig Iron Buying Increases

TORONTO, ONT., Sept. 11.—The Canadian Pacific Railway has ordered 13,000 tons of rails from the Algoma Steel Corporation, Sault Ste. Marie, Ont. This is sufficient to keep the Soo rail mill in operation until rolling starts on 1929 requirements. The Dominion Iron & Steel Co., Sydney, N. S., has maintained rail mill operations through the first eight months of the year at almost capacity and still has enough business ahead to continue until 1929 rail orders appear. This is the first year in some time that Canadian rail mills have had business sufficient to keep in operation through the summer. As a rule, rail mills have closed down at the end of May and have not resumed until fall or winter. This year, however, is an exception, not only with regard to rail mill operations, but in practically all lines of iron and steel.

Pig Iron.—The demand for merchant iron is holding at a high level. Melters are buying extensively for spot and future delivery. Fourth quarter contracting has been featured in business of the week. Prospects for early advances in Canadian pig

iron prices have a tendency to bring buyers in the market, many of whom are anxious to buy at the prevailing level. Producers, on the other hand, do not appear anxious to close long term contracts, but are accepting that offered. It is estimated that about 50 per cent of contract buyers are now covered to the end of the year, and others are showing a readiness to cover. Spot demand is also at a high level. Orders on this account range from 100 to 1000 tons, the larger quantities being for water delivery before the close of navigation. Several 2000-ton orders have been booked on contract for delivery over the rest of the year. Despite the fact that United States prices have been advancing and local producers have been considering higher prices here, changes have not yet gone into effect.

Structural Steel.—About 50,000 tons of structural steel orders probably will be placed before the end of the year, and prospective orders for reinforcing bars are only slightly less. Structural steel business in sight includes 7000 tons for the Hotel Toronto, Toronto; 8000 tons for the Bell

Old Material.—September has brought a stronger demand for scrap in the Toronto and Montreal markets. While much of the current business is for spot delivery, orders on this account invariably call for larger ton-

nages than formerly and consumers are buying more frequently. Several consumers have covered for requirements to the end of the year. Prospects of higher prices have had a tendency to strengthen the demand. Scrap supplies are still plentiful. Dealers are buying more freely both for direct shipment to consumers and for yard stocks. Prices are strong, but have not been changed.

Dealers' buying prices:

Per Gross Ton

St. Louis

Pig Iron Sales Include 15,000 Tons of Basic—Mills Have Backlogs of Sheets and Tin Plate—Scrap Higher

ST. LOUIS, Sept. 11.—A sale of 15,000 tons of basic pig iron by the St. Louis Gas & Coke Corporation for fourth quarter delivery to an East Side melter was the principal transaction of the week. The same maker sold 4400 tons of foundry iron for shipment through the remainder of the year. A leading Southern interest sold about 500 tons. Prices are being maintained by makers. One interest declined an order for 3000 tons offered at a figure under the market. Shipments are good, and the melt in the district is holding up well.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25, f.o.b.	
Granite City, Ill.....	\$19.00 to \$19.50
N'th'n No. 2 fdy., deliv'd St. Louis.	20.16
Southern No. 2 fdy., deliv'd.....	20.67
Northern malleable, deliv'd.....	20.16
Northern basic, deliv'd.....	20.16

Freight rates: 81c. Granite City to St. Louis; \$2.16 from Chicago; \$4.42 from Birmingham.

Coke.—Local by-product interests have increased the price of domestic coke 25c. a ton to \$11.25 for furnace sizes and \$10.25 for nut sizes, either delivered in St. Louis, or f.o.b. ovens, for shipment outside the district. Dealers are beginning to show interest in domestic sizes. The price of foundry coke is unchanged, with demand limited.

Finished Iron and Steel.—The Granite City Steel Co. broke all records in August for shipments of tin plate and is well booked up on this item for the remainder of 1928. The previous record month was March. Mills also have a backlog of sheets. The price situation continues to gain strength. Fabricators are showing

decidedly more interest in structural steel in the hope of better business. Railroad inquiries are light.

Old Material.—A leading mill bought about 4000 tons of heavy melting and shoveling steel during the week, and there has been better buying of other items. The market is firm at higher prices. Heavy melting steel, heavy shoveling steel, miscellaneous standard-section rails, railroad springs, No. 2 railroad wrought, rails for rolling, steel angle bars and railroad malleable are 25c. a ton higher, while machine shop turnings and No. 1 railroad wrought are up 50c. Railroad lists: Baltimore & Ohio, 7185 tons; Wabash, 2975 tons; Ann

German Mines Substitute Steel for Wood Props

HAMBURG, GERMANY, Aug. 18.—With a view to increasing the domestic market for steel and reducing costs in coal mining, the steel industry is advocating the use of steel instead of wood in mine supports. Use of wood for these supports declined from 5,100,000 pieces in 1925 to 4,370,000 in 1927, although there was an increase of 16 per cent in coal production during this period. As most of the coal mines are owned by steel companies, it is planned to substitute steel for timber in about 75 per cent of the mines during the next five years. At present about 9 per cent of the coal mines are using steel exclusively, while only 5 per cent used it in 1927, 3 per cent in 1926 and 1 per cent in 1925. It is expected that by the end of this year about 14 per cent of the mines will be using steel supports.

According to an estimate of a number of coal mines that are using steel, the saving in costs is considerable. When wood was used exclusively the cost of timber per ton of coal produced amounted to 91 pf. (22c.), whereas steel costs about 45 pf. (11c.) per ton of coal produced. It is estimated that the total savings per month in the Ruhr, with 75 per cent of the mines using steel instead of wood, will be close to 2,600,000 m. (\$619,000).

The executive committee of the Pittsburgh Foundrymen's Association has decided to dispense with the September meeting this year and will start its fall and winter activities with the October meeting, which will be held on Monday evening, Oct. 15, at the Fort Pitt Hotel, Pittsburgh.

Boston

Pig Iron Firmer in New England—Scrap Prices Advance— Larger Demand for Foundry Coke

BOSTON, Sept. 11.—Pig iron sales in the past week were 7000 to 8000 tons, and included one 2000-ton, one 1500-ton and one 800-ton lot of two grades to Connecticut foundries. The Mystic Iron Works again topped the list in bookings. That stack has sold approximately 15,000 tons more of iron this year than it has made. Recent transactions included eastern and western Pennsylvania, New York State, Alabama, Buffalo, Indian and Dutch irons. Quite a little malleable iron is moving for mixture purposes. Eastern Pennsylvania No. 2X is selling at \$24.15 a ton, delivered, and No. 1X at \$24.65, an advance of 50c. a ton. Apparently no Buffalo No. 2X is now available at less than \$17 a ton, furnace, and at least one producer is getting \$17.50. The Mystic Iron Works quotations are practically on a delivered Buffalo basis. Imported No. 2X iron is \$21.50 to \$22 a ton, on cars dock here, duty paid.

Foundry iron prices per gross ton deliv'd to most New England points:

*Buffalo, sil. 1.75 to 2.25..	\$21.91
*Buffalo, sil. 2.25 to 2.75..	\$21.91 to 22.41
†Buffalo, sil. 1.75 to 2.25..	20.78
†Buffalo, sil. 2.25 to 2.75..	20.78 to 21.28
East. Penn., sil. 1.75 to 2.25	23.65
East. Penn., sil. 2.25 to 2.75	24.15
Va., sil. 1.75 to 2.25.....	25.71
Va., sil. 2.25 to 2.75.....	26.21
Ala., sil. 1.75 to 2.25.....	23.16 to 25.02
Ala., sil. 2.25 to 2.75.....	23.66 to 25.52

Freight rates: \$4.91 all rail and \$3.78 rail and water from Buffalo; \$3.65 from eastern Pennsylvania; \$5.21 all rail from Virginia; \$6.91 to \$8.77 from Alabama.

*All rail rate. †Rail and water rate.

Imports.—Importations of pig iron at Boston in August were 1095 tons, of which about 250 tons was Dutch and the rest Indian. Importations in July totaled 1196 tons; in August, last year, 2262 tons; in August, two years ago, 6347 tons. August importations of ore were 16,084 tons,

made up of 5783 tons from Tunis, 6800 tons from Algeria and 3401 tons from Australia. July ore importations were 9800 tons, while those in August, last year, were 34,227 tons, and in August, two years ago, 26,232 tons.

Coke.—Specifications against foundry coke contracts continue of good proportions, and at least one maker is behind on deliveries. This company has been making liberal water shipments to Connecticut points and as soon as these are completed expects to catch up on all-rail specifications. The freer movement of fuel to foundries is due to their desire to stock up for the winter and not because of any appreciable increase in the melt of iron. Foundry coke remains at \$11 a ton, delivered within a \$3.10 freight rate zone. Domestic coke is moving in volume. The new New Haven, Conn., ovens should be in production within a week or two.

Cast Iron Pipe.—Private buying of pipe is again on a fairly large scale. The only municipal business closed recently was 100 tons of 6 and 8-in. pipe for Revere, Mass., which went to the Warren Foundry & Pipe Co. It is believed several New England cities will come into the market within the next month. The market for small pipe holds steady, but large dimensions can be had at concessions. Pipe foundries have much less business on their books than they had a year ago, and are operating at not more than 85 per cent of capacity. Prices are: 4 in., \$45.10 to \$46.10 a ton, f.o.b. common Boston freight rate points; 6 to 12 in., \$41.10 to \$42.10. The usual \$5 differential is asked on Class A and gas pipe.

Fabricated Steel.—The past week was the quietest experienced by steel fabricators so far this year. Only two contracts of size were let, calling for a total of 525 tons, and bookings of small tonnages dropped to a minimum. Several tonnages ranging from 100 to 300 tons are pending.

Old Material.—Further expansion of the movement of old material out of New England developed in the past week. With the better demand has come higher prices for many grades of scrap. Heavy melting steel is easily 75c. a ton higher, and rails have also advanced that much. Steel turnings bring 50c. a ton more, while mixed borings and turnings are \$5.50 to \$6 a ton, on cars shipping point, against \$5 to \$5.50 a week ago. Long bundled skeleton and forge scrap are 50c. a ton up. The higher prices for heavy melting steel have slowed up the export market, and there is a possibility that shipments to Danzig will be temporarily discontinued. Most of the shipments are to the Pittsburgh territory. The Boston & Maine Railroad closes bids this week on 65 cars of miscellaneous material.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel..	\$10.25 to \$10.75

Birmingham

Pig Iron Buying Steady But Not Large—Steel Bookings Fair—Scrap Stronger

BIRMINGHAM, Sept. 11.—Pig iron buying has been steady for the past few days. The number of consumers covering through the fourth quarter at the current price of \$16.25 is somewhat less than expected, though forward buying as a whole is much better than it was this far in advance of either of the two preceding quarters. A better sentiment is noted. Some basic iron is being exported to the Orient by way of the Warrior River barge line. September shipments to date are slightly ahead of the make. The No. 3 Ensley furnace of the Tennessee company was changed from basic to foundry on Sept. 3. The No. 2 Bessemer furnace of this company was put in operation Sept. 7, having been banked since Aug. 21. The active

furnaces at present total 17, of which 12 are on foundry, three on basic, one on ferromanganese and one on recarburizing iron. The rebuilding of the Alabama City furnace of the Gulf States Steel Co. will be completed within a few days.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil.....	\$16.25
No. 1 fdy., 2.25 to 2.75 sil.....	16.75
Basic	16.25

Finished Steel.—Bookings so far this month are much better than for the first part of September last year. Inquiries are good and sales officials expect the fourth quarter to be the most active period of the year. Sheet specifications are holding up to a higher rate than had been expected. Lettings of fabricated structural steel

contracts continue fairly good. Concrete reinforcing bars are active in contracts under 100 tons. The Ingalls Iron Works Co. will furnish 350 tons of structural steel for the Mobile, Ala., mill of the Rome Wire Co. Prices are firm. The Ensley rail mill of the Tennessee company was placed in operation again on Sept. 9 after a few weeks' idleness. Nine open-hearth furnaces have been in operation for the past two weeks. The Tennessee company has six active at Fairfield and the Gulf States Steel Co. has three on at Alabama City.

Cast Iron Pipe.—A steady volume of private business has featured the market in the past several weeks. The total volume has not been satisfactory, and with very few exceptions the individual tonnages have been small. Municipal lettings of size have been very few. The National Cast Iron Pipe Co. received an order last week for about 400 tons from Plain Dealing, La. Bids have been opened on fair-sized tonnages at Mobile, Ala., and Bonifay, Fla., Sulphur, La., will open bids Sept. 18 on about 13,500 ft. of 6 to 10-in. pipe. Prices remain steady at \$34 to \$35. Soil pipe has not been active for some time, though

several shops have been producing steadily.

Coke.—Interest in coke has been stimulated, following the recent advance in the price of pig iron, and many consumers are contracting for their requirements for the next six months. Shipments are heavier than for some time. Quotations remain at \$5 for both spot and contract coke.

Old Material.—Prices show an upward trend as demand grows stronger. Quotations on heavy melting steel have advanced from \$9 to \$11. Rails for rolling have increased to \$14, while an advance of \$1.50 has been made on scrap steel rails, short shoveling turnings, tramcar wheels and cast iron car wheels. Shipments to mills are larger than at any time this summer and stocks on yards are being rapidly depleted.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel.....	\$10.00 to \$11.00
Scrap steel rails.....	11.50 to 12.00
Short shoveling turnings...	8.00 to 8.50
Cast iron borings.....	8.00
Stove plate	13.50
Steel axles	19.00 to 20.00
Iron axles	21.00 to 22.00
No. 1 railroad wrought...	10.00 to 10.50
Rails for rolling.....	14.00
No. 1 cast	15.00
Tramcar wheels.....	13.00 to 14.00
Cast iron carwheels.....	13.00 to 13.50
Cast iron borings, chem...	13.50 to 14.00

Cincinnati

Pig Iron Demand Has Abated—Scrap Market Advances—Steel Demand Steady

CINCINNATI, Sept. 11.—After two weeks of active pig iron buying, sales have subsided and local dealers booked somewhat meager tonnages in the past seven days. Most consumers have covered fourth quarter requirements and therefore open inquiries are scarce. Small orders are being placed quietly by some melters. In fact, the majority of pig iron purchased recently has been bought in private transactions with comparatively little competitive bidding. The Tennessee furnace has advanced its asking price 25c. a ton to \$16.25, base Birmingham, to be on an equality with Alabama interests, but nevertheless is still accepting attractive tonnages at \$16. Northern Ohio iron is being offered locally at a delivered price of \$19.90, although in some instances sellers are said to be holding to \$20.40. Ironton companies continue to dispose of small lots of iron from yard stocks at from \$17 to \$18, base furnace. Since much of the iron is shipped by barge down the Ohio River and there is no established transportation charge, it is difficult to determine the going price at Ironton.

Prices per gross ton, deliv'd Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25	\$18.89 to \$19.89
So. Ohio malleable.....	20.14 to 20.89
Ala. fdy., sil. 1.75 to 2.25..	19.94
Ala. fdy., sil. 2.25 to 2.75..	20.44
Tenn. fdy., sil. 1.75 to 2.25	19.69
So'th'n Ohio silvery 8 per cent	26.89

Freight rates, \$1.89 from Ironton and Jackson, Ohio; \$3.69 from Birmingham.

Finished Material.—Demand for bars, shapes and plates has been well sustained at 1.90c., base Pittsburgh, for prompt shipment, although sellers are now engaged in soliciting fourth quarter contracts on a basis of 2c. There is increased activity in structural steel, although small jobs ranging from 25 to 100 tons make up the bulk of the tonnage. The only sizable award called for 290 tons of structural steel to be furnished by the Dayton Structural Steel Co. to a Middletown, Ohio, company. Gas holder fabricators have stepped up production somewhat to conform to a larger volume of incoming business. Orders and specifications for wire goods have been rather sluggish. Common wire nails

Warehouse Prices, f.o.b. Cincinnati

Base per Lb.

4-in.	38.00
Seamless steel boiler tubes, 2-in....	19.00
4-in.	39.00

are quoted at \$2.55 per keg, Ironton, with a 14c. barge rate to this city. Some Eastern mills are meeting this price at Ohio River points, but these irregularities disappear in territory reached only by all-rail deliveries. District sheet companies state that bookings have held up to a high level, with the result that the volume of unfilled orders on hand has attained impressive proportions. Sales have been remarkably diversified and prices have not changed, although a firmer tone is noted.

Warehouse Business.—Shipments out of local warehouses have been of fairly good volume and have been well distributed among all products. Louisville jobbers are reported to be quoting \$2.65 per keg, or lower, on common wire nails, although prices in the Cincinnati market have not been affected. Otherwise, schedules remain unchanged.

Coke.—Specifications of by-product foundry coke are appreciably better than in August and indications are that this month will show a gain of about 10 per cent. Wise County foundry coke is quoted at \$4 to \$5, f.o.b. ovens, with furnace grades bringing \$3.50 to \$3.75. New River beehive foundry coke is selling at \$6.50 to \$7, ovens.

Old Material.—Steel plants are showing more interest in forward buying and consequently activities of dealers have been stimulated. Prices of a number of items have increased from 25c. to \$1 a ton, although heavy melting steel has not changed in the past week. Railroad offerings this week include the Southern, 6000 tons; Chesapeake & Ohio, 8000 tons; and Louisville & Nashville, 12,500 tons.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel.....	\$11.75 to \$12.25
Scrap rails for melting....	12.00 to 12.50
Loose sheet clippings.....	9.00 to 9.50
Bundled sheets	9.75 to 10.25
Cast iron borings.....	8.50 to 9.00
Machine shop turnings....	8.00 to 8.50
No. 1 busheling.....	10.50 to 11.00
No. 2 busheling.....	6.00 to 6.50
Rails for rolling.....	13.00 to 13.50
No. 1 locomotive tires.....	13.00 to 13.25
No. 2 railroad wrought....	11.75 to 12.25
Short rails	16.00 to 16.50
Cast iron carwheels.....	12.00 to 12.50

Stove plate	9.25 to 9.75
Brake shoes	10.25 to 10.75
Railroad malleable	12.25 to 12.75
Agricultural malleable....	11.25 to 11.75

Lower Production of Trackwork Reported

Production of trackwork for T-rail track of 60 lb. a yard and heavier is reported for August by the American Iron and Steel Institute at 11,040 net tons—the lowest figure since last January. This compares with 11,776 tons in July and with 13,387 tons in August, 1927, and 15,203 tons in August, 1926.

For the first eight months the total has been 99,945 tons, comparing with 120,873 tons in the first eight months of 1927 and 139,501 tons in 1926.

Detroit

Automobile Production Continues to Break Records—1927 Figures Surpassed by Nearly All Companies

DETROIT, Sept. 11.—Industrial activity in this section continues upward, with the automotive industry still achieving higher production. In some cases new records have been made during the past month, and in practically all cases 1927 figures have been surpassed.

For the fifth consecutive week the labor barometer of the Employers' Association has broken all records. The increase for the week ended Sept. 4 amounted to 5287, bringing the total to 298,744. These figures are the total of persons on the combined payrolls of Detroit companies which employ two-thirds of the city's industrial working population. The increase for the week ended Aug. 28 was 5854. A year ago the total figure was 98,079 less than the figure of Sept. 4.

Cadillacs and LaSalles shipped during August totaled 5142 units, or 616 better than the company's highest previous record.

The Chevrolet Motor Co. last week turned out its millionth car for the current year.

It is estimated that the September production for Chrysler Corporation will set a new record. On Sept. 1 this company's unfilled orders amounted to 53,417 units. Recently a new production record for one day was established by the Chrysler Corporation, when 1370 cars were produced.

Production at the Dodge plants is running about 1000 units a day and is steadily being increased.

Assembly of Ford Model A cars and trucks has reached about 4000 units a day, with 500 additional units at Canadian plants. Ford's employment shows a new high level, at 120,293.

August production by the Graham-Paige Motors Corporation amounted to 11,207 cars, which was more than 50 per cent of the entire 1927 production.

August production for the Hudson Motor Car Co. was approximately 22,000 units.

The previous annual record for the Hupp Motor Car Co. was achieved in 1926, when the total was 45,426 cars. The total for the present year to Sept. 1 is 50,457 cars.

August production of the Olds Motor Works stands at 7773 cars. A new one-day record was established on Aug. 31, with 670 units, surpassing the previous record of March 31 of 613 units.

The Packard Motor Car Co. in August shipped 5001 cars, exceeding the previous record of May, 1928, by 219 cars.

The Reo Motor Car Co., with a total production in August of 4823 units, slightly exceeded the July figure of 4814.

A. R. Erskine, president Studebaker Corporation, states that profits for the current third quarter will show an increase of approximately 25 per cent over the same period of 1927.

August sales have exceeded 15,000 units, as against 11,437 for August a year ago.

The Buick Motor Co.'s July production of 15,000 units was increased in August to 27,000 units. The September schedule is 32,000 units.

A contract totaling \$10,000,000 worth of bodies, for delivery over five years, has been placed by Willys-Overland Co. with the Mengel Co. The Hays Body Corporation has recently received two orders from Marmon Motor Car Co. which will increase the former's production by approximately \$10,000,000 annually.

Pig iron producers serving the district have sold a large tonnage for fourth quarter delivery on an \$18 base.

There has been a great deal of activity in the scrap market in this district during the past two weeks, with the result that advances of 50c. per ton have been registered on steel mill and blast furnace materials. Mills and furnaces have found difficulty in covering at present prices with dealers holding stocks.

Dealers' buying prices per gross ton f.o.b. cars, Detroit:

Hvy. melting and shov. steel	\$12.00 to \$12.50
Borings and short turnings	8.00 to 8.50
Long turnings	7.00 to 7.50
No. 1 machinery cast.	14.00 to 15.00
Automobile cast.	19.00 to 20.50
Hydraulic comp. sheets	11.50 to 12.00
Stove plate	11.00 to 12.00
No. 1 busheling	9.50 to 10.00
Sheet clippings	7.50 to 8.00
Flashings	10.00 to 10.50

Buffalo

Pig Iron Quieter After Price Advances—Steel Mills Average 90 Per Cent Operation

BUFFALO, Sept. 11.—Pig iron business has been quiet following the recent price increase. Indication that the market is stiffening is shown by the action of one producer in increasing its price for No. 2 plain, 1.75 to 2.25 silicon, to \$18.50 for delivery in the district and \$18 on New England business. One lot of 500 tons of foundry was sold at \$18, base, and two orders totaling 1000 tons were sold by another maker at \$18, base. Considerable buying is looked for in the near future on the theory that the majority of the smaller users have not yet covered for last half. August was the biggest month of the year with most of the producers.

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil. 1.75 to 2.25	\$17.00 to \$17.50
No. 2X fdy., sil. 2.25 to 2.75	17.50 to 18.00
No. 1X fdy., sil. 2.75 to 3.25	18.50 to 19.00
Malleable, sil. up to 2.25	17.50 to 18.00
Basic	16.50 to 17.00
Lake Superior charcoal	27.28

Finished Iron and Steel.—Mills are holding to a 90 per cent operation, with orders continuing fairly heavy. Some orders for bars and shapes for fourth quarter delivery have been taken at 2.10c., Buffalo. Prices on alloy steel have been increased \$2 a ton. Sheet prices are firm and business is reported as good. Two reinforcing bar jobs, one for 375 tons and another for 400 tons, are being figured. Bolt and nut business continues

fair and the wire cloth and mesh business is good.

Old Material.—No large orders were taken during the week and business is largely among dealers covering on the last two large purchases. Heavy melting steel is scarce, owing to outside markets being stronger than the local market. There have been a few scattered sales of 2-ft. rails at \$17 to \$17.50 and No. 1 machinery cast at \$14 to \$14.50. Dealers are still seeking to cover against the last outstanding order for stove plate, 2500 tons. A few lots of stove plate have been sold at \$14.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades	
No. 1 heavy melting steel	\$14.00 to \$15.00
No. 2 heavy melting steel	12.25 to 12.50

Non-Ferrous Metal Markets

Copper Sales Very Heavy, Tin Sold at Lower Prices, Lead Active, Zinc Quiet and Firm

Copper.—Sales since Labor Day have been very heavy, being estimated at 35,000 to 40,000 tons for the week ended Sept. 8. About 20,000 tons of this was for domestic consumption. Sales this week, Monday and Tuesday, have been on a large scale, particularly to domestic consumers, and it is reported that several producers have withdrawn from the market for October shipment. Most of the domestic sales have been for October delivery, with some November metal included. Foreign sales have consisted largely of September requirements and some for October. Considerable interest centers in the

price situation, which is still unchanged at 14.75c., delivered in the Connecticut Valley, and at 15c., c.i.f. European ports, for electrolytic copper. If sales keep up at the present volume, which the Copper Institute is reported to have estimated as fully equal to the heavy buying of last May, price advances would seem justified, but responsible opinion is that quotations will remain where they are through the remainder of the year. Lake copper is moderately active and firm at 14.75c. and 14.87½c., delivered.

Tin.—Considering the holiday on Sept. 3, sales for the week ended Sept. 8 were very heavy at about 1200 tons. Both consumers and dealers were buyers. The most interesting day was Friday, Sept. 7, when the agent here of a large London house sold 175 tons on the New York Metal

Exchange at a sacrifice in price, and at the same time puzzling the trade. It is many months since as much business was done on the local exchange in one day. On Monday the market was quiet and steady, with about 100 tons changing hands, and Tuesday about 300 tons was sold, mostly to consumers, with spot Straits tin quoted at 47.12½c., New York. Prices in London Tuesday were considerably lower than a week ago, with spot standard quoted at £209 12s. 6d., future standard at £208 5s., and spot Straits at £213 2s. 6d. The Singapore market was £211 10s. Arrivals thus far this month have been 4185 tons, with 6855 tons reported afloat.

Lead.—Business on Monday and Tuesday was fairly large, but not as heavy as in the two previous weeks. Buying has been well distributed and prices are firm at 6.25c. to 6.27½c.,

Zinc sheets, open.....	11.00c. to 11.50c.

Non-Ferrous Rolled Products

Mill prices on bronze, brass and copper products have not changed since the advances of May 25. Zinc sheets have been quoted at 9.75c. per lb., base, since July 30, and lead full sheets at 10c. to 10.25c. since May 29.

List Prices, Per Lb., f.o.b. Mill

On Copper and Brass Products, Freight up to 75c. per 100 Lb. Allowed on Shipments of 500 Lb. or Over

Sheets—	
High brass	19.25c.
Copper, hot rolled.....	23.50c.
Zinc	9.75c.
Lead (full sheets).....	10.00c. to 10.25c.

Seamless Tubes—	
High brass	24.12½c.
Copper	25.00c.

Rods—	
High brass	17.00c.
Naval brass	19.75c.

Wire—	
Copper	16.75c.
High brass	19.75c.
Copper in Rolls.....	22.50c.
Brazed Brass Tubing.....	27.25c.

Aluminum Products in Ton Lots

The carload freight rate is allowed to destinations east of Mississippi River and also to St. Louis on shipments to points west of that river.

Sheets, 0 to 10 gage, 3 to 30 in. wide	33.00c.
Tubes, base	42.00c.
Machine rods	34.00c.

Old Metals, Per Lb., New York

Buying prices represent what large dealers are paying for miscellaneous lots from smaller accumulators and selling prices are those charged customers after the metal has been properly prepared for their uses.

	Dealers' Buying Prices	Dealers' Selling Prices
Copper, hvy. crucible.....	12.625c.	14.00c.
Copper, hvy. and wire	12.50c.	13.50c.
Copper, light and bottoms	10.75c.	11.75c.
Brass, heavy	7.00c.	8.25c.
Brass, light.....	6.00c.	7.25c.
Hvy. machine composition	9.75c.	10.75c.
No. 1 yel. brass turnings	8.75c.	9.50c.
No. 1 red brass or compos. turnings...	9.00c.	10.00c.
Lead, heavy.....	5.25c.	5.625c.
Lead, tea	3.75c.	4.25c.
Zinc	3.00c.	3.50c.
Sheet aluminum	12.50c.	14.50c.
Cast aluminum	11.75c.	13.50c.

Rolled Metals, f.o.b. Chicago Warehouse

(Prices Cover Trucking to Consumers' Doors in City Limits)

Sheets—		Base per Lb.

Brass	25.62½c.	
Copper	26.50c.	
Brass Rods	17.00c.	
Brazed Brass Tubes.....	27.25c.	

St. Louis, with the quotation of the leading interest unchanged at 6.40c., New York.

Zinc.—Orders for prime Western zinc thus far this month have been in moderate volume, but the tone of the market is good, with prices steady and unchanged at 6.25c., St. Louis, or 6.60c., New York. Interest centers in the ore situation, data for the week ended Sept. 8 showing that output has not yet been restricted adequately. The output was 12,250 tons and the shipments were only about 8800 tons, with sales about 4530 tons. Thus stocks are larger at close to 45,600 tons, an increase for the week of about 3400 tons. The quotation is unchanged at \$40, Joplin.

Antimony.—Chinese metal is considerably higher at 10.62½c., New York, duty paid, for all positions, an increase of ½c. over last week. Reports of a combination of interests in China and more demand from consumers and dealers here are the cause.

Nickel.—Ingot nickel in wholesale lots is quoted at 35c., with shot nickel at 36c. and electrolytic nickel at 37c. per lb.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is quoted at 23.90c. per lb., delivered.

Non-Ferrous Metals at Chicago

CHICAGO, Sept. 11.—This market is quiet with prices lower for tin and lead. Sales of old metals are light.

Prices, per lb., in carload lots: Lake copper, 15.25c.; tin, 47.50c.; lead, 6.35c.; zinc, 6.35c. in less-than-carload lots; antimony, 12c. On old metals we quote copper wire, crucible shapes and copper clips, 10.75c.; copper bottoms, 9.75c.; red brass, 9.50c.; yellow brass, 7.25c.; lead pipe, 4.75c.; zinc, 3.50c.; pewter, No. 1, 30c.; tin foil, 36.25c.; block tin, 45.25c.; aluminum, 12c.; all being dealers' prices for less-than-carload lots.

August Ore Shipments Increase, Year's Total Lower

Shipments of iron ore from the Lake Superior region amounted to 9,242,869 gross tons in August, an increase of 467,376 tons, or 5.33 per cent, above the 8,775,493 tons shipped from upper Lake ports in August, 1927. The total for the season to Sept. 1, or 32,517,693 tons, declined 2,636,223 tons, or 7.5 per cent, compared with the 35,153,916 tons shipped to Sept. 1, 1927. The table gives the shipments for August and for the season in 1928 and 1927 in gross tons.

MOVEMENT OF LAKE SUPERIOR ORE				
Port	August, 1928	August, 1927	To Sept. 1	
			1928	1927
Escanaba	929,800	978,799	3,302,615	3,772,445

Dwight & Lloyd Patent Decision Affirmed

The decision of the lower court (United States District Court for the Southern District of New York) in the suit of the Dwight & Lloyd Sintering Co. vs. John E. Greenawalt has been affirmed by the United States Circuit Court of Appeals. In the original suit infringement of seven patents was alleged, these covering the process of producing a sinter out of finely pulverized metalliferous ores. The court found that the long delay in bringing suit precluded any recovery of profits from the defendant under the basic down-draft sintering patent, although Dwight & Lloyd are recognized as the inventors of this contribution to the art and its importance is acknowledged.

As to the other patents in the suit, the decision on the particular claims before the court turned on various technical questions and the interpretation of certain phases of the patent law and Patent Office practice. Suits are still pending under the same patents in other jurisdictions against different defendants, and it is expected that one or more of these suits will be brought to trial in order to reach the United States Supreme Court on the technical questions presented.

The Dwight & Lloyd Sintering Co. is the owner of various patents covering the construction and operation of sintering machines which were not involved in this litigation.

Bingham & Taylor Take Over W. P. Taylor Co., Buffalo

The firm of Bingham & Taylor, Buffalo, has been incorporated to take over the steel foundry of the W. P. Taylor Co., 575 Howard Street, Buffalo. In addition to making iron and steel castings, railroad supplies, water and gas fittings and doing general foundry work as the old company did, the new company will produce alloy castings of steel, bronze and nickel for chemical work.

Officers of the new company are: James W. Gibney, president; William J. Gibney, vice-president, and J. H. Gardiner, secretary and treasurer. Directors are the three officers, with W. H. Crosby, Oliñ Dibble, A. C. Smith and Burt C. Weber, all of Buffalo.

The foundry is one of the oldest of its kind in the United States, having been founded in 1849 by Robert Bing-

ham. In 1884, W. Perry Taylor obtained an interest in the company and the name was changed to Bingham & Taylor. Later when Mr. Bingham retired the firm became known as the W. P. Taylor Co. Recently Mr. Taylor retired from business.

Valley Mills Operating at Above 85 Per Cent

YOUNGSTOWN, Sept. 11.—Production schedules in the Mahoning Valley this week continue at above 85 per cent, with 46 of 53 independent open-hearth furnaces melting. Including the Steel Corporation furnaces, a total of 59 of 68 are active. Of 127 Valley sheet mills, 113 are scheduled, as are 14 of 20 pipe mills. Strip mill capacity is occupied at a high rate.

Obituary

CHARLES E. DINKEY, for 20 years general superintendent Edgar Thomson works, Carnegie Steel Co., Braddock, Pa., and connected with the steel industry for 50 years, died at his home in Pittsburgh Sept. 8. Born in Bowmanstown, Pa., Aug. 4, 1868, Mr. Dinkey went to work as a messenger at the Edgar Thomson furnaces of Carnegie Brothers & Co. He served in various capacities until 1900, when he was appointed general superintendent of the plant. Since 1920, when he resigned that position and retired from active work, Mr. Dinkey had devoted himself to the securities brokerage business as president of Dinkey & Todd Co. He was a member of the American Institute of Mining & Metallurgical Engineers, the American Iron and Steel Institute and several Pittsburgh clubs. He was a brother of Alva C. Dinkey, now president Midvale Co., Philadelphia.

HENRY CHALFANT, chairman Spang, Chalfant & Co., Inc., Pittsburgh, died at Biarritz, France, Aug. 27. Mr. Chalfant apparently was in good health when he departed for Europe in July. He was 62 years of age, a native of Pittsburgh, and throughout his business life had been identified with the company that his father, John Chalfant, helped to found 100 years ago.

WILLIAM H. YAWGER, vice-president Weston Electrical Instrument Corporation, Newark, N. J., died on Sept. 3. He had been associated with the corporation and its predecessor for 34 years, having served as director of purchases and subsequently as treasurer and vice-president. He had been in poor health for three years and retired from active duty about three months ago.

WILLIAM H. GENSKE, secretary Lakeside Bridge & Steel Co., North Milwaukee, died on Aug. 31 after a brief illness. He was born in Waukesha County, Wis., in 1868, and had been identified with the Lakeside company for many years.

PERSONAL

WALLACE G. IMHOFF, formerly metallurgist in the electrical materials department of Hubbard & Co., Pittsburgh, has opened an office at 401 Highland Building, Pittsburgh, to engage as a consulting metallurgical engineer in pickling and galvanizing. His practical experience in the galvanizing field dates back 15 years, when he started in the galvanizing department of the American Steel & Wire Co. at Rankin, Pa. He received his formal technical training at the Carnegie Institute of Technology, from which he received degrees in engineering and science, and has since studied at the University of Wisconsin, Harvard University and the University of Pittsburgh. Mr. Imhoff is a contributor to *THE IRON AGE*.

W. A. BRIGGS, for many years in charge of the service department of the Boston Woven Hose & Rubber Co., Boston, has been appointed sales manager for that company. R. J. OWENS has been named merchandise manager and H. F. MAXON has been made district field manager in charge of territory, including New York, Pennsylvania, New Jersey, Delaware and Maryland.

L. KATTENBURG, president of R. S. Stokvis & Zonen, Rotterdam, the Netherlands, arrived in New York on Aug. 31 for a visit of several weeks in this country.

FRED C. GARDNER, treasurer of E. C. Atkins & Co., Indianapolis, saw and machinery manufacturers, has been named chairman of a special committee to recommend a site for a municipal airport for Indianapolis.

BERNARD LESTER, assistant industrial sales manager Westinghouse Electric & Mfg. Co., East Pittsburgh, has been placed in charge of the company's business relationships with architects, builders, building contractors and manufacturers of machinery and motor-driven appliances, with headquarters at 150 Broadway, New York. Mr. Lester, who has been identified with the Westinghouse company for more than 20 years, was graduated from Haverford College in 1904.

WALTER J. KOHLER, president Kohler Co., Kohler, Wis., and one of the best known manufacturers of the Central West, was nominated as the Republican candidate for governor of Wisconsin at the primaries on Sept. 4.

GEORGE O. WITH, formerly Chicago manager of the Consolidated Expanded Metal Cos., has been appointed district sales manager at Chicago for the Concrete Steel Co., succeeding WILLIAM PIEZ.

FRED S. SLATER, for a number of years associated with George D. Wetherill & Co., Inc., Philadelphia, has been made manager of the technical paint division of the M. J. Merkin Paint Co., Inc., New York.

C. W. HEPPENSTALL, president Heppenstall Forge & Knife Co., Pittsburgh, with Mrs. Heppenstall, sailed for Europe on Sept. 8.

WILLIAM H. COVERDALE, since 1913 associated with the Gulf States Steel Co., Birmingham, as consulting engineer and a director, has been elected president of the company, succeeding the late James Bowron. JOHN W. PLATTEN, who has been chairman of

W. H. COVERDALE

the finance committee, has been named to succeed Mr. Bowron as chairman of the board, and LESTER E. GEOHEGAN, for several years vice-president and general manager, has been made a director. Mr. Coverdale is a member of the consulting engineering firm of Coverdale & Colpitts, 52 Wall Street, New York, and has been active in the supervision of the improvement program that is being carried on by the Gulf States company. He was born at Kingston, Ont., in 1871, and attended the Collegiate Institute in that city and Geneva College, Beaver Falls, Pa., having been graduated from the latter institution in 1891. He served in the engineering department of the Pennsylvania Railroad for nine years and has since been engaged in consulting work. He is president of the Canadian Steamship Lines, Ltd., the Century Coal Co., the Midland Shipbuilding Co. and the Davie Shipbuilding & Repairing Co.; chairman of the Pierce Petroleum Corporation; vice-president and director of the Consolidation Coal Products Co., and a director in a number of banks, railroads and industrial companies. He is a member of the

American Society of Civil Engineers, the American Institute of Consulting Engineers, the American Iron and Steel Institute and the Engineers Club of New York.

LEIGH B. MORRIS, sales agent at Los Angeles for the Bethlehem Steel Co. and formerly district sales agent in New York for the Midvale Steel & Ordnance Co., has resigned.

ROBERT DONNER of the Donner Steel Co., Buffalo, sailed last week on the steamer Ile de France for a European trip.

AUGUST WILKS, for the last five years production manager of the Hoover Co., Canton, Ohio, has been made works manager of the Kearney & Trecker Corporation, Milwaukee. C. M. Cheadle, Jr., recently appointed advertising manager of the Milwaukee company, formerly served in a similar capacity with the Barber-Colman Co., Rockford, Ill.

H. A. DEFRIES, consulting metallurgist Ludlum Steel Co., Watervliet, N. Y., will address the Worcester, Mass., chapter of the American Society for Steel Treating, Thursday evening, Sept. 13, on "Recent Metallurgical Developments in France and Germany." He returned recently from a trip through those countries.

H. W. PETERS, for 12 years associated with the Packard Motor Car Co., Detroit, as office manager and later as general manager of the Detroit branch has been elected a vice-president of that company, in charge of distribution, to succeed Dr. Herbert H. Hills, who recently resigned.

GODOFREDO M. DE MENEZES, Caixa Postal 19, Rio de Janeiro, Brazil, is now spending a few weeks in the United States, largely on a commission to study the organization and construction of American highways. Road building is a major item of activity with the present president of Brazil, and the good roads movement appears to have become permanently popular. In 1929, probably in July, the next Pan-American highway congress will be held in Rio de Janeiro. Mr. Menezes, who is a graduate of Lehigh University, would undoubtedly welcome information regarding road construction and road building equipment.

J. J. MACKENZIE has been appointed manager of the engineering sales department of the Walworth Ohio Co., Cleveland.

J. STANLEY SEE, who has been production engineer of the industrial division of the Industrial Brownhoist Corporation, Bay City, Mich., has been made manager of the division.

R. L. RHOADS has been appointed dean of engineering at the University of Wyoming, Laramie.

Fabricated Structural Steel

Awards of 32,300 Tons—36,500 Tons in New Projects— New York Garment Building Takes 8100 Tons

AWARDS reported during the week amounted to 32,300 tons, the largest of which was for 8100 tons for a garment building in New York. New projects totaling 36,500 tons, included 9325 tons for a New York water tunnel and 8000 tons for a commercial building in Philadelphia. Awards follow:

WALTHAM, MASS., 350 tons, hospital, to A. L. Smith Iron Works.
GREENFIELD, MASS., 175 tons, theater, to Palmer Steel Co.
STATE OF VERMONT, 300 tons, bridges, to American Bridge Co.
NEW YORK, NEW HAVEN & HARTFORD RAILROAD, 140 tons, bridge work, to Shoemaker Bridge Co.
NEW YORK, 8100 tons, Garment Center at Seventh Avenue and Thirty-eighth Street, to Levering & Garrigues Co.
NEW YORK, 3000 tons, unit 7 of Tudor City development at 320 East Forty-second Street, to Harris Structural Steel Co.
NEW YORK, 800 tons, apartment building in East Seventy-second Street, to Harris Structural Steel Co.
NEW YORK, 450 tons, fur warehouse in West Twenty-eighth Street, to A. E. Norton, Inc.
NEW YORK, 250 tons, building for Rockefeller Institute of Medical Research, to Hedden Iron Construction Co.
STATE OF NEW YORK, 600 tons, highway bridges, to unnamed fabricators.
NEW YORK, 1380 tons, building at Sixty-ninth Street and Central Park West, to Hinkle Iron Works.
GRANVILLE, N. Y., 200 tons, high school, to McClintic-Marshall Co.
KEARNY, N. J., 2500 tons, factory building for Western Electric Co., Inc., to McClintic-Marshall Co.
MOBILE, ALA., 350 tons, new mill for Rome Wire Co., to Ingalls Iron Works Co.
ALTOONA, PA., 1100 tons, West Side High School, to Jones & Laughlin Steel Corporation.
SEWICKLEY, PA., 350 tons, Sewickley Valley Hospital, to Jones & Laughlin Steel Corporation.
AKRON, OHIO, 4000 tons, factory building for B. F. Goodrich Co., to Berger Iron Works.
MIDDLETOWN, OHIO, 290 tons, factory for Gardner-Harvey Paper Co., to Dayton Structural Steel Co.
MANSFIELD, OHIO, 300 tons, Richland Bank, to Forest City Structural Co.
LOUISVILLE, KY., 500 tons, plant for Mengel Body Co., to Louisville Bridge & Iron Co.
GREENCASTLE, IND., 100 tons, gas storage tank, to Stacey Mfg. Co.
PENDLEVILLE, IND., 100 tons, gas storage tank, to Stacey Mfg. Co.
FLINT, MICH., 450 tons, machine shop for Chevrolet Motor Co., to Flint Structural Steel Co.
FORDSON, MICH., 900 tons, grade crossing elimination, to American Bridge Co.
LASALLE, ILL., 250 tons, building for Marquette Cement Mfg. Co., to Mississippi Valley Structural Steel Co.
EAST CHICAGO, IND., 2500 tons, United States Gypsum Co. building, to American Bridge Co.
CHICAGO, 300 tons, catenary structures for Illinois Central Railroad, to Continental Bridge Co., local.
CHICAGO, 500 tons, bridge over Forty-third Street, to Mount Vernon Bridge Co.
OLYMPIA, 444 tons, Nugents bridge, to Pacific Car & Foundry Co., previously reported to unnamed fabricator.
SEATTLE, 210 tons, Boeing Airplane plant, to Austin Co.

SAN FRANCISCO, 535 tons, hotel, Geary and Maggie Streets, to McClintic-Marshall Co.
SAN FRANCISCO, 150 tons, apartment building at Leavenworth and Gough Streets, to Golden Gate Iron Works.
POMONA, CAL., 600 tons, exposition building for Los Angeles County, to McClintic-Marshall Co.
LOS ANGELES, 432 tons, bridge over Los Angeles River at Glendale Boulevard for Pacific Electric Railway, to McClintic-Marshall Co.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

NEW YORK, 9325 tons, including 3625 tons of plates, tunnel for Board of Water Supply; bids Sept. 25.
NEW YORK, 2000 tons, George Washington Hotel at Lexington Avenue and Twenty-third Street.
STATE OF NEW JERSEY, 350 tons; 225 tons for railroad bridge at North Bergen township, and 125 tons for bridge over Meeker Avenue, Newark.

REINFORCING STEEL

New York Water Tunnel Will Take 2850 Tons

INCLUDING 2850 tons for a water tunnel in New York and 1000 tons for an automobile garage and service station in the same city, new projects reported during the last week totaled 6300 tons. The following awards, amounting to 2950 tons, include no jobs of outstanding size:

NEW YORK, 160 tons, anchorages for Hudson River bridge, to Buffalo Steel Co.
ROCKAWAY, BEACH, N. Y., 350 tons, board walk; from Montrose Contracting Co., general contractor, to E. T. Edwards, Columbia, Pa.
BUFFALO, 125 tons, Union Road, to a local maker.
BUFFALO, 200 tons, superstructure for Rand Building, to a local maker.
CHICAGO, 650 tons of rail steel bars, office and store building at Michigan Avenue and Grand Avenue, to Calumet Steel Co.
CHICAGO, 255 tons of rail steel bars, apartment building at 1032 North Dearborn Street, to Calumet Steel Co.
STATE OF ILLINOIS, 250 tons of rail steel bars, road work, to Calumet Steel Co.
CHICAGO HEIGHTS, ILL., 100 tons, public school, to Calumet Steel Co.
WESTLEY, CAL., 210 tons, West Stanislaus Irrigation District, to Pacific Coast Steel Co.
SEATTLE, 250 tons additional for Frederick & Nelson warehouse, to Pacific Coast Steel Co. and Northwest Steel Rolling Mills.
SEATTLE, 250 tons, addition to Peck & Hills Furniture Co. warehouse, to Northwest Steel Rolling Mills.
TACOMA, WASH., 175 tons, Cushman spillway, to Northwest Steel Rolling Mills.

PHILADELPHIA 700 tons, "out patients" building and laboratory for University of Pennsylvania.

PHILADELPHIA 8000 tons, commercial building at Callowhill Street for Reading Co.

WILDWOOD, N. J., 400 tons, "Fun Chase" pier, bids in.

WASHINGTON, 250 tons, three 75-ft. girder spans for M Street bridge.

ERIE, PA., tonnage unstated, Erie County courthouse.

ROCHESTER, N. Y., 200 tons, building for Rochester Trust & Safety Deposit Co.

AKRON, OHIO, 5000 tons, building for Goodyear Tire & Rubber Co.

CINCINNATI, 125 tons, Roger Bacon High School.

DAYTON, OHIO, 600 tons, factory addition for Leland Electric Co.

INDIANAPOLIS, 600 tons, addition to building for Big Four Railroad.

INDIANAPOLIS, 500 tons, Majestic Building.

DECATUR, ILL., 2500 tons, office building.

CHICAGO, 2500 tons, Patterson Estate Building, American Bridge Co., low bidder.

CHICAGO, 1000 tons, power house for University of Chicago; Lakeside Bridge & Iron Co., Milwaukee, low bidder.

STATE OF ILLINOIS, 500 tons, highway bridges.

OLYMPIA, WASH., 120 tons, Coweeman River bridge; bids opened.

OLYMPIA, 230 tons, Kalama River bridge; bids opened.

SEATTLE, 130 tons, Pacific Coast Cement Co. plant; bids being taken.

SAN FRANCISCO, 1500 tons plates and shapes, five 80,000-bbl. tanks for Shell Oil Co.; bids being taken.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

NEW YORK, 2850 tons, water tunnel from Yonkers to Brooklyn for Board of Water Supply; bids Sept. 25.
NEW YORK, 1000 tons, Packard garage and service station at Eleventh Avenue and Fifty-fourth Street.
NEW YORK, 500 to 600 tons, Government barracks on Governor's Island.
NEW YORK, 340 tons, subway Section 5, route 107; Necaro Co., Inc., low bidder on general contract.
NEW YORK, 110 tons, miscellaneous work in Mott Haven yards of New York, New Haven & Hartford Railroad; Babor-Comeau & Co., Inc., general contractor.
BUFFALO, 375 tons, bridge over Eighteen-Mile Creek; Peckham Construction Company, low bidder.
DUNKIRK, N. Y., 400 tons; sewage disposal plant and seawall; bids opened Sept. 15.
CLEVELAND, 300 tons, building for W. S. Tyler Co.
ST. LOUIS, 250 tons, hotel at Twelfth Boulevard and Locust Street; McKelvey-Carter Construction Co., general contractors.
LOS ANGELES, 165 tons, Verdugo Wash storm drain; Soule Steel Co., low bidder.

110,000-Ton Pipe Line Order Placed

The A. O. Smith Corporation, Milwaukee, will fabricate by its electric welding process about 110,000 tons of 24-in. pipe for a gas line to run from Amarillo, Tex., to Omaha, Neb.

Machinery Markets and News of the Works

Machine Tool Volume Holds

Sales Slightly Lower in Some Districts Than in August
But This Is Offset by Gains Elsewhere

MACHINE tool business is holding at a fairly steady level. Slight losses in some districts, compared with August sales, are offset by gains in others. In addition, prospects, as represented by the amount of new inquiry, promise sustained fall activity.

It is expected that the latter half of September will bring larger orders, since many inquiries have been quoted on in the last 30 days, and a large proportion of these are still pending. Diversification of buying is gratifying to machine tool builders, many of whom are planning on keeping production schedules at the present level for some time.

The demand for presses has been exceptionally good in the Cleveland district, owing to the continued heavy demands for pressed metal parts from the automobile industry. The Midland Steel Products Co. has added a large number for two additional lines of manufacture in its Cleveland

plant and for enlarging the frame and shock absorber departments of its Detroit plant. The Central Mfg. Co., Connersville, Ind., has placed a \$75,000 order for presses to be used for automobile body stampings.

Business from the railroads is assuming larger proportions at Chicago. The Chicago, Milwaukee, St. Paul & Pacific have issued a sizable list, while the Chicago, Burlington & Quincy, which has just closed on a small list, has issued an additional inquiry for three 36-in. shapers. The Chicago, Rock Island & Pacific has also been a buyer of tools.

Demand for equipment in the Chicago district comes largely from manufacturers of tractors, agricultural implements and machinery and radios. The Nash Motors Co. is planning on replacements of machines at its three Wisconsin plants.

The Cleveland Board of Education will take bids until Sept. 17 on about 30 metalworking and woodworking machines for several Cleveland schools.

American Cyanamid Co., 535 Fifth Avenue, New York, has begun an expansion and improvement program at its plant at Niagara Falls, Ont., including installation of new machinery, to cost over \$250,000.

International Motor Car Repair & Machine Co., 614 East Eighty-third Street, New York, has leased part of building at 503 East Seventy-second Street for expansion.

Westchester Lighting Co., Mount Vernon, N. Y., has authorized expansion and betterment program during remainder of year to cost about \$2,000,000, including extensions in stations and lines at Ossining, to cost \$500,000; Port Chester, to cost \$500,000; Mamaroneck, to cost \$475,000, and other districts. An equipment distributing and service building, with repair facilities, will be built at Rye to cost about \$100,000, and a similar structure at Ossining, to cost close to like amount.

Waterfront Service Corporation, 26 Court Street, Brooklyn, plans installation of elevating, conveying and other handling equipment in new warehouse and docks, for which plans will be prepared by Moores & Dunford, Inc., 110 East Forty-second Street, architect and engineer, to cost more than \$400,000.

Nostrand Mfg. Co., Plattsburg, N. Y., recently organized by officials of Saranac Pulp & Paper Co., will take over local

mill of last noted company and plans expansion, including addition to paper mill, new pulp mill and new steam power plant, latter to include automatic stoking and coal-handling equipment, etc. Work is reported to cost more than \$175,000 with equipment. H. P. G. Nostrand, president of Saranac company, heads new organization.

Nash Queens' Motor Co., Long Island City, local representative for Nash automobile, has plans for three-story service, repair and sales building, 125 x 170 ft., to cost over \$200,000 with equipment.

Direct Control Valve Co., 101 Park Avenue, New York, has purchased plant and business of Lawler Water Feed & Damper Regulator Co., Mount Vernon, N. Y., and will consolidate with its organization. It is proposed to remove Mount Vernon plant to Milwaukee, where it will be consolidated with works of Milwaukee Valve Co., an affiliated organization, and which specializes in mechanical parts for valves; assembly plant of acquired organization will also be located in Milwaukee. James G. and Joseph G. Lawler, heretofore heads of Lawler company, will be connected with purchasing company.

Brooklyn Union Gas Co., 176 Remsen Street, Brooklyn, has filed plans for a three-story mixing plant to cost \$125,000 with equipment.

Liquidometer Co., Inc., Thompson Avenue, Long Island City, manufacturer of long-distance direct reading liquid gages and kindred specialties, has been acquired by new interests which will reorganize company and carry out expansion program.

Lighthill Corporation, 150 East Forty-first Street, New York, T. A. Meyer in charge, has plans for multi-story automobile service, repair and garage building, to cost more than \$500,000 with equipment.

Art Metal Works, 7 Mulberry Street, Newark, has taken bids on general contract for two-story addition, to cost about \$40,000 with equipment. Henry Baechlin, 665 Broad Street, is architect.

DeForest Radio Co., 139 Franklin Street, Jersey City, N. J., is carrying out an expansion program, including remodeling of equipment and installation of additional machinery.

Wright Aeronautical Corporation, Railway Avenue, Paterson, N. J., has awarded general contract to J. W. Ferguson Co., 152 Market Street, for a new two-story foundry, to cost more than \$225,000 with equipment.

New England

BOSTON, Sept. 10.—Although many machine tool houses report no improvement in business, more machines have been sold in New England since Labor Day than in the previous two weeks. Fully 90 per cent of the past week's business was transacted in west-

New York

NEW YORK, Sept. 11.—The volume of machine tool business the first 10 days of September showed no gain over the August rate, but orders and inquiries continue in satisfactory number, and prospects for a steady demand during the fall appear promising. The General Electric Co. has issued inquiries for a few additional machines for its refrigerator department. The Texas Corporation is in the market for a few tools. The New York Central continues to inquire for single machines. A railroad has ordered a 48-in. carwheel boring machine.

Sales of Pratt & Whitney Co. in the past week included five new and two used lathes, 6-spindle deep-hole drilling machine, four jig borers, 6-in. vertical shaper, 30-in. vertical profiler, 5-in. production hand miller. Miscellaneous sales were three Morris radial drills, two Cincinnati high-speed tapping machines and an 18-in. x 20-ft. gap lathe.

Plans have been filed by Columbia Metal Box Co., Ryder Avenue and 142nd Street, New York, for two-story addition to cost about \$100,000 with equipment. George A. Bagge & Sons, 157 East Forty-fourth Street, are architects.

The Crane Market

BUSINESS in overhead and locomotive cranes continues limited, and only a small volume of new inquiry is in the market. One overhead crane builder has been quite active recently, and in the past ten days has received orders for eight electric cranes, of which six were from one buyer in Philadelphia.

Among recent purchases are:

New England Power & Construction Co., Worcester, Mass., 25-ton standard locomotive crane from American Hoist & Derrick Co.

Passaic Valley Sewer Commission, New-

ark, N. J., 25-ton standard locomotive crane from McMyler-Interstate Co.

M. W. Kellogg Co., Jersey City, N. J., 12-ton crawl-tread crane for export from American Hoist & Derrick Co.

E. I. du Pont de Nemours & Co., Wilmington, Del., 1½-cu. yd. bucket crane from a builder in the Middle West.

De La Vergne Machine Co., Philadelphia, 10-ton, 58-ft. 6-in. span, 40-ton, 56-ft. 11-in. span, 20-ton, 38-ft. span, 10-ton, 36-ft. 8-in. span and 10-ton, 35-ft. span electric traveling cranes from Niles Crane Corporation.

Spang, Chalfant & Co., Inc., Pittsburgh, one 6-ton, 77-ft. span overhead electric traveling crane for Economy, Pa., works from Alliance Machine Co.

United States Gypsum Co., Chicago, one 4-motor, 4-yd. bucket crane from Cleveland Crane & Engineering Co., and two 4-motor, 3-yd. bucket cranes from Whiting Corporation.

Emerson Brantingham Co., Rockford, Ill., one 3-ton, 3-motor, 47-ft. span and one 3-ton, 3-motor, 21½-ft. span overhead electric traveling crane from Alfred Box Co.

ern New England and included lathes, jig boring equipment, drilling machines and a milling machine. The largest individual sale of used tools was four presses to a Philadelphia dealer.

New England railroads are working on 1929 budgets, but it is not likely that they will purchase a great deal of equipment. Many New England plants are securing considerable automobile work, and shops in general are better employed than in many months.

Small tools are moving freely. August sales by the largest makers were better than those in July, and made a new high record for 1928.

Bethlehem Shipbuilding Corporation, Ltd., Quincy, Mass., is making alterations to one of its East Boston shops.

Miller & Levi, 46 Cornhill, Boston, architects, are taking bids on a one-story addition for Joseph Pollack Tool & Stamping Co., 81 Freeport Street, Dorchester district, Boston.

Edward T. P. Graham, 171 Newbury Street, Boston, architect, has revised plans for a municipal pumping station for Cambridge, Mass. J. J. Scully is chairman of city water board.

Albert Kahn, Inc., 1000 Marquette Building, Detroit, architect, is revising plans for a sales and service station for Packard Motor Car Co., 1089 Commonwealth Avenue, Boston.

Charles D. White Co., 208 Purchase Street, Boston, has been made factory representative of United Metal Box Co., Brooklyn, steel medicine and other cabinets.

Plans are being drawn by New Departure Mfg. Co., Bristol, Conn., manufacturer of ball bearings, etc., for one-story addition to forge shop, 125 x 200 ft., to cost about \$100,000 with equipment.

Stacy Machine Works, West Springfield, Mass., manufacturer of upright drills and other tools, is removing from Taylor Street to a factory on Memorial Avenue where capacity will be increased.

Connecticut Power Co., New London, Conn., has plans for a three-story equipment storage and distributing plant, 75 x 200 ft., at Waterford, Conn., with repair department, to cost about \$100,000 with machinery. L. H. Goddard, 85 State Street, is architect.

New England Power Association, Worcester, Mass., has plans for early construction of power dams, power stations and other work in connection with hydroelectric power project on Connecticut River, near Monroe, N. H., and Barnet, Vt. It is purposed to provide equipment for output of 250,000 hp., with cost more than \$30,000,000, including steel tower transmission lines. Project will

be carried out by Connecticut River Development Co., a subsidiary organization.

Seth Thomas Clock Co., Thomaston, Conn., has plans under advisement for additions to replace several old factory buildings, and will increase capacity with installation of new equipment. Work is nearing completion on a four-story addition to main plant, costing more than \$100,000.

Crandall Engineering Co., East Boston, manufacturer of mechanical products, has plans for new two-story plant at Cambridge, to cost over \$35,000, with equipment.

E. E. Hilliard Co., Buckland, Conn., has approved plans for a water power and hydroelectric station at its local woolen mill, to cost over \$100,000 with equipment. Charles T. Main, Inc., 201 Devonshire Street, Boston, is engineer.

Philadelphia

PHILADELPHIA, Sept. 11.—Strawbridge & Clothier, Eighth and Market Streets, Philadelphia, department store, has awarded general contract to Nelson Pedley Construction Co., 1510 Chestnut Street, for two-story storage and distributing plant, including automobile service and garage division, to cost \$250,000. Abbott, Merkt & Co., 175 Fifth Avenue, New York, are architects and engineers.

David B. Flower, operating a railroad supply business at 1217 Spring Garden Street, Philadelphia, has organized D. B. Flower Mfg. Co., to manufacture electric appliances, parts, mechanical devices, etc. It is understood that new company will take over and expand present works. J. Struthers Dunn, 112 East Gowen Avenue, Mount Airy, Pa., and William C. Lex, Jenkintown, Pa., are interested.

Girard Smelting & Refining Co., Tioga and Richmond Streets, Philadelphia, recently organized to take over company of same name, has purchased property of Tacony Steel Co. for \$432,500 for a new works.

Philadelphia Gas Works, 1401 Arch Street, Philadelphia, operated by United Gas Improvement Co., same address, has plans for new artificial gas plant, with storage and distributing facilities, to cost about \$1,000,000. United Engineers & Constructors, Inc., 1401 Arch Street, is engineer.

Bids will soon be asked by Reading Co., Reading Terminal, Philadelphia, for ten-story and basement commercial, storage and distributing building, 225 x 500 ft., with service, repair and garage division to provide facilities for about 600 automobiles. Project will cost about \$3,000,000. Clark Dillenback is company architect.

Penn-Jersey Steel Co., 1450 Ferry Avenue, Camden, N. J., has awarded general contract to Herman Schestack, 631 South Sixty-third Street, for one-story addition, 65 x 166 ft.

Atlas Powder Co., Wilmington, Del., is planning erection of new nitrate plant at works at Reynolds, Pa., to cost about \$400,000 with equipment.

Pennsylvania Gas & Electric Corporation, York, Pa., has arranged for a bond issue of \$2,500,000, a portion of proceeds to be used for extensions and improvements, including transmission line construction. H. A. Clarke is vice-president.

E. F. Houghton & Co., 240 West Somerset Street, Philadelphia, refined oils, is having plans drawn for a three-story addition, to cost over \$60,000. Austin Co., 1015 Chestnut Street, is architect and engineer.

B. Edmund David, Inc., Scranton, Pa., operating a silk mill, is said to be planning installation of power station and machine shop in proposed new plant, project to cost over \$300,000 with machinery.

Columbia Malleable Castings Co., Columbia, Pa., has awarded general contract to John H. Wickersham, Columbia, for one-story addition, 320 x 360 ft., to cost more than \$200,000 with equipment. Lothar R. Zifferer is president.

Philadelphia & Reading Coal & Iron Co., Reading Terminal, Philadelphia, is planning an expansion and betterment program at its coal properties, including construction of about seven new breakers, with mechanical and electrical equipment, remodeling several existing breakers, consolidation of collieries, and installation of coal-mining and other operating machinery.

Automatic Appliances, Inc., 3145 North Broad Street, Philadelphia, has been organized to distribute specialized heating products, including automatic anthracite coal burners, electric refrigeration equipment, etc., and, for the present, will not enter manufacturing field.

South Atlantic

BALTIMORE, Sept. 10.—Following organization of Albemarle-Chesapeake Co., Inc., West Point, Va., to take over and consolidate Albemarle Paper Mfg. Co., Richmond, Va., and Chesapeake Corporation, West Point, plans have been authorized for new mill adjoining plant of last-noted company at West Point, to be equipped for kraft and other heavy paper production. It will include power house, machine shop and other units. A fund of more than \$1,250,000 is being arranged for mill. H. W. Ellerson is president of consolidated company.

Board of Education, Baltimore, is considering installation of manual training equipment in new Northeast junior high school to cost about \$500,000, for which plans will be drawn by William W. Emmart, Union Trust Building, architect.

Board of District Commissioners, District Building, Washington, will receive bids until Sept. 18 for one portable gas-driven air compressor; until Sept. 19 for equipment for cafeteria for public schools, including dish-washing machines, trucks, 828 wire stools, etc.

Conveying equipment, power and refrigerating and other machinery will be installed in new packing plant to be built by J. Phillips Sausage Co., 10 Wholesale Row, Washington, to cost about \$200,000. Henschien & McLaren, 637 Prairie Avenue, Chicago, are architects and engineers.

General Purchasing Officer, Panama Canal, Washington, will receive bids until Oct. 2 for six-cylinder marine type gasoline engines, machine screws, malleable iron pipe fittings, brass pipe fittings, soldering irons, bolts, steel wire foundry brushes, and other equipment, Panama circular 1901.

Summers Fertilizer Co., Stock Exchange Building, Baltimore, has awarded general contract to Austin Co., Cleveland, for new super-phosphate mill, to cost about \$180,000 with machinery.

City Council, Petersburg, Va., has authorized construction of municipal airport in vicinity of Lee Park, to include hangars, repair and reconditioning shops, oil storage and distributing buildings, to cost more than \$75,000. City engineering department is in charge.

Ovens, power equipment, conveying and other machinery will be installed in new plant to be built by Waldensian Bakery Co., Valdese, N. C., to cost about \$100,000. Martin L. Hampton, Congress Building, Miami, Fla., is architect.

Perel's Fixture Exchange, 241 Harrison Street, Baltimore, store fixtures, etc., will soon take bids on general contract for three-story storage and distributing plant, to cost about \$45,000 with equipment. John Freund, 1307 St. Paul Street, is architect.

Collins Durax Co., Salisbury, N. C., is planning purchase of centrifugal pumping equipment and accessories.

Seeley-Peteet Pipe Fabricating Co. has moved into its new plant at 322 North Highland Avenue, Atlanta, for fabricating piping for power plants, heating and plumbing work and industrial plants, and for pipe and other oxy-acetylene welding. James Cannon is superintendent.

Buffalo

BUFFALO, Sept. 10.—Arrangements have been made by Kelker Blower Co., 2383 Fillmore Avenue, Buffalo, manufacturer of blower equipment, sheet metal products, etc., for purchase of one-story factory, 60 x 200 ft., at 19 Bush Street. Improvements will be made and present works removed to new location, with installation of additional equipment.

Stewart Motor Corporation, 93 Dewey Avenue, Buffalo, manufacturer of motor trucks, has work under way on extensions to increase output about 30 per cent, to cost about \$50,000 with equipment.

McKaig-Hatch, Inc., 595 Ontario Street, Buffalo, manufacturer of forgings, etc., has plans for a one-story addition.

Kittenger Furniture Co., 1893 Elmwood Avenue, Buffalo, has awarded general contract to Hydro Construction Co., Mu-

tual Building, for a three-story addition, to cost over \$200,000 with equipment.

Officials of Curtiss Aeroplane & Motor Co., Kail Street, Buffalo, have organized Curtiss Flying Service, Inc., to operate an airplane line between at least 25 cities. Plans are under way for establishment of airports, including hangars, repair and reconditioning shops, oil storage and distributing buildings and other units. Company will also operate service and repair stations, including parts and accessories. Arrangements are being made for sale of 750,000 shares of stock, to net more than \$8,000,000, proceeds to be used for construction noted, purchase of planes, etc. C. M. Keys, president of Curtiss company, will be chairman of board of new organization. Casey Jones will be president.

United Reproducers Corporation, Rochester, N. Y., is being organized to take over United Radio Corporation, with local factory, and Newcombe-Hawley Co., Inc., St. Charles, Ill. A preferred stock issue of \$2,475,000 is being arranged, part of fund to be used for completing merger and for expansion. Jesse Hawley, treasurer of last noted company, will head new organization.

Chicago

CHICAGO, Sept. 10.—Machine tool business from railroads is in larger proportions. The Chicago, Milwaukee, St. Paul & Pacific has issued a sizable list and the Chicago, Burlington & Quincy is inquiring for three 36-in. shapers following the closing of a small list. The Rock Island has also purchased tools on which it had taken prices. Lack of an appropriation is said to be holding in check purchases by the A. O. Smith Corporation, Milwaukee. Allis-Chalmers Mfg. Co. has set Sept. 15 as the closing date on its list. The Nash Motors Co. is planning replacements at its three Wisconsin works, and radio parts manufacturers are in need of machine tool equipment. Tractor builders are again entering the market, one order from that source being for two 6-ft. radial drills. Impression is uniform that sales in September will be good.

List of Chicago, Milwaukee, St. Paul & Pacific Railroad.

One 3½-in. turret lathe, with 220-volt direct-current motor.

One internal grinder for locomotive air pumps, with reverse gear cylinder attachment and motor.

One 32-in. crank shaper, with motor.

Two 32-in. heavy-duty crank shapers with motors.

One 20-in. railroad brass lathe with chasing bar.

Two 20-in. speed drill presses with motor.

One 3-ft. radial drill with motor.

One structural steel and miter shear, universal punch and coping machine.

Two 3½-in. semi-automatic turret lathes with motors.

One 30-in. x 18-ft. piston lathe with motor.

One 42 x 42-in. x 16-ft. heavy-duty planer with two rail heads and one side head, with reversing motors.

Two 3-post electric rivet heaters for rivets ⅝-in. to 1¼-in. by 1½-in. to 10-in.

One 3½-in. single bar screw machine with motor.

One 72-in. boring mill with motor.

One 42-in. motor-driven lathe, 10½-ft. centers.

One 4½-in. horizontal boring mill with motor.

Knapp Brothers, manufacturers of metal trim and building specialties, will move their plant from Cicero to Joliet,

Ill., and will erect a factory, 120 x 600 ft., to cost \$130,000.

Central Steel & Wire Co., Chicago, will build a one-story warehouse, 120 x 360 ft., at corner of South Western Avenue and West Forty-fifth Place, to cost \$200,000. W. S. Crosby is architect.

American Carton Corporation, 4936 South Rockwell Street, Chicago, will build an addition, 80 x 211 ft., to cost \$33,000. T. B. Jorgensen, 510 North Dearborn Street, is architect.

Illinois Public Service Co., 130 South Sixth Street, Cairo, Ill., is planning construction of a one-story ice manufacturing plant to cost \$75,000.

Bids have been asked on general contract by Okaw Stove & Enameling Co., New Athens, Ill., for a one-story plant, 80 x 200 ft., to cost about \$40,000 with equipment. W. C. Ross, 1015 East Monroe Street, Belleville, Ill., is head of company.

Standard Oil Co. of Indiana, 400 East Cerro Gordo Street, Decatur, Ill., plans new storage and distributing plant to cost about \$100,000 with equipment. Schlinz & Bailey, 53 West Jackson Boulevard, Chicago, are architects.

International Harvester Co., Chicago, has let contracts for additions to grinding building, steel storage and steel shearing departments at plow production plant, Canton, Ill., to H. K. Ferguson Co., Cleveland. Steel storage building will be one story, 32 ft. high, and will house large machinery. H. W. Bland is plant engineer. Contract has also been awarded to Kucharo Construction Co., Des Moines, for one-story factory branch, service and repair building, 95 x 170 ft., at Dubuque, Iowa, for motor truck division, to cost over \$70,000 with equipment.

M. L. Kraman, 134 North La Salle Street, Chicago, architect, has filed plans for three-story automobile service, repair and garage building, to cost about \$275,000 with equipment.

Mountain States Power Co., Basin, Wyo., will make extensions and improvements in power facilities and transmission lines to cost about \$150,000, including new line from Lovell to Gray Bull, Basin and vicinity, with automatic substation equipment. Headquarters are at Tacoma, Wash.

St. Louis

ST. LOUIS, Sept. 10.—City Council, Kirkwood, Mo., has engaged Burns & McDonnell Engineering Co., Interstate Building, Kansas City, Mo., engineer, to prepare plans for municipal electric power plant and system, to cost about \$200,000 with equipment.

Officials of Gardner Motor Co., Main and Rutger Streets, St. Louis, manufacturer of automobiles, are said to be arranging for organization of new company, with capital of \$2,000,000, to manufacture airplanes and parts.

City Council, Stanberry, Mo., will receive bids until Sept. 25 for equipment for municipal electric light and power plant, including Diesel engines and auxiliaries. Henrici-Lowry Engineering Co., 114 West Tenth Street, Kansas City, Mo., is engineer.

United States Cold Storage Co., 500 East Third Street, Kansas City, Mo., has plans for new six-story cold storage and refrigerating plant unit, to cost \$400,000 with equipment. A. Epstein, 2001 West Pershing Road, Chicago, is engineer.

Chicago, Burlington & Quincy Railroad

Co., 547 West Jackson Boulevard, Chicago, has filed plans for an electrically-operated coaling station at Kansas City, Mo., with capacity of 200 tons.

Board of Education, 400 North Walnut Street, Oklahoma City, Okla., plans installation of manual training equipment in new three-story senior high school to cost about \$450,000, for which superstructure will soon begin. Layton, Hicks & Forsyth, Braniff Building, are architects.

St. Louis Air Transport & Terminal Co., Boatman's Bank Building, St. Louis, P. E. Peltason, head, is having plans prepared for airport at East St. Louis, Ill., including hangars, repair and reconditioning shops, oil storage and distributing buildings, to cost over \$400,000. Love-Sultan, Inc., 6625 Delmar Boulevard, University City, Mo., is architect and engineer.

Cleveland

CLEVELAND, Sept. 10.—Machine tool business came out in moderate volume the past week with few orders for more than single tools. Demand is largely from the automotive field. Turret lathe manufacturers report a fair volume of orders, although sales are not quite as brisk as in the first part of August. Press equipment is active. The Midland Steel Products Co., Cleveland, has just purchased several presses for use in two additional production lines to its automobile frame department in its local plant and for enlarging the frame and shock absorber departments of its Detroit plant. Part of the expansion has been necessitated by a large export order for automobile frames. The Central Mfg. Co., Connersville, Ind., has purchased \$75,000 worth of press equipment to manufacture automobile body stampings.

The Cleveland Board of Education will take bids Sept. 17 for about 30 metal and wood-working machines and some miscellaneous equipment for several schools. The list follows:

- One 1-in. x 6-in. x 14-in. turret lathe.
- Two tool-room lathes.
- One 11-in. x 5-ft. lathe.
- One 12-in. floor grinder.
- One 10-in. sensitive drilling machine.
- One arbor press.
- One 14-in. drilling machine.
- One 6-in. combination grinder.
- One tumbling barrel, sand blast and dust arrester.
- One air compressor.
- One melting furnace.
- Three 12-in. x 7-ft. wood-working speed lathes.
- One 24-in. planer.
- Two 6-in. jointers.
- One utility type bench lathe.
- Two 14-in. band saws.
- One 30-in. band saw.
- Three universal bench saws.

Swartwout Co., 18511 Euclid Avenue, Cleveland, manufacturer of steam specialties, is planning a new one-story plant, to cost over \$125,000 with equipment, for which architect will be selected soon.

Board of Education, Chagrin Falls, Ohio, contemplates installation of manual training equipment in new high school to cost about \$375,000, for which plans will soon be completed by Fulton & Taylor, 8120 Euclid Avenue, Cleveland, architects.

Cleveland Wire Spring Co., 1281 East Thirty-eighth Street, Cleveland, has engaged George S. Rider Co., Century Building, architect and engineer, to prepare plans for one-story addition, 120 x 125

ft., to cost about \$80,000 with equipment. Part of structure will be used for storage and distributing.

Peerless Motor Car Corporation, East Ninety-third Street, Cleveland, has plans for a new one-story steam power house with coal storage and distributing facilities, including conveying, unloading and other equipment, to cost close to \$40,000. Wilbur Watson and Associates, 4614 Prospect Avenue, are architects and engineers.

Toledo Central Garages, Inc., Toledo, Ohio, care of Mills, Rhines, Bellman & Nordhoff, Ohio Building, architects, has plans for six-story service, repair and garage building, 110 x 200 ft., to cost about \$500,000 with equipment.

Transue & Williams Steel Forgings Corporation, Cleveland, has let contract to H. K. Ferguson Co. for additions to its Alliance, Ohio, plant.

Hill Clutch Machine & Foundry Co., Cleveland, has appointed following dealers: Harry P. Leu, Orlando, Fla., in southern Florida; Engineering Sales Co., Saginaw Mich., in thumb district of Michigan; F. C. Richmond Machinery Co., Salt Lake City, in Utah, Nevada, Idaho and Wyoming; Arthur E. Jones, Syracuse, N. Y., in western New York; Hollis & Co., Little Rock, Ark., in southern Arkansas, and San Antonio Machine & Supply Co., in southern Texas.

Cincinnati

CINCINNATI, Sept. 10.—Machine tool sales the first week of September showed a slight falling off from the August level, although bookings still continue exceptionally good. Usually the latter part of August and the first half of September are comparatively dull, because the heaviest effects of the vacation season are reflected in that period, but it has been distinctly different this year. As inquiries are fairly numerous and there are a considerable number of transactions which are reasonably certain to be closed soon, local builders expect September to be a satisfactory month from the standpoint of new orders. Diversified buying is an outstanding source of satisfaction to manufacturers who are planning to keep production at the present high level indefinitely.

LeBlond-Schacht Truck Co., Eighth and Evans Streets, Cincinnati, manufacturer of automobile trucks, has purchased equipment, good will, patents and other properties, other than real estate, of O. Armleder Motor Truck Co., Twelfth Street and Central Parkway. New corporation is to be formed, and equipment at Armleder plant will be moved to 3134 Spring Grove Avenue, property of LeBlond-Schacht Truck Co. Armleder company recently has been producing daily 12 heavy-duty motor trucks, ranging in capacity from 1½ to 5 tons.

Contract has been let by Variety Mfg. Co., 2901-3 West Third Street, Dayton, Ohio, manufacturer of spun metal products, to Hillsmith & Co., Winters National Bank Building, for one-story and basement addition, to cost about \$40,000 with equipment.

Richards, McCarty & Bulford, 584 East Broad Street, Columbus, Ohio, architects, have plans for a two-story automobile service, repair and garage building to cost about \$100,000 with equipment.

Liberty Blow Pipe Works, Louisville, has been purchased by G. L. Jackson, formerly plant engineer for Mengel Co.,

and associates, who will reorganize company and increase production facilities. New organization has arranged with Kirk & Blum Mfg. Co., Cincinnati, manufacturer of blowers, exhaust systems, etc., to use patents of that company in Louisville district.

Ohio Pattern Works, Colerain Avenue, Cincinnati, manufacturer of metal and wood patterns, has awarded general contract to D. Meinken & Sons, 2143 Barnard Street, for a four-story and basement addition, to cost about \$100,000 including equipment.

David Dermon, Dermon Building, Memphis, Tenn., and associates are negotiating purchase of site for six-story automobile service, repair and garage building, 148 x 150 ft., to cost over \$150,000 with equipment. George Awsumb, Dermon Building, is architect.

Springfield Metallic Casket Co., North Street, Springfield, Ohio, has taken bids on general contract for a five-story addition, 140 x 203 ft., to cost about \$175,000 with equipment. Eastman & Budke, First National Bank Building, is architect.

City Council, Chattanooga, Tenn., is considering a municipal airport and aviation field, with hangars, repair and reconditioning shops, oil storage and distributing buildings, entire project to cost about \$250,000. A bond issue is being arranged.

Milwaukee

MILWAUKEE, Sept. 10.—Not only are machine tool plants busy, with several operating overtime, but new business is developing satisfactorily, and the present rate of production seems assured for some time. Automotive demand is noteworthy despite heavy purchases in recent months. Foundry and machine shop employment in Milwaukee and vicinity is at the highest peace-time record, and the supply of machinists, machine hands and molders is very light, with an absorbing demand.

Seaman Body Corporation, Milwaukee, subsidiary of Nash Motors Co., Kenosha, Wis., will further enlarge its plant over a two-year period at a cost of \$2,000,000. Contracts are being awarded for first unit, a five-story wing, 100 x 385 ft., for production of steel body panels and body stampings. A battery of new stamping and drawing presses is being purchased. When this unit is completed, another wing of similar size will be built. It is also stated that plant of Seaman-Dunning Co., Pine Bluff, Ark., also a Nash subsidiary, will be enlarged to provide Seaman body works with increased hardwood stock.

Malleable Iron Range Co., Beaver Dam, Wis., manufacturer of kitchen ranges and other heating devices, has contracted with Hutter Construction Co., Fond du Lac, Wis., for a one-story factory warehouse building, 86 x 110 ft.

Welded Products Co., 851 Kinnickinnic Avenue, Milwaukee, manufacturer of steel joists and other welded building material and specialties, is erecting a new production unit, 60 x 120 ft., in Cudahy. The investment will be about \$35,000.

Wisconsin Power & Light Co., 16 North Carroll Street, Madison, Wis., will extend its artificial gas distributing system from Fond du Lac, Wis., to Beaver Dam, Wis., by way of Lamartine, Ripon and Waupun, and plans a 200,000 cu. ft. gas holder in Beaver Dam. E. J. Kallevang is chief engineer.

Hill & Hubbell Co., San Francisco, will rush work on a new plant in Milwaukee to replace leased quarters at Thirty-second and Hopkins Streets, destroyed by fire Sept. 4. Company manufactures and operates special machinery for covering electrically welded steel pipe made by A. O. Smith Corporation, Milwaukee. Two 60-ton cranes in one section of the building were badly damaged.

Gillette Rubber Co., 799 Wisconsin Avenue, Eau Claire, Wis., has started work on erection of a one-story tire and tube manufacturing addition, 50 x 135 ft.

Eastman Mfg. Co., Manitowoc, Wis., producer of hose couplings, is building a one-story addition, 40 x 60 ft.

David White Co., 315 Court Street, Milwaukee, manufacturer of surveying instruments and other optical specialties, has increased its capital stock from \$50,000 to \$75,000. Additional space is being taken in its building and some new equipment will be installed.

Durant Mfg. Co., 655 Buffum Street, Milwaukee, manufacturer of counting machines for production machinery, will invest about \$50,000 in building and equipping two additional stories on its present main shop, 60 x 120 ft.

American Metal Products Co., Thirty-fourth Avenue and Burnham Street, Milwaukee, manufacturer of bronze castings, is preparing to build an addition to its rolling mill, 50 x 120 ft.

Pittsburgh

PITTSBURGH, Sept. 10.—While machine tool sales are not large nor numerous, inquiry is brisk and is coming from sources which usually purchase after asking for bids.

Vulcan Crucible Steel Co., Aliquippa, Pittsburgh, has acquired five acres adjoining plant for future expansion.

Board of Education, Apollo, Pa., is said to be planning installation of manual training department in new three-story high school to cost \$200,000. A. L. Thayer, Greer Building, New Castle, Pa., is architect.

Oil City Tank Car Co., Oil City, Pa., recently organized by B. H. Mathias, Oil City, and associates, with capital of \$50,000, will operate local plant for manufacture of tank car equipment, oil refining apparatus, tanks and other specialties. L. D. Fulton and E. H. Leslie, both of Oil City, are interested in new company.

United States Engineer Office, Pittsburgh, will receive bids until Sept. 27 for repair parts for engines, circular 75. It is said bids will be asked early in October for lock-operated machinery for double locks at Deadmans Island dam, Ohio River, as per plans being drawn.

C. J. Kerin, Emsworth, Pittsburgh, and associates have organized Pittsburgh Eastern Air Lines, to operate a commercial flying service between Pittsburgh and Philadelphia by way of Harrisburg, including construction of airports at points noted, with hangars, repair and reconditioning shops, oil storage and distributing buildings. Work will begin soon.

Joint High School Board of Education, Barboursville, W. Va., is said to be planning installation of manual training facilities in new high school to cost more than \$175,000, for which bids on general contract for first unit will be received Sept. 19. William F. Diehl, Robson-Prichard Building, Huntington, W. Va., is architect.

Indiana

INDIANAPOLIS, Sept. 10.—Bids will soon be asked by Poinsett Brothers, 323 East Washington Street, Fort Wayne, for a one-story machine shop and service building, 50 x 150 ft., to cost about \$40,000 with equipment. Pohlmeier & Pohlmeier, Central Building, are architects.

Wheeler-Schebler Carburetor Co., Inc., 1302 Barth Avenue, Indianapolis, manufacturer of carburetors and automobile accessories, has engaged D. A. Bohlen & Son, Majestic Building, architects, to prepare plans for one-story addition, 130 x 140 ft., to cost about \$50,000 with equipment.

Motor Bodies, Inc., Evansville, subsidiary of Graham-Paige Motor Co., Detroit, has begun superstructure for one-story addition, 450 x 480 ft., to cost over \$650,000 with equipment.

Chicago & Eastern Illinois Railroad Co., 332 South Michigan Avenue, Chicago, has plans for new locomotive and car repair shops at Evansville, to cost about \$200,000 with equipment. L. C. Hartley, 6600 South Union Avenue, Chicago, is chief engineer.

Dodge Mfg. Corporation, Mishawaka, Ind., manufacturer of transmission equipment, etc., has plans for one-story addition, 100 x 200 ft., to cost close to \$45,000 with equipment.

United States Slicing Machine Co., La Porte, Ind., has begun work on an addition to increase capacity close to 40 per cent, to cost over \$200,000.

Bendix Brake Co., South Bend, has plans for brick and steel addition, 200 x 300 ft., to cost about \$10,000. It will be erected by H. G. Christman Co., South Bend.

Detroit

DETROIT, Sept. 10.—Plans are being completed by Detroit Gasket Mfg. Co., 6309 Hamilton Avenue, Detroit, for one and two-story addition, including boiler plant, to cost about \$50,000 with equipment. C. W. Brandt, 2111 Woodward Avenue, is architect.

Knight Screw Products Co., 6510 Epworth Boulevard, Detroit, has awarded general contract to Gallagher-Flemming Co., 6500 Epworth Boulevard, for one-story addition to machine shop to cost about \$25,000.

Crane Co., 836 South Michigan Boulevard, Chicago, has engaged Van Leyen, Schilling & Keough, 3440 Cass Avenue, Detroit, architects, to prepare plans for a one-story factory branch and distributing plant at Detroit, to cost over \$80,000 with equipment.

Wilder-Strong Implement Co., Monroe, Mich., is carrying out an expansion program to double, approximately, capacity. Additional equipment will be installed.

Pontiac Pattern & Engineering Co., Pontiac, Mich., has awarded general contract to Pryale Construction Co., Pontiac, for a foundry addition to cost about \$24,000. Robert O. Derrick, Inc., 120 Madison Avenue, Detroit, is architect.

Newaygo Portland Cement Co., Newaygo, Mich., is considering new mill in vicinity of Charlevoix, Mich., with power house, machine shop and other buildings, to cost about \$1,000,000 with equipment.

Chevrolet Motor Corporation, Flint, Mich., has awarded general contract to H. G. Christman Co., Lansing, Mich., for a two-story addition, 200 x 240 ft., primarily for assembling, to cost over \$180,000 with equipment.

Bennett Pump Corporation, Terrace Street, Muskegon Heights, Mich., manufacturer of pumps and pumping machinery, is having plans drawn for an addition to total about 22,600 sq. ft. floor space, to cost close to \$55,000 with equipment.

Hupp Motor Car Corporation, Detroit, has begun construction of a new unit to main plant. Building will be eight stories, 150 x 200 ft., and will include shipping docks and trackage and accommodate engineering department on top floor. Other floors will be utilized for car storage.

Gulf States

BIRMINGHAM, Sept. 10.—William E. Easterwood, Jr., Baker Hotel Building, Dallas, Tex., is at head of project to construct a plant to manufacture aircraft, with initial unit largely for parts and assembling.

Texas Co., Texas Co. Building, Houston, Tex., is reported planning new oil refinery in southwestern part of State. Project will include construction of pipe line from properties in Winkle County to refinery, and will cost over \$500,000.

Martin-Navarro Co., Frost Bank Building, San Antonio, Tex., has awarded general contract to Walsh & Burney, Inc., 928 Flores Street, for one and two-story motor bus service, repair and terminal building, to cost about \$115,000 with equipment.

Trinity Portland Cement Co., Fort Worth, Tex., will make extensions and improvements in mill to double capacity, to cost about \$500,000 with machinery.

Phillips Petroleum Co., Bartlesville, Okla., has authorized new gasoline refinery near McCamey, Tex., to cost about \$450,000 with machinery.

New Orleans Parish School Board, City Hall, New Orleans, is planning installation of manual training equipment in new three-story school to cost about \$275,000, for which bids have been asked on general contract. E. A. Christy, City Hall, is school architect.

Ovens, power equipment, conveying machinery and other equipment will be installed in new two-story and basement baking plant, 100 x 120 ft., to be built by Arnot Baking Co., 401 East Third Street, Jacksonville, Fla., to cost about \$115,000.

Pacific Coast

SAN FRANCISCO, Sept. 6.—Little Rock Power & Water Co., Los Angeles, affiliated with Southern Sierras Power Co., Riverside, Cal., has secured permission for a hydroelectric power development on Little Rock Creek, Los Angeles County, to cost about \$600,000, including power dam and transmission line. Output will be used by Southern Sierras company.

Marchetti Motor Patents, Inc., Russ Building, San Francisco, recently formed by Paul Marchetti and associates, is having plans drawn for aircraft manufacturing plant at South San Francisco, consisting of two one-story units, totaling 28,000 sq. ft. and 68,000 sq. ft., for airplane motor production, and aircraft parts manufacture and assembling, respectively. Project will cost close to \$275,000 with machinery. A. W. Ryder is company engineer, in charge.

Flagstaff Gas Co., Flagstaff, Ariz., has plans for a new artificial high pressure gas plant, to cost close to \$190,000 with equipment.

Shell Oil Co., Lloyd Building, Seattle, has awarded general contract to Strandburg & Robinson, Arcade Square, for a two-story machine shop, 60 x 120 ft., with one-story and basement automobile service and garage building, 60 x 135 ft., on adjoining site, project to cost about \$85,000 with equipment.

Olympic Motor Boat Co., 5915 Marginal Way, Seattle, is said to have plans for extensions for building aircraft, including seaplanes, with facilities for parts manufacture and assembling.

Swift & Co., Union Stock Yards, Chicago, and Los Angeles, have awarded general contract to Richards-Neustadt Construction Co., W. M. Garland Building, for oil refinery in Vernon section, to cost about \$140,000 with machinery.

Richfield Oil Co., Matson Building, San Francisco, has plans for new storage and distributing plant in Squalicum Creek Basin section, Bellingham, Wash., to cost about \$100,000 with equipment.

Pacific Galvanizing Co., 1711 East Sixty-first Street, Los Angeles, has been formed to do galvanizing-electro and hot-cadmium plating and sand blasting. Company has plant completely equipped.

Hallett Aero Motors Corporation, 523 South Redondo Boulevard, Inglewood, Cal., has been organized to manufacture airplane engines. It has been operating foundry and machine shops for manufacture of air compressors and marine engines and additional capacity will be constructed to take care of its new line.

Canada

TORONTO, Sept. 10.—Business in machine tools has been more active the past two weeks than at any time since the first of July. Much of the improvement is due to sales at the Canadian National Exhibition which closed Sept. 8. A considerable volume of business is in prospect for closing within the next six weeks, and dealers and builders look for high average sales for this month. A steady demand is reported for tools for automotive plants, garages and repair shops.

Eastern Car Co., Amherst, N. S., is making some changes in its plant and is asking for a few special tools. Steel Co. of Canada, Ltd., Hamilton, Ont., and Algoma Steel Corporation, Sault Ste. Marie, Ont., are expected to enter market soon with some large lists.

Beach Foundry, Ltd., Ottawa, Ont., will issue 7 per cent cumulative preferred stock, fund to be used for plant improvement and to finance its increasing business. Company manufactures stoves, furnaces, heaters, ranges, etc.

General Steel Wares, Ltd., Toronto, has secured a site at North Bay, Ont., for a branch plant for assembly, distributing and warehouse.

Ford City, Ont., Cyril Fraser, councillor, is contemplating erection of a new waterworks pumping station to cost \$80,000.

Bids are being received by Bates Valve Bag Co., Ltd., head office, Walker Power Building, Walkerville, Ont., manufacturer of automatic bag filling and weighing machinery, no closing date set, for erection of a factory at its branch plant at Cap de la Madeleine, Que., to cost \$100,000. Building to be one story, 80 x 200 ft., brick construction.

Canada Cement Co., Canada Cement Building, Montreal, will make alterations and additions to its plant at Hull, with installation of new machinery, to cost \$500,000.

Canadian International Paper Co., 1153 Notre Dame Street, Montreal, is having plans prepared for a paper mill at Paugan Falls, Que.

Chrysler Motor Car Co., Windsor, Ont., contemplates building another addition to its plant at Tecumseh and McDougall Streets.

Arco Paint & Varnish Co., Toronto, Ont., will start work immediately on a manufacturing plant at Mount Dennis, Ont.

Western Canada

Murray-Latta Machine Works, Vancouver, B. C., has awarded contract to Dominion Construction Co., Ltd., 509 Richards Street, for a machine shop and boiler house, one story, 50 x 122 ft. S. A. Lake, 509 Richards Street, is architect.

Foreign

OFFICIALS of Anglo Smelting & Refining Co., London, England, G. P. Lewis, president, have organized Anglo-American Nickel Co., a subsidiary, to develop a deposit of nickel in northern part of Arizona. A reduction plant is planned. Project is reported to cost more than \$200,000.

Mexican National Railways Co., Mexico City, Mexico, is said to be planning an extension and improvement program for locomotive and car shop facilities, including removal of four existing shops in different cities to other locations, where capacities will be increased.

Corn Products Refining Co., 17 Battery Place, New York, with mills at Edgewater, N. J., Argo and Pekin, Ill., is said to be considering construction of a new plant in Brazil, as well as new mill in Japan. Arrangements have recently been made for a plant in Argentina.

Department of Communications and Public Works, Mexican Government, Mexico City, Mexico, is planning construction of new airport, including four hangars, each with capacity for housing 15 planes, repair and reconditioning shops, oil storage and distributing buildings, to cost over \$120,000.

State Department, Government of Bolivia, La Paz, has approved plans for construction of first section of its railroad project, comprising first 100 miles of track between Cochabamba and Santa Cruz, a total distance of 350 miles, with car and locomotive shops, yards, terminal facilities, etc., project to cost \$35,000,000. General contract has been let to Kennedy & Carey, 44 Wall Street, New York.

A steel company at Newcastle, New South Wales, Australia, is planning expansion in its mills, with installation of considerable additional equipment; a new coke oven unit is planned. Project is reported to cost about \$5,000,000 with machinery. Information at office of Bureau of Foreign and Domestic Commerce, Washington, reference Australia No. 9-3-28.

Plans have been approved for a new cold storage and refrigerating plant at Stavropol, Russia, under direction of Soviet Government, to cost more than \$200,000 with equipment. Information at office of American-Russian Chamber of Commerce, 145 West Fifty-seventh Street, New York.

Ford Motor Co., Highland Park, Detroit, is arranging for expansion at its plants at Cork, Ireland, and Trafford Park, vicinity of London, England. First noted works will be used in future for manufacture of Fordson tractors, including parts and assembling, and following removal of certain machinery from Cork plant to Trafford Park works, additional equipment will be provided. Trafford Park plant will be devoted in future to manufacture of automobiles only.

Imperial Airways, Ltd., London, England, is planning construction of airport in vicinity of Hamilton, Bermuda, including hangars, repair and reconditioning shops, oil storage and distributing buildings, and other mechanical structures.

New Trade Publications

Arc Welders.—Fusion Welding Corporation, 103rd Street and Torrence Avenue, Chicago. Folder of four pages devoted to Fuzon arc welders, and giving dimensions and general specifications for three sizes. General design and other data are included.

Racks for Storage.—Revolator Co., 336 Garfield Avenue, Jersey City. Four-page folder devoted to racks for storage of barrels, drums and kegs with their contents. Included are tiering machines for putting the materials into storage and removing them from storage.

Production Tools.—Kelly Reamer Co., Cleveland, Ohio. Catalog of 94 pages describes a line of production tools for all classes of boring and reaming, including various types of tools for multiple cutting, with numerous illustrations. Other parts of the catalog illustrate and describe the set-up of tools and fixtures on machines for specific operations.

Power Shovels.—Thew Shovel Co., Lorain, Ohio. Loose-leaf handbook covering very completely the operation, care, adjustment and application of the Lorain line of steam shovels. Numerous illustrations are included. One section is devoted to excavation information and tables. This book is intended to instruct the operator and assist him in becoming more proficient and also to aid erecting engineers in making standard adjustments.

Powdered Coal.—Combustion Engineering Corporation, 200 Madison Avenue, New York. Reprint in four pages of an article by Henry Kreisinger, which appeared in *Power*, May 29. This deals with the present situation in the use of powdered coal and in equipment for using it.

Celite for Concrete.—Celite Products Co., Los Angeles. Bulletin 339 of 16 pages illustrates and describes the use of Celite as an ingredient in concrete for building purposes. The illustrations are mostly from work in progress. Directions are given for the use of the material.

Arc Welder.—General Electric Co., Schenectady, N. Y. Bulletin GEA-874B of four pages illustrates and describes a portable welder with a.c. motor. Distinctive features are emphasized and specifications given.

Unit Pulverizer.—Erie City Iron Works, Erie, Pa. Bulletin of 4 pages illustrating and describing the Unitype pulverizer for powdered coal, which is built in four sizes with rated capacity from 250 to 7500 lb. an hour. Dimensions are given, together with a section of the pulverizer and installation views.

THE IRON AGE

New York, September 20, 1928

ESTABLISHED 1855

VOL. 122, No. 12

Alloy Bridge Steel Sixty Years Old

Excellent Condition of Chromium Steel in St. Louis Bridge—Historical Notes on Difficulties Encountered During Manufacture, Fabrication and Erection of First Steel Bridge in America

BY E. E. THUM*

FROM time to time prominent bridge engineers express their wariness of heat treated alloy steels for long-span bridges. This prejudice is being gradually uprooted, if one may judge by the growing use of silicon, manganese and nickel steel and of heat treated eyebars in the important structures now being constructed. Doubtless the situation duplicates many features of the transitional period when the tried and true wrought iron was being slowly replaced by the stronger carbon steels. The parallel is almost complete. Then, as now, the comparatively new metal, at a higher price, could be used with economy only for the longest spans where the saving in weight through the use of stronger metal counterbalanced the increased price per pound.

Pioneer Uses of Steel in Bridges

It is worthy of record that the first American bridge to use steel for main members was the arch bridge over the Mississippi River at St. Louis, designed by Captain James B. Eads. (Captain Eads, by the way, was a most versatile engineer, having achieved noteworthy success in glass manufacture and gun-boat building, and later in life supervised

control works for the lower Mississippi River.) The bridge then was, and still is, regarded as a most remarkable monument to engineering. The size of the arches (520-ft. span), the heavy loadings assumed (a double line of locomotives and a crowded highway deck), the unprecedented feat of sinking masonry piers to bed rock 110 ft. below water level, and the total cost of \$6,540,000 were the features which attracted most attention.

Captain Eads boldly decided that nothing but the best crucible steel would serve for the arch ribs. As will appear in the sequel, he had to advance even further and install chromium steel for these principal load-carrying members. Consequently the Eads bridge is not only the first American bridge to use steel, but it is also the first anywhere to use alloy steel. (a) That the decision was a wise one is shown by the record of uninterrupted service, and the minute examinations given it in 1902, 28 years after its completion, and again during the past winter. After the latter examination, the board of engineers certified that "the Eads bridge is in excellent physical condition, and amply safe

(a) The first bridge to use steel for main structural members was built between 1863 to 1868 at Kuilenburg, Holland, over an arm of the Rhine. Its main span is a 515-ft. truss, and it carries a double-track railroad.

*THE IRON AGE, New York.

for the loads and service it is called upon to carry and is carrying." This despite the fact that the highway has been strengthened, once to carry a track for street cars and later for heavy interurban trolley cars, and that both railroad tracks were reconstructed in 1926 to carry wheel loads of freight and passenger cars that have so largely increased since 1868, when the bridge was designed.

Evidence That Steel Strength is Permanent

Such structures as the Eads bridge are the best evidence which could be gathered about the permanence of the properties of well made steel. To quote Henry Miller, president of the Terminal Railroad Association of St. Louis, the present owner of the structure, "there are many who think that steel crystallizes with age, but I have seen so many old

Fig. 1—Cross Section of Main Arch Members. Crucible steel sheath incloses six staves of chromium steel

structures taken down in good condition that it is my impression that if the metal is of good quality, not overstressed, and properly protected it will last indefinitely, and this is exemplified by the experience with the Eads bridge."

Corrosion is the greatest enemy of metal. As a matter of fact, the reconstruction work on the highway deck in 1924 showed that steel I-beams installed in 1902 were unfit for further service where they were exposed to the smoke of locomotives passing on the lower deck. Wrought iron members of the same floor system, installed in 1874, were not seriously damaged in more than double the time.

Plain Chromium Steel in the Arches

Minute examination of all members in the bridge was made last winter by J. N. Ostrom, consulting engineer, and aside from a few minor details no evidence of overstrain, such as cracking of paint films, could be discovered. Mr. Ostrom drilled 1-in. inspection holes in the bottom of each of the main arch members (which are built-up tubes, as described later) and found the interior dry and the original bitumen coating in good condition. No traces of interior or exterior corrosion were noted. Analyses of these drillings revealed the steel to be a high-carbon chromium steel extremely low in sulphur. Since it is known that the steel was made in the crucible process, the uniform chromium

content is quite remarkable. The analyses fall within the range given in the accompanying table.

Analyses of Chromium Steel in Eads Bridge

	High	Low	Average
Carbon	0.95	0.64	0.79
Manganese	0.23	0.018	0.11
Silicon	0.19	0.056	0.10
Sulphur	0.013	0.006	0.009
Phosphorus	0.082	0.007	0.044
Chromium	0.68	0.54	0.61

It required 3 to 10 drills to go through the 2 1/4 in. of chromium steel in the tube wall, there being rough agreement between the number of drills used and the carbon analysis—a 70-carbon steel requiring three drills and a 90-carbon steel ten.

Loads Carried by Alloy Steel

As will be described later, the chromium steel in these main members was proof-tested very thoroughly in full sized pieces, and there is no doubt that its elastic limit in compression averages at least 60,000 lb. per sq. in. Small sized test bars machined from crop ends regularly developed ultimate strengths of 115,000 to 140,000 lb. per sq. in. in tension. Captain Eads used a design stress of 30,000 lb. per sq. in. in compression for the most unfavorable combination of loads.

Stress analyses made last winter by J. M. Johnson for the loads the bridge may now be called upon to carry show that the greatest working stress to be expected even now is 39,700 lb. per sq. in., a maximum that is 10,600 lb. less than the proof-load and an even greater amount below the elastic limit. This stress occurs in the unlikely event that a hurricane strikes the bridge when both railroad and highway decks are loaded to capacity and on the hottest day in the year. Captain Eads believed the bridge to be twice as strong as it need be for the conditions of 1870, (i.e., that his design stress of 30,000 lb. per sq. in. for the alloy steel arches was half what it might be for the chromium steel used). Consequently from his recent computations Mr. Johnson believes that the maximum probable stress today of 39,700 lb. per sq. in. should not be considered dangerous. The day-by-day working stresses are figured at 31,000 to 34,000 lb. per sq. in. He further remarks: "Consideration must also be given to the fact that high-strength steels are much more reliable under compression than under tension."

Under these conditions, namely, that there are no signs of corrosion or distress in the main bridge members, and that analysis of the loads now being carried give maximum stresses no greater, in proportion to the elastic limit and ultimate strength of the material, than are now being used as a basis for designs with ordinary structural steel, the engineer making the investigation had no hesitancy in stating that the Eads bridge is amply strong for its present duties.

Steel Making Art in 1868

Fortunately a voluminous account of the Eads bridge was written by Calvin M. Woodward, of Washington University, St. Louis. It is most interesting reading for the bridge engineer; it also contains many side lights on the steel and iron industry of the day. Thus, the state of the art in 1868 may be inferred from the following quotation

Fig. 2—Exterior of Assembled Arch Member; Coupling Grooves Cut on Ends

from Captain Eads's first statement to his associates in the Illinois & St. Louis Bridge Co.

"To obtain the highest value of cast steel in compression I think it should be used in the tubular form. Although cast-steel tubes have been recently drawn cold by hydrostatic pressure in France, I cannot learn that the process has been carried beyond the production of gun-barrels. (b) As the use

tested to a degree of strain much beyond what it can by any possibility be subjected to when in the bridge. For this purpose I am having a powerful machine made."

Stormy Sessions with Andrew Carnegie

This last provision was the source of much delay and anxiety. A contract for metal work and erection was signed

Fig. 3—Assembly at Main Panel Points

Feb. 26, 1870, with the Keystone Bridge Co., Pittsburgh, before working drawings were delivered. Prices were:

Crucible steel work...	15c. per lb. (planing staves extra)
Wrought iron work.....	7.9c. per lb.
Cast iron work.....	6c. per lb.
For testing materials.....	\$36,000
For erection	\$104,000
Time required	17 months (c)

Soon it was found that there were many unusual requirements implied in the contract. "Both iron and steel makers were unaccustomed to the rigid tests," says Professor Woodward's history. "The insertion into specifications of the items of elastic limit and modulus of elasticity was a new feature in bridge contracts. Moreover, the grade of workmanship desired was altogether exceptional." To illustrate the practical effect of such specifications, it may be mentioned that no pipe maker would tender bids for horizontal struts between chords (Fig. 3), because acceptance tests were to be made on one out of every 20.

The Keystone Bridge Co. (Andrew Carnegie, vice-president), subcontracted all the metal, getting only the wrought iron eyebars and structural shapes from an associated organization: Carnegie, Kloman & Co. (Union Mills). The eyebars were special—more metal was upset in the heads than usual. (d) It seemed impossible to meet the specifications without triple rolling, a costly procedure, so an argument was started about the form of the test piece. Eads held for a cylindrical "bolt," Kloman wanted a ½-in. circular groove turned in the center to localize strain. Eads refused because he held that this gave a fictitious increase of 10 to 15 per cent in breaking load, and the form was such that the elastic limit and modulus could not be deter-

(c) The bridge was finally opened July 14, 1874, three years late.

(d) Specifications were as follows: Eyebars to be of best American iron; upset ends to be planed on both sides, pin holes drilled. Each bar to be subjected to proof load of 20,000 lb. per sq. in. without experiencing permanent set. Specimen test bolts to develop 60,000 lb. per sq. in. ultimate strength. Test pieces cut from plates to develop 60,000 lb. per sq. in.; beams, 55,000; angles, 50,000.

of cast steel in bridge building is comparatively in its infancy, I have used the material at a much safer limit as regards its ultimate strength than my judgment would otherwise dictate. When this material comes to be universally used in bridge construction in the place of wrought and cast iron (as it inevitably will be because of its greater economy), the very large margin for safety in your bridge will be more fully appreciated.

"To insure a uniform quality and high grade of steel at the lowest prices, I propose to have the steel rolled for the arches in bars of 12 ft. length, and of such form that six of them shall fill the circumference of an 18-in. riveted steel tube, ¼ in. thick, in the manner that the staves of a barrel fill the hoops. [See Figs. 1 and 2.]

"This would virtually form a steel tube 18 in. diameter and of 13¼ in. bore, the steel being about 2¾ in. thick at most. The tubing in which the steel bars will be inclosed will effectually protect the latter from the weather.

"Every part of the structure is to be thoroughly

(b) Captain Eads uses "cast steel" not in the sense of steel casting, but to distinguish crucible cast-steel from blister steel. In the parlance of the day "cast steel" or "homogeneous steel" referred to what would now be called crucible steel forgings or bars.

mined. The iron shapes rolled at Union Mills also seemed to be about 10 per cent below specifications that were representative of best foreign and American bridge work. The matter was finally compromised by the makers accepting a 9 per cent reduction in price per pound, and all iron details were increased 10 per cent in cross section.

Meanwhile, the steel contractors were having many troubles. The Keystone Bridge Co. strenuously objected to any modification of the requirements for the steel, wishing to delay deliveries from sub-contractors and thus avoid penalties for slow erection. Matters came to such a head that one of Captain Eads's associates wrote: "I entertain a fear as to the willingness of the Keystone Bridge Co. to complete the bridge in time, if at all. Your letters evince a spirit of fault finding, captiousness, and a supercilious

then to be made of six selected staves having approximately the same modulus. Small test pieces were to be cut from 5 per cent of the staves, selected by inspector from extra long staves or those rejected for imperfect workmanship, and must develop a minimum elastic limit of 40,000 lb. per sq. in. and minimum ultimate strength of 90,000 lb. per sq. in. If, however, a failure of such a percentage of these tests should occur as to create a want of confidence in the remainder, the chief engineer may cause such additional numbers to be tested as to insure the requisite strength in each staff.

The Keystone Bridge Co. sublet the steel manufacture to William Butcher Steel Works of Philadelphia (Samuel Huston, president) at 10¾ c. per lb., tested. This company

Fig. 4—Design of Couplings for Arch Members

disregard of the spirit and letter of the contract." To which Carnegie replied: "Captain Eads had expected that the steel staves would be rolled as to require no planing. Now, every bar must be planed. All holes are to be drilled—a thing unheard of! Our upset links [eyebars] must be made in a different way. All links in all lands are hammered only; these have to be planed. Captain Eads must require only the custom of the trade. Of all men, your man of real decided genius is the most difficult to deal with practically." And it was by that time inexpedient to annul the contract, because of Carnegie's influence with various railroads which were presumptive users of the new bridge.

Endless disputes were finally adjusted by referees: Eads got the required metal and the Keystone Bridge Co. got \$363,000 in extras. Nevertheless Eads and Paul Dahlgren, his first testing engineer, had started something that continued, namely, close inspection and testing of steel work on important structures. By 1873 inspection of bridge steel was general in America. By 1877 every forged eyebar was given a proof test as a matter of routine.

Steel Bolts a Failure

Such difficulties with getting high-grade iron as sketched above foreshadowed even greater troubles with steel. Indeed, they arrived when the first anchor bolts were tested, and continued almost unabated until attempts to make the couplings of steel were abandoned. Many small sized test bars convinced Captain Eads that several manufacturers either in America or Europe could make steel of the quality called for in the specifications, namely:

Each steel bolt must be able to withstand without permanent set a load of 40,000 lb. per sq. in. Specimen bars cut from each end of each bolt must develop 100,000 lb. per sq. in. ultimate strength.

Steel for tubes must have modulus of elasticity between 26,000,000 and 30,000,000. Each bar to be tested and modulus stamped on it. Each tube was

was the pioneer American maker of steel castings (1867), but the equipment and staff were wholly inadequate to manufacture forged steel bolts 5¾ in. diameter, 34 ft. long, with upset ends. To make them rectangular ingots 15 in. square, 48 in. long were cast, carefully examined for surface cracks, and drawn down under a steam hammer with several reheatings. The first bolt to be tested broke at a unit stress of 30,000 lb. per sq. in., endangering the testing crew, 30 ft. away. The second broke at 33,000 and the third at 26,000 lb. Since the fractures showed no gross defects, and since test pieces taken from the bars developed the specified strength, it was thought that light forging at the finish had caused large internal tension stresses near the axis of the bolt. Annealing was suggested, but the first annealed one broke at 12,000 lb. at a flaw near the end, and the next one wrecked the testing machine.

Fig. 5—"Corrugated" Sand-Cast Ingots Unsuccessfully Used for Rolling Couplings

And so it went. Of 87 steel bolts made for test, 27 broke under proof load. Of 80 wrought iron bolts (made by Union Steam Forge, Bordentown, N. J., Bridgewater Forge of Massachusetts, and others) tested under proof load of 18,000 lb. per sq. in., not a single one failed. No good explanation of the trouble with the steel bolts was forthcoming, other than the probability that the steel makers were unable to control the mixtures in the crucibles so as to make such a large ingot of homogeneous metal. The broken anchor bolts were doubtless overheated and cold worked by the hammer men.

Meanwhile the Butcher plant was having trouble with the staves. As seen from Fig. 1 they are much lighter pieces

(Continued on page 733)

Survey Shows Upward Profit Trend

General Rising Tendency Indicated, Especially for Larger Corporations, Although Counter Movement Is Disclosed in Particular Industries

THE trend of profits in the United States in the past three or four years has been generally appraised on the basis of published opinions resting solely on facts pertaining to one industry or industrial group, or on inferences drawn from considering several such stated opinions. Manifestly there have been high and low spots in industrial results, so that broad conclusions based on limited data are unlikely to be dependable, and are still less likely to disclose general underlying factors affecting profits.

To obtain a more complete picture of the profit trend in industry, Harry A. Bullis, secretary and comptroller of the Washburn-Crosby group of flour mills, now combined under the name of General Mills, Inc., undertook a comprehensive investigation. He addressed inquiries to 7500 American

PROFIT Trends for a Number of Larger and Smaller Corporations Contrasted. The graph for the smaller companies is based on reports obtained by Harry A. Bullis, that for the larger on data provided by a corporation service agency

manufacturers. From the replies he selected about 300 that were complete in their answers to his questionnaire. To these he added 350 financial reports from corporation service agencies, and a study of corporation tax returns from the United States Internal Revenue Department. He also corresponded in detail with trade associations and industrial groups.

The results of the investigation were presented by Mr. Bullis in a paper read at the recent annual meeting of the National Association of Cost Accountants at New York. The paper will eventually be published in full by the association, but, in the meantime THE IRON AGE has prepared a diagrammatic presentation of figures obtained from the larger manufacturing industries.

A fact that became evident in the course of the inquiry is that industries, if arbitrarily classified into two groups of "small" and "large," show different profit trends. The dividing line between the small and the large companies was drawn at \$1,000,000 of net income annually. Income figures for 650 corporations were classified in this way according to size and then grouped by industries. Indices of profit and sales for each group for the five years 1923 to 1927 were computed on a scale of 100 for 1923. In many

SHARP Variations in Profit Trends Are Shown in Different Industries. The graphs, at left and right, though not intended to give a complete picture for industry as a whole or for any one industry, reflect no general economic condition warranting the description "profitless prosperity"

cases a similarity in the results of business operations in the small and large companies in a given industry is disclosed. A few distinct departures from the general trend of profits are shown for certain industries, but the causes for the difficulties that have beset these manufacturers are, in some cases, generally recognized.

Mr. Bullis's investigation showed that, although profits have been declining in some industries because of special circumstances, the general profit trend for larger manufacturers is upward. He believes that much of the discussion of declining profit margins refers not to the total amount of earnings but to the smaller margin of profit in each sales dollar. He states that it is also probable that there is a declining rate of return per unit of investment in many industries.

The upward trend of profits among the larger companies is particularly noteworthy because of the declining tendency of prices. Quoting from an article by David Friday in the *Atlantic Monthly* of February, 1928, Mr. Bullis said that the Bureau of Labor Statistics price index of non-agricultural products for the year 1920 was 241, on the basis of the five-year period 1910-1914 as 100, and by 1925 had declined to 165. Yet the total profits of all manufacturing and mining corporations (before taxes and depreciation were deducted) were \$5,537,000,000 in 1920, and in 1925 had increased to \$6,013,000,000. Manifestly the level of prices was not the controlling factor in determining the profits of the two years. Again in 1922 the price index began at 158 in January and rose to 175 in December; yet in spite of this price increase the total profit was only \$4,536,000,000. With an average price level higher than in 1925, profits were only about three-quarters as great.

The explanation lies in the greater volume of output and the increased efficiency of labor in 1925; the Federal Re-

serve Board's labor index of output rose from 87 in 1920 to 104 in 1925. During the same period, the index for the number employed went from 103 in 1920 to 90 in 1922 and 95 in 1925, while the total payroll changed from 124 to 89 and 107 in the respective years. With the gain in volume of output, overhead costs were reduced and profits increased accordingly. Continuing, in 1926 the price index was 161, and in 1927, 152; yet the labor index of output in 1926 rose to 108, and industrial profits showed a gain of 10 to 15 per cent. In 1927 profits were nearly the same as in 1925, although prices declined five points between the beginning and end of the latter year.

It is apparent that higher efficiency in production and a larger volume of consumption have both contributed to an increase in total profits in spite of a decreased percentage of profit with respect to selling price.

One reason that income returns of corporations are sometimes misinterpreted, it is pointed out in Mr. Bullis's paper, is that many corporations are conducted for certain technical advantages only, or merely for the benefit of other corporations, and are not expected to show a profit. Thus a considerable proportion of all corporations may appear to be unsuccessful, although many of them are, in fact, performing important service in connection with the successful operation of larger companies that earn satisfactory incomes.

Mr. Bullis summarized conclusions drawn from the statistics he assembled and the comments of his correspondents as follows:

"Although profits have declined for all companies in certain industries, and for some companies, especially the smaller units, in many industries, profits in industry as a whole have not declined, but have been on somewhat of an upward trend."

Combination Firing of Blast Furnace Gas and Pulverized Coal

SEVERAL Stirling boilers in the Ensley plant of the Tennessee Coal, Iron & Railroad Co. have been fitted for burning either blast furnace gas or powdered coal or both. The earliest of these units was first fired in 1922. Additional boilers have been added and their performances formed the subject matter of a paper by F. G. Cutler, chief of the bureau of steam engineering of the Tennessee com-

close whenever the pressure falls. By regulating the supply of gas to these boilers, the supply going to the hot blast stoves and to the boilers fired with that gas only is equalized, thereby reducing the demand for regulation of gas and air supply on those units.

Comparison of conditions prior to this installation with those subsequent is made in the table. This covers nine yearly periods, the first four of which represent conditions previous to installation of the boilers. The last four years show conditions after the boilers were in service and are based on the assumption that 70 per cent of the total heat in the top gas was delivered to the boilers. As the furnace gas is not washed, the calculated heat in the top gas includes the sensible heat.

Wood-Working Tools Made of High-Speed Steel

Hartford Chapter, American Society for Steel Treating, opened its 1928-29 series of meetings on Sept. 11, by entertaining Henry E. Allen, chief metallurgist Henry Disston & Sons, Inc., Philadelphia. Speaking on the general subject of "Tool Steels," he mentioned more particularly the effect of molybdenum. One alloy tool steel containing nickel and molybdenum and about 0.85 per cent carbon was said to harden through to the center of a 1¼-in. bar when water quenched. This illustrates a combination of alloys to produce a hardening effect which neither one, alone and in the same amount, would produce. Molybdenum added to chromium steels is said to produce a finer grain and tougher tools. Mr. Allen also mentioned the use of high-speed steel tools in wood-working machinery, and a high carbon silico-manganese steel for finishing chilled iron rolls.

Comparison of Ensley Plant for Nine Yearly Periods

Year	Average Boiler Hp. Generated By			Coke Per Ton of Pig Iron, Lb.	Heat in Mill, B.t.u. Per Hr.		Average of Rating, Per Cent
	Blast-Furnace Gas	Coal	Total		70 Per Cent Top Gas	Steam From Furnace Gas	
1919	29,798	1225	31,023	2867	1567	998	63.7
1920	29,174	1150	30,324	2917	1652	977	59.1
1921	24,890	1660	26,550	2784	1330	834	62.7
1922	28,126	2160	30,286	2732	1495	942	63.0
Average 1919-22	27,997	1549	29,546	2825	1510	938	62.1
1923	30,592	2300	33,892	2640	1655	1022	61.8

1926	31,965	5850	37,815	2473	1565	1070	68.4
1927	36,323	4030	40,353	2575	1827	1215	66.5
Average 1924-27	34,034	4800	38,834	2589	1697	1139	67.2

pany, read some time ago before the Fuels Division of the American Society of Mechanical Engineers. What follows is abstracted from that paper.

These boilers are arranged to be fired with either of the two fuels separately or a combination of both fuels at the same time. They have gas regulating equipment which operates to open the gas and inter-connected air dampers whenever the gas pressure on the mains increases and to

Lake Transportation of Automobiles a Growing Factor in Distribution

BY W. W. BURDEN*

IT is no longer uncommon to see the large lake freighters moving up and down the Detroit River, their decks covered with automobiles. In fact, the lake freighter has recently come into position as a standard means for the movement of factory shipments of automobiles.

Just when the first cargo of automobiles was shipped in this manner is not clear. According to one report it dates back to 1918, during one of the railroad embargoes of the war period. In any event the use of lake freighters for this purpose did not become much of a factor prior to 1925. The last three years, however, have seen this movement developed to its present magnitude.

Vessels carrying the majority of this business may be grouped in three classes: the bulk freighter, the package freighter and the "automobile carrier."

Chiefly, the business of the bulk freighter is the transporting of coal from Pennsylvania and Ohio westward, and the movement of grain and ore from the western and northern ports of the lakes back to the middle-western and eastern ports. This type of boat is designed especially for the service in which it is used. It has no "tween decks." The cargo hold is entered directly from the spar deck by means of a series of hatches running athwartship, spaced 12 ft. on centers and with 2 ft. between hatches. The depth of the cargo hold is about 26 ft.

The package freighter is equipped with side gangways for loading and has intermediate decks between the spar deck and the tank bottom. The automobile carrier may or may not have side gangways. Where access to the lower decks is not provided in this manner, a set of permanent

elevators serves to handle automobiles to and from the lower decks.

In addition to the freighter, the passenger vessel may be mentioned as carrying a limited volume of this traffic.

The automobile carrier has a maximum capacity of 650 automobiles, with an average of about 500. The bulk freighter will hold from 150 to 175 cars on its spar deck, and often carries many in the hold, while the package freighter usually carries from 30 to 70 cars, in addition to other commodities.

Automobiles for shipment are gathered at one of the various shipping terminals along the waterfront, the terminal having sufficient accommodations usually for 1000 to 1500 machines. The transportation company, by its own dispatching system, keeps track of the position of all available vessels. When a cargo is ready to move, the next vessel up is ordered into the pier for loading. As soon as the hawsers are made fast, the loading crew goes into action.

Each car is driven aboard under its own power. If the vessel has side gangways, these are utilized. If she has no such entrances, as in the case of some of the automobile carriers, machines are driven up on the spar deck by means of a convenient ramp and lowered to the decks below by the elevators. If the vessel being loaded is a bulk freighter carrying a cargo, the automobiles are driven on to the spar deck. Bridging is used to make a track for the automobiles over the openings between hatches, this bridging being placed prior to the movement of machines aboard.

Except in one instance, which will be the subject of a subsequent article, no attempt is made to anchor the cars

*100 West Kirby Street, Detroit.

to the deck or to provide any trackage except the flat bridging between the hatches. When the car is spotted on deck, it is put in gear and the brakes are set. The car then is covered with a tarpaulin. Experience seems to indicate that this is sufficient to prevent shifting of the cargo except in extremely heavy weather. The same scheme of placement and the same precautions against movement are taken with those cars lowered between decks, except that no canvas covering is used.

It requires about 3 hr. to load or unload an automobile carrier. It takes from 1½ to 2 hr. to load the deck of a bulk freighter. The loading and unloading time on a

made up of port-to-port shipments—the remainder having destinations inland.

The tariff on all lake shipments is regulated by the United States Shipping Board and the Interstate Commerce Commission. Passenger cars and trucks 12 ft. or less in length, going from Detroit to Buffalo, carry a transportation charge of \$8 each, to which 50c. is added for each additional 6 in. of length. From Detroit to Chicago, cars under 12 ft. 8 in. carry a charge of \$14.50, with a \$2 differential for each additional foot in length over 12 ft. 8 in. On the same basis, shipments from Detroit to Milwaukee carry a charge of \$14, with a differential of \$2 for each

LOADING of a Section of 'Tween Decks on Steamer Crescent City. The hoist "spots" the cars on one deck after the other. Here three decks are shown in use

package freighter depends largely on the amount and character of the freight other than automobiles.

The fastest boats in this service are capable of 13 knots, while the average will run a little less than 12, depending to a degree on the weather. Sailing time from Detroit to Chicago is 48 hr.; to Duluth, 66 hr.; to Cleveland, 36 hr.; and to New York, 6 days. The following are route distances to the principal ports:

Miles		Miles	
Detroit to Chicago	634	Buffalo to Oswego	163
Detroit to Milwaukee	569	Toledo to Buffalo	251
Detroit to Kenosha	597	Toledo to Cleveland	125
Detroit to Toledo	54		
Detroit to Cleveland	108		
Detroit to Buffalo	261		
Detroit to Erie	191		

Westbound cargoes of automobiles from Toledo or other nearby ports are usually brought into Detroit on the smaller vessels, making a short run. On arrival at the Detroit terminal the cargo is transferred to one of the larger vessels for the remainder of the trip.

Shipments bound for inland points beyond the lake ports are transhipped at the port either by rail or truck. It is possible of course to drive these cars on their own power from the port, if the final destination is not too far, usually about 300 miles being the limit. Trucking firms now operating in the lake ports handle factory shipped automobiles inland on special automobile trailers. One firm in Duluth has developed a special trailer for this purpose which holds three automobiles. Two such trailers are carried by one tractor unit. Another firm uses a trailer which will accommodate five automobiles.

In the traffic between Detroit and Cleveland—an overnight run—between 350 and 400 cars a day are being handled. The total annual movement of factory shipments by water is variously estimated between 130,000 and 150,000 cars, with approximately two-thirds of this volume

additional foot. The schedule of shipments from Cleveland or Toledo to Duluth, and from Detroit to Duluth, are as follows:

	Cleveland or Toledo to Duluth	Detroit to Duluth
Passenger Automobiles		
Under 111 in. wheel base.....	\$23.00	\$18.00
111 in. to but not including 128 in. wheel base	25.50	20.50
128 in. to but not including 144 in. wheel base	32.50	27.50
144 in. to but not including 160 in. wheel base	41.50	36.50
160 in. and over.....	50.50	45.50
Freight Automobiles		
Under 13 ft. over all.....	23.00	18.00
13 ft. 8 in. to but not including 14 ft. 8 in.	25.50	20.50
14 ft. 8 in. to but not including 15 ft. 8 in.	32.50	27.50
15 ft. 8 in. to 16 ft. 8 in.....	41.50	36.50
Over 16 ft. 8 in.....	50.50	45.50

This subject, from an economic viewpoint, has several phases. The shipper, or more precisely the automobile dealer, to whom the shipment is consigned, saves the blocking and tilting charge required in railroad shipment. As quoted by the Shipping Board schedule, these charges, which are in addition to the freight rates, follow:

Charges for Loading Automobiles, Freight or Passenger	
The charge for blocking, bracing and—or—tilting passenger or freight automobiles is as follows:	
For furnishing and installing blocking.....	\$4.75 per carload
Bracing and tilting materials to tilt one automobile in one freight car, in addition to blocking charge.....	5.00 per carload
Bracing and tilting materials to tilt two automobiles in one freight car, in addition to blocking charge.....	8.00 per carload
Bracing and tilting materials to tilt three automobiles in one freight car, in addition to blocking charge.....	13.00 per carload

This saving accrues to the dealer, inasmuch as sales prices for automobiles are fixed and include all items of railroad freight costs. The shipper also saves some time in being able to have his shipment moved directly off the

Handling Automobiles on Great Lakes Steamers

PREPARING to Hoist a Car from the Hold of a Bulk Freighter or Ore Boat (Right). Below, the steamer David P. Thompson is moving away from the dock of the Minnesota-Atlantic Transit Co., Detroit, with a deck load of automobiles. At the head of page 689 is seen the load on this steamer, consigned to the Northwest

UNLOADING a Deck Load of Automobiles at Duluth. In the foreground is the turntable for swinging each car through 90 deg., so that it may be run off the steamer to the wharf. This turntable is "spotted" opposite each row of cars in turn. Sheet steel troughs hold the cars in position during the voyage

boat, without the customary railroad yard terminal and unloading delay.

All shipments are entirely covered by marine insurance—the insurance going into effect before the cargo leaves the port of origin and extending throughout the time the cargo is being unloaded at the port of destination. Losses in this service have been negligible and have occurred only by reason of the heavy weather early in the spring or very

late in the fall. The navigation season opens approximately April 15 and closes shortly after Dec. 1.

Boat shipments of automobiles and trucks have been steadily increasing since 1925. The increase in 1926 was about 7.4 per cent, while 1927 showed a further gain of 12.3 per cent. From present indications the increase for the current year will be relatively larger, as the movement is rapidly gaining favor with both shipper and dealer.

Distribution of Rolling Costs in Various Countries

SURVEYING rolling mill practice, with special reference to reducing production costs through judicious rehabilitation of existing equipment, G. A. V. Russell read a paper last spring before the Institution of Mechanical Engineers at Swansea, Wales. In the course of his paper he presented a diagram of rolling costs, from which our illustration is taken. What follows is abstracted rather freely from the paper.

Broadly speaking, modern rolling mill machinery has reached its present state of development under the stimulus

while the production of a corresponding plant of the same general type in England is between 1500 and 3000 tons. The author believes that the present three 8-hr. shifts in vogue in Great Britain could give way to two working shifts and one idle shift, while turning out the same tonnage as at present. This would save about 33 per cent of the productive labor costs and would provide other incidental advantages in reducing the aggregate rolling costs. His suggestion is predicated upon the difficulty of the steel companies in marketing even the present comparatively small production.

Among the incidental advantages expected would be the ability to carry out the bulk of maintenance work on the mill in ordinary working hours, instead of at week-ends when overtime rates prevail. The plant would be available for maintenance purposes a greater proportion of the time, permitting this work to be performed more efficiently and thoroughly. Electrically driven mills can so arrange the working shifts that surplus power in stand-by hours could be disposed of to local public utilities, or purchased power could be utilized largely on off-peak rates. Steam-driven plants would find it possible to get the fires in good shape between turns. Heating practice both at soaking pits and in reheating furnaces could be improved, with resulting smaller power consumption and roll wear. Consumption of lubricants would be diminished, as the amount required is more a function of the time the machinery is running than of the intensity of the work being done.

PERCENTAGE
Distribution of Rolling Costs. The American mill was rolling wire rod from the ingot; the British, sheet bar; the Continental, semi-finished shapes and railroad material

of economic necessity for conservation of four items: Time, owing to pressure of demand; labor, owing to increasing value of human effort; power; supplies and stores. Working on old established plants, expenditures to conserve labor and power will usually yield the largest returns. The predominant influence of labor costs, and particularly of labor plus power, will be noted from the illustration.

One outstanding difference between British and American rolling mill practice lies in the much more onerous demands made upon production equipment in the United States. The author cites an average blooming mill, which in the United States would be expected to roll monthly about 60,000 tons of ingots into 6 by 6-in. blooms. He gives an example from the Ensley works of the Tennessee company, in which the average tonnage on a 12-hr. shift (in 1923) was 1730, making 144 tons an hour. The blooming mill rolls made 684 passes an hour in the six turns surveyed. This was in rolling 24 x 24-in. ingots weighing 10,800 lb., with a few larger ingots up to 14,000 lb. Few plants in Great Britain, with anything like such an output, would rely on one blooming mill. The author refers to several rolling about 30,000 tons a month and doing it on two mills.

Medium-sized merchant mills in the United States are stated to be turning out from 6000 to 7000 tons a month,

Grinding Surface of Spring Leaves Increases Endurance Markedly

An extended research on spring steels has been under way at the National Physical Laboratory at Teddington, England. The following steels are under investigation, they being the analyses most frequently used for making leaf springs in England:

Type	Analysis	Quench (Deg. C.)
Carbon	0.6 C	950 in oil
Carbon	0.8 C	900 in oil
Silico-manganese		950 in oil
		or 870 in water
Chrome-vanadium		800 to 850 in oil
Low chromium	0.6 C, 0.6 Cr	800 to 850 in oil
High chromium	0.6 C, 1.4 Cr	800 to 850 in oil

Torsional fatigue limits of the silico-manganese and the chrome-vanadium steels were no higher when tempered at a low temperature (and with correspondingly high tensile properties) than when drawn at higher heats, unless the surface was highly polished—a condition wholly impracticable in service.

An interesting finding is that 0.6 carbon steel spring leaves have a fatigue range of 30,000 lb. per sq. in. in the ordinary forged and heat treated condition, but this figure is increased to 85,000 lb. per sq. in. by grinding 1/16 in. off the surface, thus removing all microscopic hardening cracks. J. Bradley has devised a high-speed testing machine for testing such spring leaves.

Why Tilting Furnaces Are Better

They Aid in Working an Open-Hearth Heat and Avoid Many Troubles—Likely to Make Better Steel

BY CARL W. PEIRCE*

IT will be the purpose of this article to present the different points of superiority of the tilting furnace which aid in giving a more uniform grade of product, greater tonnage and a more economical operation. The thought which suggested it was brought out in Doctor Waterhouse's paper "Basic Open-Hearth Practice," read at the May meeting of the American Iron and Steel Institute in New York.

Ability to Remove an Unsatisfactory Slag

In stationary practice heats often melt with raw slags which are hard to get into shape, and faulty steel can be traced in many cases to this type of melt. With the tilting type, it is possible to cant the furnace forward and remove a large part of the undesirable slag and then make a new one by the addition of burnt lime. This can be done without the slag becoming too heavy and viscous and destroying the action of the boil which is necessary in making good steel.

Tilting Furnace Does Away with Slow and Hard Taps

One of the difficulties encountered in stationary furnace practice is that of slow and hard taps. In making quality steel in a stationary furnace, where a close tapping temperature is desired, a slow tap will often cause a skull in the bottom of the ladle and produce bad pouring of a large part of the heat. This will more than offset the good results expected from the close tapping temperature. Because of this fact, melters prefer to take no chances and so tap their heats hotter, to insure a clean pouring practice.

Hard taps, consuming from 10 to 30 min. in getting the hole open, and the metal started in the ladle, are of frequent occurrence. All open-hearth men have seen heats break out through the front while the furnacemen were trying to get the hole open on a hard tap. In addition to the loss of production caused by such delay, the heat is getting lower in carbon and often the metal becomes too hot, producing an unsatisfactory heat.

In the tilting furnace the taphole, being on a level with the slag line, is usually opened a half-hour before the heat is ready to tap. It is cut out to permit a full-sized stream to enter the ladle when the furnace is sufficiently canted. This type permits heats to be tapped on a closer temperature, and in the long run less off-heats will occur, because the heats can be tapped when ready. With a full-sized stream quickly filling the ladle, a more uniform and better pouring practice will result.

Tilting Furnace Does Away with Soft and High and Raw Melting Heats

One of the most frequent causes of poor steel is that the heat from which it was made melted low in carbon, or soft. The size of the heat charged in a stationary furnace is usually governed by the size of the ladle into which it is to be tapped. The ladle is expected to be large enough to hold the charge, with the furnace and ladle additions and enough slag to keep the metal hot enough for proper pouring.

It often happens in stationary furnace practice that, be-

cause of a poorly working furnace, or a charge with iron too low in silicon, the heat will melt too low in carbon, requiring the addition of extra pig iron to finish the melting and working of the heat. Often, because of the fear that the heat will exceed the capacity of the ladle, not enough extra iron is added when the heat gets in this condition. Frequently, too, the furnace is driven at a high temperature and the metal is over-oxidized, in an effort to get the heat ready without the addition of extra metal.

Many times extra iron is added beyond the capacity of the ladle and, when the heat is tapped, the full ladle is taken to the pouring platform and the overflow allowed to run into the pit. In tilting furnace practice, the furnace is returned to an upright position when the ladle is filled, and any steel remaining in the furnace is left for the following heat.

Heats which melt excessively high and raw, due to high silicon in the pig iron or scrap, are of common occurrence in stationary furnace practice. This type of heat will require a large amount of iron ore to oxidize the surplus silicon and carbon and will require extra time and care in working the heat. This type of heat will produce better steel than the soft melting kind, but it is not so satisfactory as the one having a good, medium melt.

Both soft and high and raw melting heats can be avoided with the tilting furnace, as it is the common practice to add barely enough pig iron to melt the scrap and then, by frequent tests, judging the carbon and adding extra pig iron when the carbon gets down to 0.20 or 0.25 per cent. In this way uniform melts are obtained and at no time is it necessary to drive the furnace to avoid a soft melting heat. Faster time per heat can be made on the tilting furnace, also, because as a rule both soft and high and raw melting heats require a longer time for preparation than those with good melts.

Less Danger of Breakouts in Fronts and Ends

In making low-carbon steel in stationary furnaces, breakouts through the front or port ends frequently occur. Ofttimes a boil will start in front of one of the doors, and many heats have been tapped a few minutes ahead of time because of the fear of a breakout. Pig iron breakouts when the hot metal part of the charge is added to a stationary furnace are of common occurrence in all plants. With the tilting furnace, it is possible to cant the furnace backward, repair the weak spot and, after allowing it to set for a few minutes, return the furnace to its normal position without the danger of the heat breaking through.

Less Bottom Trouble and Greater Tonnage

Perhaps the greatest criticism of the stationary type of furnace is the amount of time lost because of bad bottoms and banks. This is especially true in the manufacture of low-carbon steel. Often many hours are spent in washing out the furnace bottom to free it of accumulated lime and steel which have been left from previous heats. This washing out process increases the size of the taphole, so that when the repairs to the bottom are finished

*1011 West Fourth Street, Mansfield, Ohio.

it becomes necessary to burn in a new taphole. Usually some time is consumed in freeing the hole from pieces of steel and slag and getting it to the right level for the pipe.

In a recent conference of open-hearth men this subject was under discussion and the following reports given of the number of heats cast before it was necessary to put in a new tap hole: 5 to 30; 16 or 17; 6 to 25; every week; 10 to 20; 30; 35; 15 or 20; "with extremely low-carbon heats, we get only 2 or 3 heats." The use of compressed air for blowing out holes and lime ridges in stationary bottoms is very hard on the tapholes and increases their size.

In tilting furnace practice, the tapholes are on a level with the slag line and slope toward the bath; no heats are delayed on account of them unless it is necessary to drain the furnace. In the duplex practice, it is customary to drain the furnace at the end of each week's campaign, which usually consists of from 60 to 70 heats. For tapping the last heat and draining the bottom dry, it is necessary to cut the hole down. This is done quickly with the aid of an oxygen tank and hose.

When working on scrap and hot metal, tilting furnaces

are frequently operated for three or four months without being drained. The writer recalls one furnace which on its first run was operated for more than a year without being entirely empty. When shut down at intervals for general repairs, two heats were tapped and the remaining steel was left in the furnace.

Tapholes are put in on this type of furnace while it is being charged, by inserting a wood plug in the taphole and packing ganister mud around it. It is then faced on the furnace side with magnesite or burned dolomite. The greater part of the plug burns away, leaving a well-shaped hole by the time the next heat is ready.

Because of its ability to keep bottom troubles reduced to a minimum, and to avoid both soft and raw melting heats, greater tonnages and correspondingly lower conversion costs are possible with the tilting furnace. Furnaces working on scrap and hot metal practice are making from 9000 to 13,000 monthly, while one furnace working on duplex made 331,000 tons of steel last year. One plant, having both stationary and tilting furnaces, showed the tilting furnace to have a lower conversion cost by about 80c. a ton.

How Tractors Render Valuable Aid Around Industrial Plants

NEW uses are constantly being found for tractors around industrial plants, some of which are shown here. Possession of a tractor simplifies plant haulage. If wheeled trailers are not available, steel plates may be put on a low skid carrier and the tractor will easily drag along the dead weight.

Many plants find constant demands to move freight cars, to speed loading or unloading operations. The tractor comes in handy for jobs like this, as shown. Tractors sometimes render valuable service by hoisting steel plates for the construction of a tower or derrick, as shown in a third photograph.

Business Analysis and Forecast

Steel Industry Is in Sound Position

High Production Rate Demanded by Consuming Industries—Building Falling Off and Steel May Follow

BY DR. LEWIS H. HANEY

DIRECTOR, NEW YORK UNIVERSITY BUREAU OF BUSINESS RESEARCH

THERE appears to be a little danger that just a touch of the speculation now rampant in the stock market may be transmitted to the steel industry—perhaps through the medium of the automobile industry. It is true that severe competition exists in the manufacture and sale of automobiles, and also that the steel price structure is in general so low that it can hardly be said that the slightest trace of inflation is to be found there. We note, however, that just as people now seem to think that their favorite stocks are going to move upward forever, so the automobile manufacturers appear to think that people are going to continue buying new models at the rate that has obtained in recent months. And the steel manufacturers are possibly beginning to get the idea that above-normal production of steel can be maintained indefinitely without affecting the possibility of advancing prices for the various items of finished steel. There has recently been some talk concerning speculative buying of steel scrap and pig iron, and even some kinds of steel have been reported as being bought for stock.

Although our analysis shows that no appreciable progress of the speculative craze is apparent in the steel industry (and it seems doubtful if such a development can make much progress), perhaps a suggestion of caution is not amiss. It should be remembered that steel production is 13 per cent above normal and that building activity, at least, is on the decline. Bank credit is decidedly strained and high money rates are exercising a general effect in curtailing the flow of funds into industry through the sale of new securities. There is no indication of any general expansion in industry, such gains as have occurred during the last month or two having for the most part been merely seasonal.

Consumer Activity Demands High Output

AT present, the situation in the steel industry seems sound enough. Though steel production continues at a high rate, it can still be said with a good deal of certainty that it is no greater than the potential requirements of the consuming industries, as indicated by their activity in production. Whether these requirements are closely reflected in orders or not, the fact remains that the chief steel-consuming industries have since February been running at an average rate that amply justifies the general level of steel production that has prevailed during the summer.

Our composite demand line declined very slightly in

July, following a similar movement in June. The chief factor in holding down the demand figure has been the setback in building activity, the adjusted index of that outlet being now the lowest since last March. Freight traffic, general manufacturing, machine tool orders and iron and steel exports, also, either declined or made less than the usual seasonal gain in July. Automobile production, however, gained quite sharply, considering the season. Mining activity, including petroleum production, averaged about as before.

While steel production in July was a little too high in comparison with the composite demand line, it gained less than usual in August, thus showing a tendency to decline, and was below the probable level of the demand curve in that month.

Probably the level of demand in August was higher than in July, in spite of the slump in building. The period of tight money promises to continue for some months, and this is bound to affect unfavorably the demand for steel. August may well have been the peak month of the year in demand. But it seems equally probable that consumption will fall little below the present level during the remainder of 1928.

Conditions in Particular Lines

Railroad freight traffic shows little change, and certainly no expansion is indicated here. Total car-loadings in August amounted to about 4,812,000, which compares with 4,808,000 a year ago. As the size of the carload, however, is appreciably smaller, the total traffic in tons may be estimated to have been below a year ago, in spite of the fact that it was then on the downgrade. Railroad gross revenues in July were less than 1 per cent above July, 1927. Some improvement in net income is reported, chiefly due to economy in maintenance. Ultimately, of course, the carriers must make up for such economy, but no early increase in steel buying is indicated. The most encouraging symptom is the increase in locomotive orders last month.

As for the other steel-consuming industries, *building* continues the least favorable, with a considerable decline registered in August. This will before long bring a reduction in sales of structural steel and tend to reduce sales of some kinds of pipe and nails. The *automobile industry*, however, appears to have more than made up for any let-down in building, being unusually active for the season. July production decreased less than usual and probably the same will be found true of the August figure. Of course the industry cannot expand forever, any more than the

stock market can, but the end is not yet in sight and the new models contain such great changes that they will doubtless tend to stimulate buying.

General manufacturing activity, even excluding the automobile and steel industries, is at a high rate. It declined a little in July, but was at about the same annual rate as in May. Machine tool orders, which are often barometric, also declined a little more than usual in July and appear to have passed their peak. Some seasonal gain is probable, but no new high levels are to be expected, and possibly the gain will not be up to the fall seasonal proportions.

Mining activity continues at a low level, with little change in July and August. Copper production has increased considerably, but coal output is in small volume. Oil production shows little change, but the slightly declining trend of the first six months of the year has apparently been checked, while drilling activity shows a slightly rising trend.

In most important cases crops promise to be large, but the prices for the chief cash crops, wheat and cotton, are low. The farm situation is moderately favorable, and the business of the agricultural implement manufacturers promises to continue active.

Though large and much above a year ago, *exports* of iron and steel decreased more than usual in July.

Increase in Steel Output Below Normal

AS noted above, steel production, after reaching the peak of the year in July, fell off in August. The average daily ingot output actually increased, but the increase over July was much less than would be normal for the period. Our adjusted index for August is 113.2, or 13 per cent above normal. It compares with 119.2 in July, but a year ago the index was only 95.9. Except for April and July, the August index represents the highest annual rate made this year.

Unfilled orders, as reported, also increased over July, but here again the increase loses significance when consideration is given to the small changes that occur from month to month. In fact, *the gain of 53,000 tons was almost exactly normal, so that the adjusted index remains practically unchanged.* It may be concluded that the unfilled orders were maintained, but, even considering the season, were lower than they were in any of the first four months of the year and also lower than in June. In view of the efforts made to drive in new business during August, this is not a particularly favorable showing.

Steel prices have advanced. THE IRON AGE composite index of finished steel prices for August averaged 2.348c., against 2.321c. in July, and 2.367c. a year ago. The August average is exactly the same as that for May. Probably the average price of finished steel for the third quarter this year will be similar to the average for the second quarter. This, it is to be remembered, is 7 per cent under the average for the years 1923-1927, inclusive.

Pig iron production increased more than usual in August and, according to our estimates, was 9.6 per cent above normal. In July it was 6.5 per cent above normal and a year ago 3.6 per cent. Thus iron production is still low in comparison with the steel output, and it has been so since May last year. The pig iron output has just about reached a level at which, in the past, it has proved to be

too large to be long maintained and at which any advance in pig iron prices has been checked.

In August, however, the average price of pig iron advanced, as we had anticipated. THE IRON AGE composite figure for the month is \$17.11, against \$17.07 in July and \$18.13 a year ago. This is 20 per cent under the average for 1923-1927.

Structural Steel Bookings Expected to Decline

OUR index of the sales of finished steel declined fractionally in July. This was due to a considerable reduction in sales of structural steel and of steel castings, which more than offset the good gains in sales of sheets and plates. The total for the first seven months of 1928, however, exceeded that for the same period in any recent year by a good margin.

The decline in building activity is significant, as being one of the first indications of the unfavorable effects of tighter money markets. Building contracts showed only 78,873,000 sq. ft. of floor space in August, which compares with 82,125,000 sq. ft. in the preceding month. This decrease is notable as being in contrast with the usual gain that occurs in August. Our adjusted index becomes 123 per cent of the average for 1921-1926 against 132 per cent in July and 114 per cent a year ago (when building was recovering from the 1926-1927 slump). Both building permits and the value of contemplated new construction also showed a declining trend last month.

July data indicate that the bookings of fabricated structural steel were reflecting the trend in building. They dropped from 303,800 tons in June to 297,500 tons, the decline being greater than usual for the season. Such bookings, however, were still at a rate of 48 per cent above the average for 1921-1926. According to trade reports, some recovery seems to have occurred in August, but it is only a matter of a little time before structural steel bookings must follow the trend of building.

Price Structure May Adjust Itself

PIG iron may be said to be cheap in comparison with the general level of the steel price structure, and this fact is emphasized by the advance in coke prices during the past two months. The output, however, is large and has gained considerably on steel production. It is reported that most large buyers are well covered for the fourth quarter. While strength promises to continue, it does not seem likely that any long sustained or large advance in pig iron prices is in prospect.

Contrary to the case of pig iron, steel scrap seems relatively dear and has apparently been affected by speculative developments. The trend, however, is still upward and is likely to carry a little further in that direction. We think that the greater part of the advance has been made and that a reaction is probable before the end of the year.

Other price changes illustrated in the fourth chart are found in the case of bars, sheets and coke, all being in an upward direction. Sheet prices still appear to be too low and likely to advance further. Greater strength in pig iron markets will doubtless strengthen the movement to get higher prices for billets and bars, for these items are now about right in comparison with pig iron and the spread between them is normal.

Schedule of the next instalments of the Business Analysis and Forecast, by Dr. Lewis H. Haney, Director New York University Bureau of Business Research, follows: Oct. 4—Activity in Steel Consuming Industries; Oct. 18—Position of Iron and Steel Producers.

Horizontal Machines for Production Drilling of Transmission Cases and Other Parts

TWO new multiple-spindle fixed center horizontal drilling machines designed for the production drilling of automobile transmission cases have been brought out by the Defiance Machine Works, Defiance, Ohio.

One machine is a two-way opposed-

includes loading and unloading as well as drilling time.

The base of each machine is of box type, is heavy, well-ribbed throughout and has a cored center. The ways on which the heads slide are broad and deep. The multiple-spindle heads are fitted with alloy steel spindles which

jig plate is mounted in front of each head on the fixture. This is fitted with removable jig eyes for guiding the various sizes of drills.

The two-way opposed machine occupies a floor space 64 x 180 in. and its net weight is 19,580 lb. The two-way right angle machine occupies a floor space of 132 x 138 in. and its net weight is 18,700 lb.

Although Arranged for Production Drilling of Automobile Transmission Cases, the Machines Are Adapted for Use on Motor Blocks and Similar Work. Either Oilgear or mechanical screw feed may be provided

The Two-Way Opposed-Head Drilling Machine, Above, Is for Drilling the Two Sides of the Transmission Cases, While the Right-Angle Machine, Below, Is for the End and Bottom or Side of the Cases. Companion machines for tapping are also built

head unit and the other a two-way right-angle machine, the former for use in drilling the two sides of the transmission cases and the latter for drilling the ends and bottom or side of the cases. The machines can also be used for motor blocks or other similar work requiring multiple drilling machines. Companion equipment for tapping operations can also be furnished.

Oilgear feed is provided on both machines, although mechanical screw feed with rapid traverse movement can be supplied if preferred. The hydraulic cylinders are mounted in the base under the heads, which are equalized with cut steel rack and pinion. The stroke of each head of the opposed-head machine is 18 in. and of the right angle machine 16 in., with rapid traverse forward then change to the rate of feed desired for drilling, with automatic kick-off and automatic quick return movement. The Oilgear pump is driven by a 3-hp. 860-r.p.m. motor. Production is at the rate of one drilled case every 2 min., which

run in tapered roller bearings. The drive to the spindles is through stub-tooth heat-treated gears, which are entirely inclosed and are continuously lubricated by a force feed system. Spindle bearings of navy bronze can be supplied if desired.

The right-hand head of the two-way opposed machine has 36 spindles and the left-hand head has 31 spindles. Each head is driven by a 15-hp. motor. The right-hand head of the right-angle two-way machine shown in the illustration has 12 spindles driven by 7½-hp. motor and the left-hand head has 39 spindles that are driven by a 10-hp. motor. Speeds of the motors on both machines are 1150 r.p.m. The motors are direct connected to the heads by flexible couplings.

Each machine is equipped with a heavy fixture, which has a hardened plate and locating pins for centering, and a roller conveyor table which is raised and lowered by means of eccentrics, forming a stripper to raise the case off the pins and a roller conveyor after the case is raised. A heavy

Surfacers and Other Rotary Tools with Self-Fastening Blades

ROTARY surfacers with self-fastening, interchangeable high-speed steel blades, which may be fed out as they become worn, are being marketed by Tindel & Phillips, 516 Commerce Street, Philadelphia. These tools, illustrated herewith, are designed to rough and finish simultaneously, and the rake and clearance angles of the blades are said to be such that rapid and powerful cutting is assured. Wedges, screws or other fastenings are not used to hold the blades in the solid steel-plate disk which carries them. Twelve sizes of the surfacers, ranging from 6 to 24 in. in diameter, are regularly available. The 6-in. cutter has 11 blades and is rated to take a 17/32-in. face cut and a 1 31/32-in. side cut and the 24-in. tool

The Blades of the Rotary Surfacing Tool Are Interchangeable and May Be Fed Out as They Become Worn

has 28 blades and will take a 7/8-in. face cut and a 3 5/16-in. side cut. Tools up to 38 in. in diameter can be furnished special.

Rotary cold saws having two sets of blades, one on each side of the solid steel disk that carries them, to divide the cut, are also marketed by the company. The blades of these tools are interchangeable and self fastening. Slotting and channeling tools are also available and these, as well as the cold saws, can be furnished in 17 sizes from 12 to 62 in. in diameter. The 12-in. tools have 36

blades, are 0.250 in. thick and have a kerf of 0.312 in. and the 62-in. cutters have 86 blades, are 0.750 in. thick and have a kerf of 0.906. Slotters and

channelers of special diameters and thickness can be furnished to order, as well as saws up to 72-in. in diameter.

Vise-Plate with Two Service Feature

PATENT application has been made on the universal vise-plate illustrated, which is being manufactured

moving them from the vise. The clearance under the vise jaws, when the latter are vertical, is $1\frac{1}{2}$ in. Both

The Vise and Slotted Table Are Interchangeable on the Same Base. A piece held in the vise may be ground on one end, the vise rotated to a stop and the piece ground on the other end

by N. W. Ordway, 69 Congress Street, Hartford, Conn., for use in connection with milling or grinding machines as a vise or as a table, the vise and the table being interchangeable on the same base.

Many pieces difficult to machine may be attached to the table and milled or ground to any angle. The table and vise are graduated in degrees, 180 deg. each side of center, to facilitate setting and, with the application of verniers, angles may be measured within 5 min. of arc. After the pieces held in the vise have been ground on one end the vise may be rotated to a stop, and the pieces ground on the other end, without re-

the table and the vise revolve on a stud in the center of the upper base casting and are held down by the same hexagonal nuts. Removable keys extending parallel with the center of the fixture are provided in the base.

Two sizes of the vise-plate are available. The smaller has a table $3\frac{1}{4}$ in. in diameter and a base measuring $4\frac{1}{2} \times 7\frac{1}{2}$ in. The height is $4\frac{1}{2}$ in. and the T-slots are $\frac{1}{4}$ in. in width. The larger vise-plate, of identical construction, has a $4\frac{1}{2}$ in. diameter table, a $6\frac{1}{2} \times 9$ -in. base and $5\frac{1}{16}$ in. T-slots. The height is $5\frac{13}{16}$ in. The jaws of the vise, which open $1\frac{3}{8}$ in., are $\frac{5}{8}$ in. thick and 3 in. wide.

Wooden Wedges Produced Automatically

WEDGES of hard or soft wood and of various sizes are produced automatically on the machine illustrated, which has been placed on the market by the Oliver Machinery Co., Grand Rapids, Mich. The capacity is for wedges up to 3 in. in length, $1\frac{1}{8}$ in. in width and of various tapers with thicknesses from zero at one end to $\frac{1}{2}$ in. at the other end. The machine is entirely automatic and the output is from 50 to 60 wedges per minute.

Stock or raw material fed into the magazine consists of cross cut strips, the thickness of which will form the

width of the wedges, and the length along the grain will be the length of the wedge desired. The strips may be of any width up to 10 in. and although it is preferred to have the strips of uniform 10-in. widths, material of various widths can be fed into the magazine simultaneously.

Two motors are employed, one the feed motor and the other the saw motor, both of which are of $\frac{1}{2}$ hp. These motors are mounted on the machine and wired to suitable starters having a push-button start and stop station. The feed mechanism is adjustable.

The stock is fed forward by means of a pusher with suitable movement to provide the exact thickness of wedge desired. The proportions of the feed motor pulley to the worm gear case pulley controls both the vertical movement of the saw motor and the feeding forward of the stock, which motions are synchronized. The cutting unit consists of a high-speed saw, 7-in. in diameter, which is mounted directly on the motor. This unit has side motion for cutting at various angles and sufficient vertical movement, on the regular machine to produce wedges $1\frac{1}{8}$ in. wide. This vertical motion can be changed to suit requirements for wider wedges if desired.

Waste from each strip of wood inserted into the machine consists of the initial cut and the stub end. The automatic method of holding the piece while the saw cuts off the wedge permits holding a very small stub end, which is emphasized as much thinner than can be held by hand on a hand-operated wedge sawing machine. It is claimed that this waste is decreased

Production Is at the Rate of 50 to 60 Wedges a Minute. Accurate and smooth wedges, as well as minimum waste, are claimed

by 50 per cent. Production of wedges that are accurate and smooth is also claimed.

Following the lead set by many firms who have issued "house organs," the United States Cast Iron Pipe & Foundry Co., Burlington, N. J., has started a publication called *U. S. Cast Iron Piper*. Volume I, No. 1, dated September, contains four well-written stories about the properties and applications of cast iron pipe.

Introduces New Line of Riveting Hammers

THE Ingersoll-Rand Co., 11 Broadway, New York, has brought out a new line of riveting hammers in four sizes, having strokes of 5, 6, 8 and 9 in. respectively. High power, ease of operation and low air consumption are claimed for the new tools.

A feature stressed is the manner in which the handle is fastened to the barrel and kept tightly in place by a

The Handle Is Threaded to the Barrel and Prevented from Unscrewing by a Spring Locking Device

spring locking device. The handle is threaded to the barrel and the spring lock not only prevents the handle from unscrewing, but applies tension to automatically tighten it.

The valve operates in a hardened and ground valve box located at the head of the barrel and clamped in place by the handle. It has large bearing surfaces and is free from holes or ports from which cracks might start. The valve box has a solid upper end to provide a positive compression chamber for the piston on its up stroke. It acts to prevent the piston from striking the handle end, as this air cushion is not dependent upon an air-tight joint between the handle and the barrel. The barrel of the hammer is of steel, heat-treated and ground.

An open-type outside trigger handle is furnished as standard, but closed or inverted handles can also be supplied.

Portable Disk Sander

THE United States Electrical Tool Co., Cincinnati, has added to its line a 9-in. disk sanding tool, which is

A 9-In. Sanding Disk Which Operates at 3600 R.P.M., Under Load, Is Employed

equipped with ball bearings throughout and operates at a speed of 3600 r.p.m. under load. The machine is equipped with a fan-cooled universal motor and has a two-pole trigger

switch in the handle. Balance, facilitating operation, is a feature emphasized.

Regular equipment includes fine, medium and coarse sanding disks, flexible cable, two-piece attachment plug and armored cable guard. The weight of the machine is 12 lb.

New Magnetic Contactors

A NEW line of alternating current magnetic contactors for controlling lighting and power circuits automatically, and for miscellaneous applications, has been announced by the Cutler-Hammer Mfg. Co., Milwaukee. Hammer-head type magnets with self-aligning armature, continuous-duty magnet coil, hardened steel bushings, tin dipped solid copper contacts, magnetic blowouts and chimney type arc shields are features. The contactors, of large size, have the magnet frame supported on a spring plate to absorb the shock of the magnet on closing.

Two or three wire control can be

Magnetic Contactor for Automatic Control of Light and Power Circuits

used. With two wire control, low voltage release is provided and with three wire control, low voltage protection is provided. A wide variety of types and sizes are available, with the contactors mounted in a split inclosing case or on a slate panel for switchboard mounting.

Repulsion-Induction Motor

AN improved single-phase repulsion-induction motor in four sizes has been brought out by the General Electric Co. It is of constant speed, 1800 r.p.m., with a high starting torque, and is intended for general application. The sizes are $\frac{3}{4}$, 1, $1\frac{1}{2}$ and 2 hp.

More efficient use of the stator punchings is an important improvement in this four-pole motor. The motor has been designed with small overall length and a modification of the commutator and brush rigging design has permitted making the end shield the same dimensions at both ends, thus giving a symmetrical appearance. Phosphor bronze bearings packed with waste are applied at both ends.

Except for ventilating openings in the lower portion of each end shield the motor is inclosed. Air is drawn in by the internal fan on the pulley

end and passed out at the commutator end. The unit is designed to operate at a temperature not exceeding 40 deg. C. above that of the room.

Controls Temperature in Chromium Plating

A new equipment for controlling the temperature of chromium plating tanks is offered by the St. Louis Motor Valve Co., St. Louis, Mo. A special totally inclosed reversible motor of General Electric manufacture drives a threaded shaft through a double worm reduction gear mechanism. A lever, connected to this shaft and pivoted in its center, is arranged to operate two valves alternately, one for steam and one for water. A limit switch, at the top of the cast aluminum housing, stops the motor at proper positions.

The complete control consists of a contact-making thermometer, either of the recording or indicating type; a relay panel, and the duplex valve unit. The thermometer, which may be of any standard make, contains two contact points by means of which one circuit is made when the temperature is low, another when the temperature is high and none when the temperature is correct. The relay panel, which consists of two small contactors with series resistances, is operated by the instrument contacts. By the use of this relay the instrument contacts carry only a very small current and do not break an inductive circuit. Another purpose of the relay panel is to provide an electric circuit to the motor at the neutral position of the instrument.

Life tests in the laboratory and extensive tests in the field, it is stated, have proved this device to be both accurate and dependable in providing automatic temperature control where alternate heating and cooling is required. Many of the temperature charts, it is added, show a temperature variation of less than $\frac{1}{2}$ deg. on either side of the correct setting.

A manufacturer engaged in fabricating fences from wire has signed a stipulation agreement with the Federal Trade Commission to cease and desist from alleged misrepresentation in advertising. It is charged that a picture of the character known and recognized as "Uncle Sam" was carried in advertisements along with the words "the fence Uncle Sam recommends." Another assertion was that the wire was "just double the strength" of ordinary wire and "double galvanized." The Federal Trade Commission said it found these statements misleading.

A cast semi-steel pulley has been added to its line by the W. A. Jones Foundry & Machine Co., 4401 West Roosevelt Road, Chicago, as a product of high dependable strength, even wearing qualities and good appearance.

This Issue in Brief

Profit trend for large manufacturers has been clearly upward, investigation reveals, while average profits of smaller manufacturers (under one million annual net income) have changed little in past five years.—Page 687.

* * *

Chromium-covered sheets may be fabricated without cracking surface, manufacturer claims. The base is rolled zinc, on which copper, nickel, and then chromium are bonded, not plated on.—Page 729.

* * *

Cuts cost of cleaning castings by hydraulic method. Foundry, situated on river, uses ordinary fire hose; solves labor problem, eliminates accidents caused by flying fins and sand, cleans cores more thoroughly, and lessens work to be done by sandblast operator. But hydraulic method is economical only where a river is handy.—Page 734.

* * *

Fires boilers with either blast furnace gas or pulverized coal. In blast furnace plant gas is automatically fed to boilers when pressure is high and is shut off when pressure falls.—Page 688.

* * *

Endurance of leaf spring steel almost tripled by grinding surface. Spring steel of 0.6 per cent carbon has a fatigue range of 30,000 lb. per sq. in. in ordinary forged and heat treated condition. Grind 1/16 in. off the surface, thus removing all microscopic hardening cracks, increases strength to 85,000 lb. per sq. in.—Page 692.

* * *

Open-hearth tapping difficulties are eliminated by tilting furnace. In stationary furnace hard taps frequently require 10 to 30 min. to get the metal started in the ladle, causing production loss and

oftentimes spoiling the heat. In tilting furnace the taphole is on a level with slag line and is usually opened a half hour before heat is ready to tap.—Page 692.

* * *

Sheet prices are likely to advance, says Doctor Haney. He believes they are too low in relation to other finished steel products.—Page 696.

* * *

New production record will likely be set by automobile industry for 1928. Indications are that the previous record of 4,424,538 cars and trucks, established in 1926, will be surpassed. August output was 485,000 units (estimated).—Page 731.

* * *

Chromium steel bridge members found to be in excellent condition after 60 years' service. Eads bridge over Mississippi River at St. Louis, first steel bridge in America, reveals no signs of corrosion or overstrain.—Page 684.

* * *

Though United States wages are more than twice those paid in Europe, labor cost in this country is a smaller item in whole cost of rolling steel than abroad. Here labor cost is about 38 per cent of the total, in England about 43 per cent, and on the Continent 45 per cent.—Page 692.

* * *

Automobile transportation cost reduced by Lake steamer shipment. Special automobile boats accommodate 650 cars. No blocking or bracing is necessary. Cars are loaded under their own power, unloaded at Lake port destinations and shipped to final destination by rail or truck.—Page 689.

Steel testing in the '70s was a hazardous occupation. Forged steel bolts, for use in Eads bridge at St. Louis, wrecked the testing machine and endangered the lives of testing crew.—Page 733.

* * *

Better steel at lower cost is made in tilting furnace, says open-hearth man. Production of soft and high and raw melting heats can be avoided, faster time per heat can be made, there is less danger of breakouts, and less bottom trouble, he declares.—Page 693.

* * *

Even with decreased percentage of profit relative to selling price, total profits of big manufacturers has grown greatly, because of higher productive efficiency and larger volume of consumption.—Page 688.

* * *

Foresees even level of business in steel-consuming industries for some months. "It is probable that (steel) consumption will fall little below the present level during remainder of 1928," says Doctor Haney.—Page 695.

* * *

Record in machine tool sales since first half of 1920 established in August, says National Machine Tool Builders' Association. Indications are that the total for September will equal, if it does not exceed, that of August.—Page 735.

* * *

Improved qualities imparted to metals by heat-treating and work-hardening are permanent, tests reveal. If metal is properly made, protected from corrosion, and not overworked, it will serve its purpose indefinitely.—Page 702.

Editor

THE IRON AGE

W. W. MACON
Managing Editor

ESTABLISHED 1855

True as Steel; Strong as Iron

CERTAIN facts suggest the question, "Are the strength and toughness of sound metal really permanent?" For instance, wrought brass bowls resting on a shelf have been found cracked. Die-cast meter cases shipped to tropic ports have disintegrated. Samples of duralumin strip laid away in a desk drawer have become brittle. Springs or axles which have successfully withstood bumpy roads for years break off short under relatively small shock. Can the builder of a monumental structure rely on any metal for indefinite service?

A metallurgist would have no hesitation in saying "Yes" most emphatically, yet he would have a hard time to prove that his answer was based on facts rather than faith. He would point out that the greatest enemy is corrosion, "the ravages of time," weathering; that all building materials need protection from the elements. Mysterious failures of metals, like those cited above, have always been shown to be accompanied by corrosion and severe stress. The metallurgist would extrapolate these facts into the conclusion that if the metal is properly made, protected from corrosion, and not overworked, it will serve its purpose indefinitely.

Such reasoning does not convince the doubter as would records of long-time performance. But long-time records do not exist, simply because steel, today the all but universal metal, was first used for structural members sixty years ago. Actual experience dates back a relatively few years. So it is doubly fortunate that the first bridge in America to use steel in its main ribs has been minutely examined recently and certified to be "in excellent physical condition and amply safe for the loads and service it is called upon to carry and is carrying."

The Eads bridge, described in the first article in this issue, is a monument to the universal experience of mankind, crystallized into the common phrases "true as steel," "strong as iron."

The record of the Eads bridge is doubly important because the steel in it is alloy steel. Sixty years ago the engineer's trust was in wrought iron, and only slowly did constructors accept the stronger metal made by alloying a little carbon with the iron. We have now accepted steel as a suitable material of construction, but civil engineers are less anxious to place dependence on alloy steel, especially if heat treated. Mechanical engineers have become acquainted with it, and use it in large quantities every day in important machine parts where failure would endanger human life. To civil engineers the Eads bridge should be the best evidence of the permanency of the improved properties of low-

carbon structural steel secured by the addition of a little alloying metal and by a simple heat treatment. Carbon improves iron and makes steel. Other metals improve steel and make alloy steels heat-treatable. Both improvements are permanent.

Some support for these statements may be had from an examination of old metal. The only ancient steel existing today is in tools and swords. Of course, cutlery is made of much higher carbon steel than the structural grade. But all the old steels have been hardened and consequently may shed some light on the question, "Are the effects of heat treatment permanent?" A sword is hardened and tempered to a delicate point, and in the parlance of the physical chemist is in a much more metastable condition than a heat-treated structural steel would be. Consequently if there is any tendency to change with time, the microstructure and the physical properties of ancient blades should show marked deterioration.

Fortunately Japanese scientists at the Imperial University have made a careful study of these points, and Dr. Kotaro Honda concludes that the Masamune swords made some 600 years ago are superior to anything made today, both in original sharpness and durability. Fragments of a sword from an old tomb probably 1200 years old show the expected microstructure of fine-grained martensite with no traces of its well known decomposition products, even when examined at 1000 diameters. The Shore scleroscope hardness of this fragment varies from 58 to 68. Eleven other very old swords were tested with the following results: Maximum hardness 83, minimum 53, mean 66 (all Shore scleroscope numbers). Since these results are within the same range as those found on much more modern blades, Professor Honda and his associates conclude that "Japanese swords found in old tombs do not undergo any change of structure (other than corrosion) during several hundreds of years, or even over one thousand years."

Here are no signs of internal decay.

In conclusion, it might be pointed out that civil engineers have used successfully large quantities of steel in a condition which mechanical engineers would avoid. We refer to the wire in suspension bridge cable. It is work-hardened to a high degree, and experience with non-ferrous alloys particularly shows that work-hardening is a common cause of spontaneous failure through "season cracking." Well made bridge wire fortunately is immune from this trouble. Work-hardening, so far as is known, is also just as permanent as hardening by heat treatment (and when we say hardening we also mean strengthening). Thus, H. C. Boynton, metallurgist of John A. Roebling's Sons Co., has tested

bridge wire after nearly 75 years' service and concludes that "cold-worked iron installed 75 years ago has not lost its valuable physical properties since the bridge was erected."

Penetrating the Tropics

INDUSTRIALIZING the tropics has been commonly regarded as waiting on the biologist. It is not alone sufficient to subjugate insects that beset humans, and generally to render sanitary and healthful the vast land areas in those zones. Also, those pests are to be conquered which are deadly to the plant life that must flourish in quantity sufficient to support larger populations and leave exportable surpluses. Pending the results of scientific research into diseases of tropical animals and plants, man seems steadily to be penetrating from the temperate zones by way of the automobile. Growth in the popularity of the latter has led to the betterment and extension of roads, and the automotive vehicle, truck as well as passenger car, is a spur to the investigations of the hygienist and the plant-life expert.

Thus whole countries with vast unopened areas seem likely sooner or later to become road-minded. Brazil, for example, has a president who was a good-roads enthusiast as head of the State of Sao Paulo and is now making road-building a major activity of the Federal Government. Next year that country will be host for the Pan-American Highway Congress and will exhibit two arterial highways, one 500 kilometers long connecting Rio de Janeiro and Sao Paulo.

It is logical to say that, given highways for ready collection of produce by motor trucks, trunk-line railroads may follow, that meanwhile repair shops must be provided and at length will come manufacture for local needs or from local materials. Granted that all this is a long look ahead, yet it is well to vision the conquest of the tropics as not alone the task of the biologist, but a development in which established industries in temperate zones will figure in a large way.

Farm Politics and Economics

IT is pathetic how the politicians essay with their palliatives to solve the farm problem, which is well known to be insolvable except by the natural operation of economic law. Intelligent thought on the part of the doctors boils down to the simple formula of co-operation as the only prescription they can offer. A good expression of this is made by William M. Jardine, Secretary of Agriculture, who said recently:

We must eliminate the waste between the farmer and his market and increase the profit to the producer without increasing the cost to the consumer. There must be organized competitive selling of the main commodities produced on the farms. The parasites of agricultural marketing must be weeded out and able and efficient men left to conduct the marketing.

This really does not mean as much as it seems to mean. The marketing of agricultural products is already done in a competitive way by able and efficient men. The transportation of agricultural products is conducted by able and efficient railroad men on terms that afford but small return to their stockholders. How is cooperative marketing going to squeeze out any waste

or get more money for the farmer without increasing the cost to the consumer?

The farmers could have had an act of Congress aiding them in cooperation at any time during the administration of Mr. Coolidge when they wanted it. Their professional exponents were under no illusions, however, and wanted the McNary-Haugen bill, which would have given to the farmers money at the expense of other taxpayers, knowing that such is the only way. The phantom of extracting a profit out of a conjectural waste does not intrigue them.

Under either Mr. Hoover or Mr. Smith we shall probably have an agricultural cooperative program. Yet we may well doubt that cooperative marketing as politically devised will be as efficient as the competitive individualism that now prevails. There are no easy pickings. The fittest survive; the most inefficient become insolvent, and the ordinarily inefficient eke out a bare living, as in every other competitive business.

Will Rogers, who pretends to be running for President on the platform of the "Anti-Bunk" party, states his position on farm relief in the following way:

I am the only candidate running this year that ever looked a mule in the face, and I know I can't do anything for the farmer. The only difference to him if he votes for me is that he'll be disappointed earlier than if he votes for either of the recent farmers on opposing tickets.

This is an expression in a nutshell of the common sense of the matter.

Finding Profits in Prosperity

AT a time when the major political parties are at grips over the existence of prosperity, more facts than usual are available regarding the trend of profits in American industry. The results of a broad study of industrial profits were presented recently before the National Association of Cost Accountants in a paper by Harry A. Bullis, abstracted elsewhere in this issue. The author arrived at the following conclusion:

Although profits have declined for all companies in certain industries, and for some companies, especially the smaller units, in many industries, profits in industry as a whole have not declined, but have been on somewhat of an upward trend.

Mr. Bullis's survey was general, touching virtually all fields of manufacture. However, since it covered a relatively small percentage of the total number of industrial companies, the conclusiveness of his deduction may properly be questioned. He addressed inquiries to 7500 manufacturers. From the replies he selected 300 that were complete in their answers to his questionnaire. To these he added 350 financial reports from corporation service agencies, also a study of Federal corporation tax returns.

Despite the incompleteness of the data, they definitely show that "profitless prosperity" is an unwarranted description of the business situation. No general economic condition, affecting all industries alike, is preventing profitable operations. On the contrary, a marked unevenness of results is indicated in graphs depicting the trend of net income in different industries. Complete balance in the business situation has been lacking ever since the war, and depression in specific fields is reflected in the income curves.

Much of the discussion of smaller profits, in Mr. Bullis's opinion, refers to a declining margin of return on each sales dollar. If this view is right, it helps to explain the better profits found for the greater corporations, which handle a far larger volume of business than their smaller competitors. It also emphasizes the need for further economies in distribution.

World Gains in Steel Output

EUROPE gained 2.2 per cent in steel production and North America 14.8 per cent, comparing production in the first half of this year with the average rate in the whole of 1927. The gain in the two continents was 8.3 per cent. Both the United Kingdom and Germany had losses, however. The detailed showing below includes such European statistics as are available:

	Monthly, First Half 1928, Gross Tons	Change From 1927 Average, Per Cent
United Kingdom	715,000	— 5.6
Germany	1,299,000	— 3.0
France	758,200	+11.8
Belgium	313,700	+ 2.9
Saar	167,400	+ 7.7
Luxemburg	208,500	+ 2.9
Italy	146,300	+13.2
Russia	345,700	+13.7
Poland	108,400	+ 5.6
Total	4,062,200	+ 2.2
United States	4,168,000	+14.3
Canada	108,000	+43.0
North America	4,276,000	+14.8
Grand total	8,338,200	+ 8.3

A certain allowance should be made from the showing of the above figures, since the United States regularly has a heavier production in the first half of a year than in the second half, whereas other countries do not show that variation. The divergence in the United States this time is particularly strong, for the second half of last year was an unusually poor second half.

The figures do not reflect any influence from the European cartel. Germany is in it and the United Kingdom is out of it, but both lost. The United States and Canada are out of it and both gained.

The growing countries are readily picked out—chiefly France, Italy and Russia. In the case of Russia there is merely a coming back, for Russia is still below her 1913 rate. Germany is down from 1913, on account of division of territory, while Poland is also down, about 19 per cent.

Italy's production this year is chiefly a gain upon last year. There is little advance from 1926 and 1925, though nearly a doubling since 1913. Production there is under adverse circumstances, for while Italy produces a large part of its iron ore it produces little fuel, and that almost entirely lignite. Substantially all coal is imported as well as some coke, a moderate amount of pig iron and a large amount of scrap.

The total in the above table falls quite short of representing the world's steel output, for several European countries are omitted and there is production in Asia, Australia and South Africa.

Get Out the Vote

ATTENTION has been drawn repeatedly to the failure of a large percentage of American citizens to exercise their right to vote. It is a common experience that the total vote cast is only about 55 per cent of the possible. Likewise repeatedly there are urgings to voters to do their duty. Indeed, we believe there is a Get-out-the-vote civic organization.

We do not deprecate the indignation that is worked up on this subject. We say emphatically that everyone who is entitled to vote and can do so intelligently ought to do so. Nevertheless we may offer some extenuation for those who fail to vote.

Let us suggest immediately that the golf players who would spend an unbroken day on the links rather than take the trouble to visit the polls are relatively few in number. No doubt if we should include all sportsmen their total would be insignificant. We may also suggest that in some States the politicians who conduct our elections contrive to make the conditions unnecessarily onerous, especially some registration requirements. This in itself keeps a good many voters from exercising their right.

There is always a large number of citizens who refrain from voting, owing to their inability to express themselves conscientiously. Thus in the pending election many persons who would vote to uphold the economic principles of one or the other of the two great parties are in a dilemma in view of their stand in respect to the 18th Amendment.

We imagine, however, that the great explanation of non-voting is failure to understand the questions at issue, coupled with willingness to leave the decision to those who do understand (or think they do). It might as well be honestly recognized that a considerable part of our population deliberately does not want to vote.

Of the proposal to drive to the polls those who do not know how to vote or do not want to, it is to be said that balloting by such persons would be largely a matter of chance. Perhaps it is so in the case of many others. At all events we may reflect that a 55 per cent vote probably averages better in intelligence and thoughtfulness than would one of 100 per cent, and that if a compulsory voting system were ever enacted we might have results that we should not like. What is already evident in the present campaign is that in many States an unusual percentage of citizens will exercise their franchise in November, and the experience, particularly in the case of women, may tend to a permanent stepping up of the percentage of voters.

All predictions thus far about America's oil supply have been proved to be understatements, according to the Oil Heating Institute, 420 Madison Avenue, New York. In a recent publication entitled "What About the Supply of Fuel Oil?" the institute asserts that, notwithstanding increased demands due to the popularity of the automobile and the household oil heater, our petroleum reserves should prove ample for generations to come. Discovery of new oil fields and scientific improvements in working petroleum deposits and preventing waste have conclusively contradicted the early prophecies of an oil famine. Estimates of reserves made as late as 1926, it is stated, have proved far too low; by 1930 California alone will have produced more oil than the entire visible supply was supposed to be in 1923.

Protest Against Examiners' Report in Rate Case

WASHINGTON, Sept. 18.—The first exceptions to the report of Examiners Howard C. Faul and C. M. Bardwell in connection with the general steel rate investigation case were filed last week with the Interstate Commerce Commission by interests in Wisconsin and Michigan, which protested against the exclusion of that part of Official Classification territory along the west bank of Lake Michigan. In the excluded section are included Green Bay, Kewaunee, Sheboygan, Manitowoc, Two Rivers, and Marinette, Wis., and Menominee, Mich.

It was contended that the examiners erred by not proposing the same basis of rates for the excluded territory as was proposed for stations in the southern peninsula of Michigan and southern Wisconsin. The fifth class rate, governed by official classification, is now applicable to the iron and steel articles involved in the case between the towns named and official territory, it was pointed out. The same scale of rates, the statement urged, should continue to those points as applicable elsewhere in official territory and the scale of rates found reasonable allowed to apply to the west bank Lake Michigan ports.

Those filing the statement were the Green Bay Association of Commerce, the Kewaunee Chamber of Commerce, the Manitowoc-Two Rivers Traffic League, the Sheboygan Association of Commerce, the Menominee-Marquette Chamber of Commerce and the Manitowoc Shipbuilding Corporation.

Canada to Consider Steel Tariff Revision

TORONTO, ONT., Sept. 18.—Iron and steel will be subjects of inquiry at the next sittings of the Tariff Advisory Board, to begin on Sept. 25 at the board's headquarters at Ottawa, Ont.

On Sept. 27 and 28 there will be a hearing on the application by the British Empire Steel Corporation, Ltd., for a duty on coke; imposing of a duty on anthracite screenings; and abolition of the rebate on duty at present granted on coal imported for the manufacture of coke used in the melting of metals, and on coal for the manufacture of coke in by-product ovens.

On Oct. 2 and 3 a hearing will take place on the application of the Algoma Steel Corporation, Sault Ste. Marie, Ont., for revision of tariff item 1007, so as to render dutiable flat spring steel, steel billets, and steel axle bars when imported for the manufacture of springs and axles for automobile vehicles; revision of tariff item 1008, so as to render dutiable spiral spring steel, when imported for the manufacture of railroad spiral springs; insertion in the Customs Tariff of the following: "Steel in all forms and shapes, by whatever process made, and by whatever name designated, whether cast, hot or cold-

rolled, forged, stamped or drawn, containing nickel, cobalt, vanadium, chromium, tungsten, molybdenum, also manganese or silicon, when present in the steel in excess of 1 per cent manganese or 0.50 per cent silicon, or any other metallic content used in alloying steel—35 per cent ad valorem, general and British preference"; increases of customs duty on all sections of steel angles up to and including 6 x 6 in.; and on beams up to 6 in. and channels up to 7 in.

High Record in Fabricated Structural Steel

WASHINGTON, Sept. 18.—Bookings of fabricated structural steel in August totaled 274,467 tons, or 95 per cent of the monthly capacity of 288,610 tons of the 191 reporting firms. The August total of actual orders reported has not been exceeded since July, 1927, when the total was 280,613 tons, representing 92 per cent of the capacity of the then reporting firms.

On the other hand the computed bookings for August, 356,250 tons, exceeded that of July of last year, with 345,000 tons, and made a new high record. Bookings in July of the present year aggregated 238,350 tons, or 79 per cent of the capacity of 301,035 tons of the 214 firms that reported to the Department of Commerce. Computed shipments in August amounted to 300,000 tons, or 80 per cent of capacity, against 270,000 tons, or 72 per cent of capacity, in July.

Orders for the eight months ended with August were computed at 2,238,750 tons, against 2,013,750 tons for the corresponding period of last year. Computed shipments were 2,017,500 tons and 1,886,250 tons respectively.

Foundrymen Meet in Montreal

A number of the leading foundrymen in the Montreal district met at luncheon at the Engineers Club in Montreal on Wednesday, Sept. 12, and were addressed by Dr. Richard Moldenke, the eminent foundry metallurgist, on some of the new and interesting developments of the foundry industry. The meeting was arranged jointly by the Witherbee, Sherman & Co., Port Henry, N. Y., and their Canadian sales agents, A. C. Leslie & Co., Ltd., Montreal, Forrester B. Leslie of the latter company acting as chairman.

Following an interesting and instructive talk, the meeting was thrown open to discussion and questions in which several took part, including Charles A. Pascoe, Canadian Car & Foundry Co., H. J. Roast, Robert Mitchell Co., and T. F. Kelly, Witherbee, Sherman & Co.

This meeting was held to further a better understanding between foundrymen and blast furnacemen, as to how the latter can best meet the various foundry requirements, and it

was something new to the iron industry of the district. The main idea put forward was that while the furnaceman might be doing everything possible to operate efficiently his own plant, this was of little value to the foundryman unless the furnace made iron that would produce good castings. With quality as the main objective, the furnaceman wanted to know just where the foundryman had trouble, and what he therefore might require in the way of better or more suitable pig iron.

Scrap Dealers Organize in Connecticut

New England scrap dealers on Wednesday, Sept. 12, at a meeting held at the Tumble Brook Country Club, Bloomfield, Conn., for the purpose of meeting Benjamin Schwartz, director general of the Institute of Scrap Iron and Steel, took steps to organize a Connecticut chapter with headquarters in Hartford.

Among those attending the Bloomfield meeting were: George B. Doane, Perry, Buxton & Doane, Boston; Carlson & Bager, Northampton, Mass.; L. I. Alport and Cohen Brothers, Springfield, Mass.; B. Cotton and Edinberg & Bloomfield, and Joseph W. Rafferty, Worcester, Mass.; M. Katz, Suissman & Blumenthal and H. Katz, Hartford, Conn.; M. Gordon & Son, Norwich, Conn.; Samuel J. Liffitt, Ansonia, Conn.; P. J. Katz, Danbury, Conn.; Max Miller, Middletown, Conn.; S. Jacobs, Bridgeport, Conn.; Benjamin Epstein, Norwich, Conn.; Berkshire Iron Yard, Meriden, Conn.; I. Feigenbaum & Son, M. Kotkin, S. Shurberg, New Britain, Conn.; Harris Iron & Metal Co., Joseph M. Regan, New Haven, Conn.; Iron & Metal Co., Eastern Iron & Metal Co., New England Iron & Metal Co., United Steel & Metal Co., New London, Conn.; American Waste & Metal Co., Norwich, Conn.; Harris & Gann, South Norwalk, Conn.; F. Murphy, Silverman & Shanen, Stamford, Conn.; Albert Brothers, Commercial Iron & Metal Co., Samuel Goldman, Waterbury, Conn.; S. Kaslowsky, B. Manaker, Portchester, N. Y.; S. Blumenthal, S. Cooper & Son, Max Jacobs, M. Levine and Yale Rubin, Ansonia, Conn.

"The Manganese Steel" is the title of an attractively printed booklet issued by American Manganese Steel Co., 333 North Michigan Avenue, Chicago. It describes the history of high manganese cast steel, its properties, and the various uses to which it is put. Mention is also made of the electric furnaces used by the company, and the research laboratories.

The Drop Forge Supply Association will hold its annual dinner Wednesday evening, Oct. 10, at Bookbinder's Restaurant during National Metal Week at Philadelphia.

Iron and Steel Markets

Steel Price Situation Unsettled

Market Levels for Fourth Quarter Contracts in Doubt—
September to Equal August in Output—Further
Advances in Pig Iron

THE volume of business in iron and steel holds at a high level, but prices present a mixed picture. In contrast with further advances in pig iron and scrap, finished steel prices are unsettled.

The application of a Sept. 10 deadline for specifications in bars, plates, shapes and sheets was not so general as expected. Some third quarter contracts placed the limit at Sept. 15 and others at Sept. 20, while a number of mills imposed no restricting clause. As a result, many buyers are still able to draw against current quarter contracts, and others, not yet ready to commit themselves for fourth quarter, are either out of the market or are placing spot orders.

Such fourth quarter contracting as has been done in bars, plates and shapes points to lower prices than mills aimed at. Consumers taking too little tonnage to be regarded as in the preferred buyer class have been able to cover at 1.90c., Pittsburgh, suggesting that price, rather than 2c., as the probable general market level for the final quarter.

Willingness of mills to extend protections on plain material to steel fabricators, and a pliable attitude on automotive contracts for alloy steel bars are other complicating factors.

In sheets, heavy bookings will carry both mills and buyers well into the coming quarter, and price tests are deferred. It is conceded that specifying was sharply stimulated by the impending reduction in cash discount, even though that was not the case with certain consumers, such as manufacturers of stampings, who do not find it practical to stock material.

Sheet steel sales so far this month have probably been not less than a full month's production, which, added to unfilled orders of 498,023 tons as of Sept. 1, reported by the National Association of Flat Rolled Steel Manufacturers, indicates that mills are quite generally sold up well into November.

Steel production leaves little to be desired. With September more than half gone, little doubt remains that output for the 30 days will be fully as large as last month, when steel plant operations averaged 83 per cent. The rate in September, 1927, was 69 per cent.

The decline in steel demand from motor car builders noted last week proved only a temporary dip. Although some automobile companies plan to curtail operations or shut down for repairs about Nov. 1, releases of steel in the aggregate are again large, in keeping with efforts to turn out as many cars as possible before the expected winter lull in demand sets in.

Railroad buying gives signs of expanding. The Pennsylvania has exercised an option for 10,000 tons

of rails, and the Great Northern has placed 4000 tons of high-manganese rails. These orders are forerunners of the customary fall rail buying movement, which is expected to get under way soon. The Chesapeake & Ohio and the Norfolk & Western will each take bids on round tonnages of bars, plates and shapes this week.

Pipe line construction promises to continue as a major outlet for steel. Dallas, Tex., has contracted for a pipe line taking 4250 tons of plates, and the Texas Corporation will build a line from Oklahoma to Lockport, Ill., requiring 25,000 tons.

Pig iron prices are still advancing, although the bulk of fourth quarter contracting has been completed. At Chicago, St. Louis and Philadelphia prices have gone up 50c. a ton. Cleveland furnace prices for outside delivery are 50c. a ton higher, and Valley furnaces have marked up quotations on all grades except foundry iron 25c. to 75c. a ton.

Heavy melting scrap at Philadelphia has risen 50c. a ton, following an advance of \$2 a ton in the previous week. Higher prices have been named in other market centers, but the upward trend has lost momentum. At Pittsburgh, recent purchases of scrap are explained, in part, by the desire of consumers to stimulate shipments against contracts at lower prices.

Structural steel lettings for the week are large. Including 26,000 tons for New York subways, the total is 49,000 tons. Prospective work includes 6000 tons for a department store in Minneapolis, 5000 tons of plates for oil tanks in California, 4500 tons for a glass manufacturing plant at Crystal City, Mo., and 3500 tons for a Mississippi River dam near St. Paul.

Computed bookings in fabricated structural steel in August, at 356,250 tons, made a new record, exceeding the previous peak month, July, 1927, by 11,250 tons. The gain over July, this year, was 60,000 tons.

A firmer world market in tin plate, a sequel of the recent understanding between Welsh and American mills, is reported from England by cable. Stronger prices for both pig iron and steel on the Continent are reflected in heavier domestic demands on British producers.

Copper advanced on Sept. 15 to 15c. a lb., the highest price since January, 1925. Sales in the first half of September totaled 125,000 tons, of which 80,000 tons was to domestic consumers. Tin has also been active, sales in the past four weeks totaling 6500 tons.

THE IRON AGE composite price for pig iron has advanced for the third time in four weeks. At \$17.63 a ton, it is within 12c. of the year's high, which came in February. The finished steel composite remains for the seventh week at 2.348c. a lb.

September Steel Production Will Equal That of August— Price Advances on Finished Products Not Well Established

PITTSBURGH, Sept. 18.—Steel orders and production remain at the high rate of the past month or more and, with September more than half gone, it is now safe to say that this will be quite as big a month as August and will make a particularly favorable showing with September, 1927, when both demand and output were on the downgrade.

The falling off in demands from the motor car builders, noted a week ago, proves to have been only a lull, as tonnage releases from that quarter again have been large and urgent in the past week. Automobile builders seemingly are determined to get out as many cars as possible before the demand slackens. It is well established that demand for cars is chiefly in replacements, and the usual experience is that those who do not replace old cars by the fall seldom do so until the winter is over.

The lower rate of discount for cash, which becomes effective on sheets and cold-rolled strips on Oct. 1, has been a strong factor in driving in specifications for those products. Business in bars, plates and shapes has been stimulated by the limitations which some, not all, manufacturers imposed as to the time they would accept specifications on third quarter contracts. Quite apart from those facts, however, has been the record breaking activity of

the automotive industry, an unusual high rate of production by agricultural implement manufacturers and a sustained demand for structural steel from the building industry, while the oil and gas industry has contributed a goodly amount of seamless well pipe and welded pipe line.

From the standpoint of business and steel plant engagement, a more satisfactory situation would be hard to imagine. On the score of prices, the

market leaves much for steel makers to desire. While advances have been announced in bars, plates, shapes, sheets and strips, it is observed that the last-named product has failed to make the gain and those in the other lines are not definitely established. The idea that advances would meet with little or no resistance appears to have been false, as some large buyers are contesting.

Increased mill buying of scrap has brought about no further advance in that commodity, probably because the purchases were dictated by the fact that they were not getting anywhere near full shipments against older and lower-priced purchases and the new commitments were what a few years ago were called a "marrying" of contracts. Generally higher prices are asked for pig iron, but there is not enough demand to provide a test. Greater activity in beehive coke is seen in a firmer, but not appreciably higher, market.

Pig Iron.—The Youngstown Sheet & Tube Co. has announced prices of \$17, Valley furnace, for No. 2 foundry and basic iron, \$17.50 for malleable and \$17.50 to \$18 for Bessemer. These prices, which represent advances in all except foundry iron of

from 25c. to 75c. a ton, also have become the quotations of most other producers serving this market, but only in the case of foundry iron, and then on very small lots, have they found basis in actual sales. So many of the larger consumers are covered on their requirements for the remainder of the year, that the demand is chiefly from the single carload buyers and no real test of prices is afforded. For the present, the new prices may be regarded as indicative of the attitude of producers rather than as a basis established by sales. The market is firm, because merchant producers are fairly well sold up at prices that are unprofitable and they naturally want to raise their averages on any additional business they may take. Hence, they are not forcing sales. The steel companies are finding a need for most of their iron production at present and selling pressure from that direction also is light, although the suggestion is heard that cold iron stocks are by no means small on steel company furnace yards and that the steel companies have come to the belief that low prices for pig iron have been one of the reasons for difficulty in raising finished steel prices. The Sharpsville, Pa., furnace of the Davison Coke & Iron Co., which has been idle since June 4 last, will be blown in Oct. 1.

Prices per gross ton, f.o.b. Valley furnace:

Basic	\$16.25 to \$17.00
Bessemer	17.25 to 17.50
Gray forge	16.50
No. 2 foundry	17.00
No. 3 foundry	16.50
Malleable	17.25 to 17.50
Low phos., copper free....	26.50

Freight rate to Pittsburgh or Cleveland district, \$1.76.

Semi-Finished Steel.—Fourth quarter prices of billets, slabs and sheet bars are not yet clearly defined. While producers generally have indicated that they would seek higher prices and several have announced \$33 as the price on sheet bars for the final quarter of the year, there has been no definite word as to billets and slabs. It is noted that makers still are taking specifications on contracts carrying a price of \$32, Pittsburgh, and the fact that buyers can specify

until the end of the month probably means that they will be able to secure next month's requirements at that price. Wire rods are steady at \$42, base, Pittsburgh or Cleveland, and are moving well.

Rails and Track Supplies.—Not much 1929 standard-section rail business is going on mill order books, but the distribution of such orders is likely at any time within the next 30 days. Track supplies are only moderately active. Light-section rails are dull.

Wire Products.—Nail business is slow, but there is a good movement of plain wire, and barbed wire and fence are doing fairly well. Marked decrease in the use of coated nails is noted, compared with that of a few years ago. Supplanting of wooden boxes by cardboard containers is responsible.

Tubular Goods.—Demand continues good for seamless pipe for deep oil wells and makers are maintaining substantially full operations of mills. There is a parallel situation in line pipe, but demand for welded oil country pipe is light and the call for butt welded pipe for building and construction work is steady rather than active.

Sheets.—No appreciable letdown is noted in the demand for sheets, although the volume of specifications has lessened with the passing of the date on which mills would accept them for shipment before the lower rate of discount for cash in 10 days became effective. Some effort has been made to get the mills to accept more business that would carry a discount of 2 per cent for cash, but without success, since most mills have all the tonnage they can possibly turn out this month and few will have completed shipments until after the turn of October. An order for 1000 tons of automobile body sheets has been seeking some mill that would ship it before the lower discount became effective. While any tonnage specified for shipment this month that goes out in the first part of October will carry the 2 per cent cash discount, the mills are firm in their adherence

to the lower rate on all other business. With the third quarter now commonly regarded as completed, stronger efforts are being made to obtain the higher prices announced on fourth quarter tonnages several weeks ago. These prices are 2.75c., base Pittsburgh, for black, 3.50c., base, for galvanized and 2c., base, for blue annealed. Some mills, however, are committed on part of their probable fourth quarter production at recent prices. Mill operations have increased in the effort to get out the orders stimulated by the desire to escape the lower discount rate and several plants of American Sheet & Tin Plate Co. last week operated 17 turns instead of the usual 16 turns.

Tin Plate.—Mill operations are receding as orders run out. While the weather lately has been favorable for growing and probably has added to the yields of a good many packing crops, the fact that no supplementary tin plate business has developed means that container manufacturers are well supplied. There is nothing new as to prices and probably will not be until along about the middle of November, when can makers must know the price on which they will figure 1929 business.

Cold-Finished Steel Bars and Shafting.—Specifications, which lagged a little in the previous week, have increased again. There is still some resistance to 2.20c., base Pittsburgh, which makers have announced as the fourth quarter contract price, but there is no evidence that makers are yielding in this demand, which represents an advance of \$2 a ton over the third quarter price.

Bars, Plates and Shapes.—It develops that not all third quarter contracts for these products stipulated that specifications against them were to be in by Sept. 10; some made the deadline Sept. 15, others Sept. 20 and a number were written that did not contain any limiting clause. The result is that a good many buyers still are able to draw on third quarter contracts. This situation has made difficult the efforts of producers to obtain the higher fourth quarter prices an-

Chromium Nickel Vanadium	1.50	4.25
Carbon Vanadium	0.95	3.70

Above prices are for hot-rolled steel bars, forging quality. The ordinary differential for cold-drawn bars is 1c. per lb. higher. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis. For billets under 4 x 4 down to and including 2½ in. squares, the price is \$5 a gross ton above the 4 x 4 billet price.

Slabs with sectional area of 16 in. or over carry the billet price; slabs with sectional area of 12 in. to 16 in. carry a \$5 extra above the billet price and slabs with a sectional area under 12 in. carry the bar price.

Band sizes are 40c. per 100 lb. higher.

Rails

Per Gross Ton

Standard, f.o.b. mill.....	\$43.00

2½ to 4	57	46½	46½	2½	29	15	
4½ to 6	56	45½	45½	4½ to 6	23	14	
7 to 8	52	39½	39½	7 to 8	21	7	
9 and 10	45	32½	32½	9 to 12	16	2	
11 and 12	44	31½	31½				

On carloads the above discounts on steel pipe are increased on black by one point, with supplementary discount of 5%, and on galvanized by 1½ points, with supplementary discount of 5%. On iron pipe, both black and galvanized, the above discounts are increased to jobbers by one point with supplementary discounts of 5 and 2½%.

Note.—Chicago district mills have a base two points less than the above discounts. Chicago delivered base is 2½ points less. Freight is figured from Pittsburgh, Lorain, Ohio, and Chicago district mills, the billing being from the point producing the lowest price to destination.

Carbon, 0.30% to 0.40%, base.....	50
Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.	

nounced early in July. Some buyers, whose tonnage is hardly large enough to put them in the so-called preferred buyer class, have been able to place fourth quarter contracts at 1.90c., base Pittsburgh, which although \$1 a ton more than many paid in the third quarter, point to that price rather than 2c. as the probable general price for the final quarter of the year. It is said that mills have not turned a deaf ear to requests from structural steel fabricators for extensions of protections on projects on which they have quotations outstanding. Some large Detroit users of forging bars have not yet spoken as to their fourth quarter requirements and uncertainty as to carbon bar prices is creating some doubt as to the effectiveness of the recent advances in alloy steel bars. Three railroad inquiries for bars, plates and shapes will close late this week and next. The Chesapeake & Ohio will close for an indefinite tonnage, but not over 3000 tons, on Sept. 20, the Seaboard Air Line for a small tonnage on Sept. 22, and the Norfolk & Western for approximately 2500 tons on Sept. 27.

Hot-Rolled Flats.—Demand, which showed some tendency to lag last week, again is on the upgrade and tonnage releases to mills in this area for the first half of the month uniformly are running ahead of those for the same period in August. Prices are steady at the levels that ruled through the second and third quarters, an attempted advance having been defeated by the existence of some large contracts at those prices to the end of the year.

Cold-Rolled Strips.—Business again is active after showing some letup in the week immediately following Labor Day. There is a quotation of 2.85c., base Pittsburgh, but more commonly 2.75c., base, is being done.

Coal and Coke.—The furnace coke market is showing a little more life, and, while prices have not changed,

the undertone is stronger. An Eastern furnace has bought for the last quarter of the year, taking about 8000 tons a month, while a Valley furnace, which will be blown in Oct. 1 has ordered coke shipments to begin next Saturday, and another Valley furnace, which has been running on by-product coke supplied by a steel company, will in the next few weeks go back to beehive coke. Production is increasing merely in keeping with the larger demands, and spot offerings still are light and readily salable at \$2.75 per net ton at ovens. Spot foundry coke also is in better demand, but at the same price range as a week ago. There is some demand for coal for household use, but no general activity in coal, supplies of which still are very ample, and prices remain weak.

Old Material.—Great activity in the past week has not been accompanied by any marked change in prices. It is estimated that purchases by two steel companies in this district have aggregated between 65,000 and 70,000 tons of heavy melting steel, the business being done at \$16.75 and \$17. It became necessary for these mills to insure larger supplies, to give dealers fresh orders at much higher prices than they paid on previous purchases, against which the shipments were very light. Earlier purchases were made at from \$15 down to \$14, with an average of not far from \$14.50; as a result of the past week's sales, the average on all unfilled orders is about \$15.50. The short interest in this grade has increased. If supplies do not come out more freely under the new contracts, and if present steel works operations are maintained, there is groundwork for another advance. The common belief, however, is that supplies will be ample and that there will be a less insistent steel works demand after Oct. 15.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:

Heavy melting steel.....	\$16.75 to \$17.00
Scrap rails	16:00 to 16.50
Compressed sheet steel.....	16.50
Bundled sheets, sides and ends	15.00 to 15.50
Cast iron carwheels.....	15.00 to 15.50
Sheet bar crops, ordinary.....	16.75 to 17.25
Heavy breakable cast.....	12.75 to 13.25
No. 2 railroad wrought.....	16.50 to 17.00
Heavy steel axle turnings.....	14.50 to 15.00
Machine shop turnings.....	11.50 to 12.00

Acid Open-Hearth Grades:

Railr. knuckles and couplers.....	17.50 to 18.00
Railr. coil and leaf springs.....	17.50 to 18.00
Rolled steel wheels.....	17.50 to 18.00
Low phos. billet and bloom ends	20.00 to 20.50
Low phos., mill plates.....	18.50 to 19.00
Low phos., light grade.....	17.50 to 18.00
Low phos., sheet bar crops.....	18.50 to 19.00
Hvy. steel axle turnings.....	14.50 to 15.00

Electric Furnace Grades:

Low phos. punchings.....	17.50 to 18.00
Hvy. steel axle turnings.....	14.50 to 15.00

Blast Furnace Grades:

Short shoveling steel turnings	12.50 to 13.00
Short mixed borings and turnings	12.50 to 13.00
Cast iron borings	12.50 to 13.00
No. 2 busheling	11.00 to 11.50

Rolling Mill Grades:

Steel car axles	18.50 to 19.00
No. 1 railroad wrought.....	12.50 to 13.00
Sheet bar crops.....	17.50 to 18.00

Cupola Grades:

No. 1 cast	15.00 to 15.50
Rails 3 ft. and under.....	16.50 to 17.00

Increases Group Insurance

An increase of approximately \$3,500,000 in group life insurance covering employees of the Allegheny Steel Co. and the Allegheny Coal & Coke Co., affiliated corporations of Brackenridge, Pa., has been announced, bringing the total of such insurance carried by the companies to more than \$7,000,000. Since October, 1922, beneficiaries of the Allegheny Steel and Allegheny Coal & Coke employees have received from the insurance company a total of more than \$112,000 in death benefits, while an additional \$8,000 in total and permanent disability claims has been approved for payment.

The general employees are separated into two salary classes, those in one receiving \$1,000 insurance and those in the other \$2,000. A somewhat higher scale of additional insurance is provided for executives, superintendents and assistant superintendents.

Included in the life insurance policy is a clause which guarantees the payment of an employee's insurance in full if he becomes totally and permanently disabled before age 60. These payments are made to the employee in monthly installments.

In addition to the actual protective provisions, the group program includes a visiting nurse service and the periodical distribution of pamphlets on disease prevention and health conservation.

Aeronautical engineering classes, headed by Lieut. E. D. Koger, U. S. N. R., with plane parts from the U. S. Navy air station at San Diego used for demonstration purposes, are in the program of the College of Engineering of the University of Southern California. Cooperating agencies include Harry Guggenheim, president Guggenheim Fund for the Promotion of Aeronautics; William P. MacCracken, Jr., Assistant Secretary of Commerce in charge of aviation; Major Clarence M. Young, Director of Aeronautics, Department of Commerce, Washington; Harris M. Han-shue, president American Air Transport Association; James G. Woolley, traffic manager Western Air Express, and John C. Simpson, general manager Airport Engineering Service Co.

How to develop production engineers will be one of the subjects discussed by the production meeting of the Society of Automotive Engineers, to be held at the Book Cadillac Hotel in Detroit, Nov. 22 and 23. Other subjects under consideration for papers are welding, honing, gear making and power transmission standards. A paper on the methods which give the Ford Motor Co. its low production costs will be read by John Younger, Ohio State University.

Chicago

Prices on Plates, Shapes and Bars Now Range From 2c. to 2.10c.—Pig Iron Again Advanced 50c. a Ton

CHICAGO, Sept. 18.—Prices now quoted on plates, shapes and bars by Chicago sellers are based on figures in third quarter contracts plus \$2 a ton. The new quotations are 2c. to 2.10c. per lb. This policy indicates that there will be no narrowing of the circle of preferred buyers, but if maintained it will give the mills a better margin of profit. Notwithstanding that current specifications are the best since March of this year and that spot sales, usually in small lots, bulk fairly large, there is a feeling of uncertainty as to what October will bring in the steel business. Heavy backlogs, except in sheets, are absent and consumers are intently watching the trend of industrial activity. Caution is noticeable, and it is only the occasional buyer who openly states requirements for the remainder of the year.

Demand for semi-finished steel shows some improvement, specifications for sheet bars being large because of the needs of the automobile industry. Orders for railroad equipment are light and railroad shop operations are unusually low. There is no tangible basis for reports that car buying will increase in the fall and early winter months. Architects are busy, but few of their plans get beyond the preliminary stage. Meanwhile, building permits are less numerous and fabricators are concentrating on old projects, some of which are more active.

Pig Iron.—Chicago producers of Northern foundry iron advanced prices 50c. a ton on Friday. Sales during the week were in fair volume. Shipments are expanding, and, with all furnaces in the immediate vicinity of Chicago lighted, deliveries are in excess of production and furnace stock piles are growing smaller. Total sales in the first 18 days of September were about equal to those of the corresponding period in August, while shipments were fully 10 per cent heavier in the current period. A user in central Illinois is in the market for 500 tons of foundry and malleable iron. Sales of silvery iron total over 2000 tons and prices are holding; shipments against contracts are heavy. Southern iron at \$16.25, Birmingham, now reaches Chicago only by an all-rail rate, which is \$6.01 per ton. The charcoal iron market is moderately active.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25..	\$18.50
N'th'n No. 1 fdy., sil. 2.25 to 2.75..	19.00
Malleable, not over 2.25 sil.....	18.50
High phosphorus	18.50
Lake Super. charcoal, sil. 1.50....	27.04
So'th'n No. 2 fdy. (all rail).....	22.26
Low phos., sil. 1 to 2, copper free	\$28.50 to 29.00
Silvery, sil. 8 per cent.....	29.79
Bess. ferrosilicon, 14-15%.....	46.79

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Plates.—Most sellers in this district are applying a \$2 advance in prices over those paid by consumers for their third quarter purchases. This means that the plan to name a single base price of 2.10c. per lb., Chicago, has been modified and that

fourth quarter quotations will range from 2c. to 2.10c. Some buyers are placing orders only for current needs. A few, whose needs are small in the aggregate, have signed contracts for the final period. Railroads are slow in making known their requirements, and there is little definite tonnage for oil tank construction in the market. A fair volume of plate mill output is going to pipe makers. It now appears that 110,000 tons of plates needed for one pipe order will not come to mills until certain legal matters have been cleared away. The Texas Corporation purposes to construct an oil line, requiring 25,000 tons of pipe, from the Southwest fields to Lockport, Ill. An indication of the dullness in car building shops is afforded by the fact that less than 1000 tons of steel was specified from this source in the week. A fair tonnage of plates is being used by bridge builders and steel building fabricators. Deliveries range from two to three weeks.

Mill prices on plates, per lb.: 2c. to 2.10c. base Chicago.

Ferroalloys.—Scattered sales of spiegeleisen are reported at \$32 to \$33, Hazard, Pa. Specifications for ferrosilicon are liberal, and releases against ferromanganese contracts are heavier.

Prices delivered Chicago: 80 per cent ferromanganese, \$112.56; 50 per cent ferrosilicon, \$83.50 to \$87.50; spiegel-eisen, 19 to 21 per cent, \$40.76.

Bars.—Bar mills in this district are heavily engaged and deliveries are not better than 20 to 30 days. This has been an unusually heavy week in specifications but new buying is light. Individual releases are larger, which is probably a reflection of higher consumption rather than a tendency toward building stocks. Cold-drawn bar makers are taking heavy shipments. Sellers are adding \$2 a ton to prices paid by consumers in the third quarter, bringing fourth quarter quotations to 2c. to 2.10c. per lb., Chicago. Fourth quarter contracting in alloy steel bars is progressing slowly. In the meantime, specifications are liberal and output is steady. Future requirements for iron bars appear to be of little concern to users. In a quiet market bar iron producers are withholding fourth quarter price announcements until

they are more certain of price trends of other bar commodities. Rail steel bar prices are strong at 1.85c. per lb. The bulk of fourth quarter contracts are signed and there is a fair sprinkling of spot business. Specifications are liberal, especially from the bed trade, which is getting busier as the fall season approaches.

Mill prices per lb.: Soft steel bars, 2c. to 2.10c., base, Chicago; common bar iron, 2c., base, Chicago; rail steel bars, 1.85c., base, Chicago Heights mill.

Structural Material.—Interest in this market is confined largely to old inquiries that have become more active. The South Park Commissioners will meet Sept. 19 to consider the award of 5000 tons for the Fine Arts Building, Chicago. The steel for the Patterson Estate Building, Chicago, amounting to 3000 tons, on which the American Bridge Co. is low bidder, may be placed before the end of this week. The consolidation of the Continental & Commercial National Bank and the Illinois Merchants Bank, both of Chicago, may result in the Continental Bank Building being vacated, in which case it may be used by the Board of Trade, which had planned a building requiring 14,000 tons of steel. Fabricators are getting higher prices, though the general level is not up to their expectations. Complaint is heard that shops are not meeting promised deliveries. Several large projects are being delayed on this account. Asking prices for structural material range from 2c. to 2.10c., Chicago. Orders have been taken at these figures from miscellaneous users, but tests have not been made on large tonnages and on the requirements of fabricators for specific jobs.

Mill prices on plain material, per lb.: 2c. to 2.10c. base, Chicago.

Sheets.—Sheet mill backlogs are the heaviest so far this year. Releases against contracts and orders for prompt shipment are keeping mills engaged at close to capacity. Moderate weather in the past week has materially improved working conditions in hot mills and output is more uniform and at a higher rate. Talk of a further advance in prices means little as producers are heavily booked for the fourth quarter, and, in view of reported stock building by users, they can look for little in the way of spot tonnages in the next 60 days. Notwithstanding strenuous opposition to the change in the cash discount, local sellers insist that it will become effective with the start of the new quarter.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 2.80c. to 2.90c.; No. 24 galv., 3.65c. to 3.75c.; No. 10 blue ann'l'd, 2.15c. to 2.25c. Deliv'd prices at other Western points are equal to the freight from Gary plus the mill prices, which are 5c. per 100 lb. lower than Chicago delivered prices.

Cast Iron Pipe.—The United States Cast Iron Pipe & Foundry Co. is low bidder at Milwaukee on 750 tons of 42-in. pipe. For the pipe alone, \$33, Birmingham, was bid and \$32 is the price asked if the plain pipe, lugged pipe and special fittings are all

awarded to this company. Chicago will close Sept. 24 on 2120 tons of 6, 8 and 12-in. pipe. The McWane Cast Iron Pipe Co. has taken 200 tons of pipe for Centerline, Mich. This market gives no signs of becoming much more active than at present until buying for winter manufacture gets under way.

Prices per net ton, deliv'd Chicago: Water pipe, 6-in. and over, \$42.20 to \$43.20; 4-in., \$46.20 to \$47.20; Class A and gas pipe, \$4 extra.

Rails and Track Supplies.—Chicago mills continue to produce at 50 per cent of capacity and schedules are arranged for three to four weeks. The Pennsylvania Railroad, exercising an option, has released 10,000 tons of rails to local mills. The Great Northern has purchased 4000 tons of high manganese rails, of which 2000 tons was taken by a Western mill. Among fresh inquiries is 3000 tons for the Detroit, Toledo & Ironton. Track fastening orders are unimportant except for 1000 kegs of spikes and bolts taken for immediate delivery. Rail mill repair programs will not be undertaken before the first part of October.

Prices f.o.b. mill, per gross ton: Standard-section open-hearth and Bess. rails, \$43; light rails, rolled from billets, \$36. *Per lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.15c.; angle bars, 2.75c.

Wire Products.—Light frosts in the Northwest have done little damage to late crops and the outlook for an active fall trade in wire products remains favorable. Both sales and specifications are spotty, and the general average for the country as a whole shows business to be less active than a week ago. Orders from the Northwest are more numerous but not heavy. Jobbers throughout the Central West and in the South are ordering more liberally in anticipation of the fall trade, but retailers in most localities report business dull. Specifications from the manufacturing trade are a shade heavier. The slightly lessened rate of shipments is enabling producers to complete round-

ing out stocks for the buying movement which they expect will get under way by Oct. 1.

Old Material.—The Chicago scrap market continues to lean to the strong side. Sales of heavy melting steel to consumers are lacking to support the upward movement which has affected the specialties. Brokers are paying \$13.50 a gross ton, delivered, for heavy melting steel, for which they have orders at \$13.25. The addition of two merchant iron stacks leads dealers to anticipate a stronger market for cast iron borings. Supplies seem adequate for immediate needs of consumers.

Prices deliv'd Chicago district consumers:

Per Gross Ton	
Basic Open-Hearth Grades:	
Heavy melting steel.....	\$13.00 to \$13.50
Shoveling steel.....	13.00 to 13.50
Frogs, switches and guards, cut apart, and misc. rails	14.75 to 15.25
Hydrcul. compressed sheets	11.50 to 12.00
Drop forge flashings.....	9.50 to 10.00
Forg'd, cast and r'l'd steel carwheels.....	16.50 to 17.00
Railr'd tires, charg. box size.....	16.50 to 17.00
Railr'd leaf spring cut apart.....	16.50 to 17.00
Acid Open-Hearth Grades:	
Steel couplers and knuckles	15.00 to 15.50
Coil springs.....	18.00 to 18.50
Electric Furnace Grades:	
Axle turnings.....	13.50 to 14.00
Low phos. punchings.....	15.00 to 15.50
Low phos. plate, 12 in. and under.....	15.00 to 15.50
Blast Furnace Grades:	
Axle turnings.....	11.00 to 11.50
Cast iron borings.....	9.75 to 10.25
Short shoveling turnings...	9.75 to 10.25
Machine shop turnings....	6.75 to 7.25
Rolling Mill Grades:	
Iron rails.....	14.75 to 15.25
Rerolling rails.....	16.00 to 16.50
Cupola Grades:	
Steel rails less than 3 ft.	17.00 to 17.50
Angle bars, steel.....	15.75 to 16.25
Cast iron carwheels.....	13.50 to 13.75
Malleable Grades:	
Railroad.....	14.50 to 15.00
Agricultural.....	12.50 to 13.00
Miscellaneous:	
*Relaying rails, 56 to 60 lb.	23.00 to 25.00
*Relaying rails, 65 lb. and heav.	26.00 to 31.00

Per Net Ton	
Rolling Mill Grades:	
Iron angles and splice bars	14.50 to 15.00
Iron arch bars and transoms.....	20.00 to 20.50
Iron car axles.....	24.50 to 25.00
Steel car axles.....	16.50 to 17.00
No. 1 railroad wrought....	12.00 to 12.50
No. 2 railroad wrought....	11.50 to 12.00
No. 1 busheling.....	10.00 to 10.50
No. 2 busheling.....	5.75 to 6.25
Locomotive tires, smooth..	12.50 to 13.00
Pipes and flues.....	9.00 to 9.50

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Reinforcing Bars.—Awards during the week were few except on small tonnage requirements. The lull in buying so far in September gives promise of ending, as several large projects which have been before the trade for some time are nearer closing. Fresh inquiry is slowing down, presumably because of the apparent tightening of loans for building construction. Contractors are busy and are pressing for delivery from shops which on the average are engaged at more than 85 per cent of capacity. Prices are unstable in spite of efforts to bring them up to former levels. Mills are asking

\$2 a ton more. New awards and recent inquiries are given on page 722.

Billets.—Contracts for fourth quarter delivery total 40,000 tons. Orders against old obligations are heavy and shipments are in increased volume. Prices for rerolling billets, 4 in. and over, range from \$32 to \$33 a gross ton. The lower price is most commonly quoted.

Warehouse Business.—Sales in August were a trifle better than in the same month a year ago. Some improvement was shown over July, but sales were small in the first two weeks in September. Stocks are well balanced but a trifle lighter than is usual at this time of the year.

Cold-Rolled Strip.—Specifications are in sufficient volume to maintain mill output at 85 per cent of capacity. Deliveries range from three to four weeks. Prices are steady at 2.75c. to 2.85c. per lb., Cleveland. The freight rate to Chicago is 32c. per 100 lb.

Hot-Rolled Strip.—Forward buying is assuming larger proportions at 2c. to 2.30c. per lb., Chicago. Specifications continue heavy, especially from the automobile trade.

Coke.—Producers of by-product foundry coke find production no longer meets the needs of users and stock piles are being drawn on. Prices are firm at \$8 a ton, local ovens.

Bolts, Nuts and Rivets.—Fourth quarter contracting is making headway, and it is now evident that the size of contracts for the final period will compare favorably with obligations in the past three months. Specifications are in smaller total volume. Railroads, in particular, are finding their needs less than in previous weeks.

August Output of Sheets Rises, Sales Decline

Production and shipments of steel sheets increased sharply in August while sales declined, according to a report of the National Association of Flat Rolled Steel Manufacturers, based on 70.1 per cent of the country's capacity. August sales were 254,397 tons, against 333,357 tons during the previous month. Production was 329,396 tons, against 267,685 tons, and shipments amounted to 324,691 tons, compared with 278,310 tons in July.

Unfilled orders Sept. 1 totaled 498,023 tons, a decrease of 52,445 tons for the month. August sales represented 71.7 per cent of capacity, production 92.8 per cent, and shipments 91.5 per cent. Unfilled orders Sept. 1 represented 140.4 per cent of capacity.

Stockholders of Steel & Tubes, Inc., Cleveland, at a special meeting Sept. 14, ratified the plans recently approved by directors of both companies to consolidate with the Republic Iron & Steel Co., Youngstown. Out of 90,000 shares 86,321 were represented in person or proxy.

Philadelphia

Last Quarter Steel Contracting Developing Slowly—Scrap Continues Upward Movement

PHILADELPHIA, Sept. 18.—Fourth quarter inquiry for bars and plates is developing, and some contracts for steel bars have been closed at 1.90c. to 1.95c. per lb., Pittsburgh. Plate consumers are asking for prices, but have not yet taken out contracts. Sheet contracts are less numerous than earlier in the month, as many users have covered their known requirements for the remainder of this year, so as to receive the benefit of the 2 per cent discount for cash, which terminates Oct. 1. Mills are heavily engaged, and in many cases are unable to offer better than three to four weeks' delivery on sheets. Bar mills are also well filled with tonnage and quoting deliveries of three and four weeks. Prices of shapes are substantially unchanged and little fourth quarter contracting is in evidence. Most mills are endeavoring to maintain a base of 2.05c., Pencoyd, or 2.11c., Philadelphia, but concessions have not entirely disappeared.

Iron and steel scrap prices continue to advance and practically all grades are 50c. to \$1 a ton higher than a week ago. No. 1 heavy melting steel has brought \$16 per ton on a purchase of several thousand tons by a large eastern Pennsylvania user.

Pig Iron.—Most consumers in this district have covered their requirements well into the next quarter, and with furnaces maintaining \$20, base, on the foundry grade, only occasional carload lots are being bought. Outstanding quotations at \$19.50 per ton, of which there were a number a week ago, have been withdrawn and furnaces are unwilling to shade \$20, furnace. The Worthington Pump & Machinery Corporation, Harrison, N. J., is inquiring for 815 tons of Bessemer iron, ranging from 1.50 to 3.50 per cent silicon. Following the purchase, reported last week, of about 25,000 tons of basic by a large eastern Pennsylvania user, the basic market is quiet. Furnaces are quoting \$19 to \$19.25 per ton, delivered, a slight increase from the level at which much of the recent basic buying was done.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.	\$20.76
East. Pa. No. 2X, 2.25 to 2.75 sil.	21.26
East. Pa. No. 1X.	21.76
Basic (del'd east. Pa.)	\$19.00 to 19.25
Gray forge	19.75 to 20.25
Malleable	21.00 to 21.50
Stand. low phos. (f.o.b. N. Y. State furnace)	22.00 to 23.00
Cop. b'rg low phos. (f.o.b. furnace)	23.00 to 23.50
Va. No. 2 plain, 1.75 to 2.25 sil.	24.54
Va. No. 2X, 2.25 to 2.75 sil.	25.04

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates; 76c. to \$1.64 from eastern Pennsylvania furnaces; \$4.54 from Virginia furnaces.

Bars.—Mills are operating at a high rate in most cases and some have

closed rolling schedules up to the middle of October. There is a fair volume of inquiry for fourth quarter and in the few cases where contracts have been made, 1.95c., Pittsburgh, or 2.27c., Philadelphia, is reported, with 1.90c., Pittsburgh, or 2.22c., Philadelphia, to preferred buyers.

Plates.—Plate buyers have not shown as much interest in the last quarter buying as have bar consumers, but there is some inquiry, and 2.05c. to 2.15c., Coatesville, or 2.15c. to 2.25c., Philadelphia, are the prices asked, depending upon the tonnage and the buyer. Makers are working on heavy specifications against present contracts and are maintaining prices with considerable firmness.

Shapes.—There is a fair volume of specifications, but the market has not registered an advance, although prices are slightly firmer. Quotations are 2.05c., Pencoyd, or Bethlehem, or 2.11c. to 2.18c., Philadelphia, but buyers claim to be able to obtain 1.95c., Pencoyd, when a desirable tonnage is placed. Fabricated steel bids are beginning to advance slightly for the first time in many months and this is expected by mills to aid considerably in maintaining the price on shapes.

Sheets.—As a number of consumers covered at least part of their fourth quarter requirements early in the month, interest in contracting has lessened. Specifications for September delivery have been heavy, buyers seeking to take advantage of the discount of 2 per cent for cash, which terminates Oct. 1. Mills are so well booked with tonnage as a result of this that deliveries range from four to five weeks. In the event that a mill is unable to make delivery of sheets specified for September shipment, it is stated that the 2 per cent discount for cash will

be extended to the buyer after Oct. 1. Prices are being maintained at 2c. to 2.10c., Pittsburgh, on blue annealed, 2.75c., Pittsburgh, on black and 3.40c. to 3.50c., Pittsburgh, on galvanized.

Warehouse Business.—Jobbers report a larger volume of orders than early in September. Sheet demand is fair, and, with mills beginning to offer extended deliveries, further improvement seems to be expected.

Imports.—In the week ended Sept. 15, arrivals of ore at this port totaled 12,012 tons, of which 6800 tons was iron ore from Algeria, 4560 tons manganese ore from Russia, 628 tons chrome ore from Portuguese Africa and 24 tons tungsten ore from Germany. Pig iron receipts consisted of 1019 tons of Indian iron and 69 tons of Norway iron. Steel arrivals were 575 tons of structural shapes, 556 tons of skelp, 573 tons of steel bars and 43 tons of steel bands from Belgium, 32 tons of steel bars and 19 tons of billets from Sweden and 14 tons of steel scrap from the United Kingdom.

Old Material.—Several thousand tons of No. 1 heavy melting steel is reported to have been bought at \$16 per ton by an eastern Pennsylvania consumer, whose requirements are exacting. Other grades show a corresponding advance in most cases. Heavy breakable cast has been bought at \$16.50 per ton, delivered, and a later purchase at \$17 per ton, delivered, is said to have been made by a Harrisburg, Pa., consumer. A Claymont, Del., mill has also paid \$16.50 per ton for this grade. Stove plate is quoted at \$12.50 per ton, and brokers are paying as much to fill contracts. Yard steel is quotable at \$12.50 per ton on a recent sale to a user in Harrisburg. Sales are mostly in small tonnages, because of the scarcity of supplies and the unwillingness of sellers to commit themselves in a rapidly rising market for more scrap than they have on hand.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel	\$15.50 to \$16.00
Scrap T rails	15.00 to 15.50
No. 2 heavy melting steel	12.00 to 12.50
No. 1 railroad wrought	15.00 to 15.50
Bundled sheets (for steel works)	11.00
Machine shop turnings (for steel works)	11.50
Heavy axle turnings (or equiv.)	12.50 to 13.50

New York

Low Quotations on Pig Iron Disappear—Little Steel Contracting for the Fourth Quarter

NEW YORK, Sept. 18.—Pig iron buying is now mainly in smaller tonnages, since most of the large consumers have contracted for their fourth quarter needs and are not yet interested in 1929 requirements. Sales in this district for the week, at 17,000 tons, included one lot of 5000 tons and another of 2200 tons. The contract for 5000 tons was taken by one of the last Buffalo furnaces to hold open a quotation of \$16.50, base, on foundry iron. The common quotation is now \$17, base, although it has not yet been tested by a sizable inquiry. Quotations of less than \$19.50, base furnace, on eastern Pennsylvania foundry iron have apparently disappeared. The Worthington Pump & Machinery Corporation, New York, is in the market for 2000 tons of various grades, including 815 tons for Harrison, N. J., 330 tons for Holyoke, Mass., 350 tons for Elmwood Place, Ohio, and the remainder for Buffalo. The New York Central Railroad wants 600 tons for its Frankfort, N. Y., shops. Shipments of barge iron from Buffalo are moving more freely, but there are few unchartered barges available before the end of the navigation season, so that new sales for water shipment have been checked. Foundry melt continues to improve.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil.	1.75
to 2.25	\$21.41 to \$21.91
*Buf. No. 2, del'd east	
N. J.	19.78 to 20.28
No. 2, del'd east. N. J.	
tidewater	19.51 to 20.01
East. Pa. No. 2 fdy., sil.	
1.75 to 2.25	20.89 to 22.02
East. Pa. No. 2X fdy., sil.	
2.25 to 2.75	21.39 to 22.52
East. Pa. No. 1X fdy., sil.	
2.75 to 3.25	21.89 to 23.02

Freight rates: \$4.91 from Buffalo, \$1.39 to \$2.52 from eastern Pennsylvania.

*Price delivered to New Jersey cities having rate of \$3.28 a ton from Buffalo.

Ferroalloys.—Sales of about 500 tons of spiegeleisen for delivery this year have been made during the past week and there have been carload and small-lot transactions in ferromanganese. Prices are unchanged.

Plates, Shapes and Bars.—A few fourth quarter contracts for steel bars have been made at 1.90c. and 1.95c., Pittsburgh and some of the smaller buyers have signed up at 2c., Pittsburgh, but practically no contracting has been done in plates and shapes. In the latter product there has been fairly heavy specifying against expiring third quarter contracts, but plate buyers seem to be in no hurry to take out the remainder of their third quarter obligations, with the result that specifications have fallen off noticeably in the last two weeks. The current price for plates is still 2.17½c., New York, or 2c. Coatesville, although Eastern producers are asking from 2.05c. to 2.15c. on fourth

quarter contracts. Structural steel awards are at a fairly good rate, and a large tonnage is pending. The American Bridge Co. has been awarded 26,000 tons for two sections of the New York subway, subject to approval by the Board of Estimate. Four pub-

lic schools, for which contracts have been awarded, will take a total of 3800 tons of steel.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.19c. to 2.24c.; plates, 2.17½c. to 2.22½c.; struc. shapes, 2.14½c. to 2.19½c.; bar iron, 2.14c.

Sheets.—Although sheet prices are not yet actually higher, as reflected by sales, some mills which are in a comfortable position have turned down offers from buyers at the prices which have recently prevailed, namely 2.65c., Pittsburgh, on black and 3.40c. on galvanized. The mills have large backlogs and are seldom promising better than four or five weeks delivery on the common finishes, while full finished sheets take longer. The new prices, 2.75c. on black and 3.50c. on galvanized, are nearer realization than they were a few weeks ago, but the fact that so many buyers have covered their requirements for the next 30 to 60 days precludes a severe test.

Warehouse Business.—Jobbers report a slight increase in the volume of orders for plates, shapes and bars. Black, galvanized and blue annealed sheets are only moderately active in this district, but prices are being fairly well maintained. The well-filled condition of sheet mill books has not been reflected by increased buying from warehouse stocks.

Coke.—Demand for both furnace and foundry grades of coke continues good. Prices are unchanged at \$2.75 to \$3 per ton, Connellsville, for standard furnace and about \$3.75 per ton, Connellsville, for standard foundry. Special brands are still quoted at \$4.85 per ton, ovens, or delivered into this district at \$8.56 per net ton to northern New Jersey, Jersey City and Newark and \$9.44 to New York and Brooklyn. By-product foundry coke prices are \$9 to \$9.40, Newark or Jersey City, and \$10.06, New York or Brooklyn.

Cast Iron Pipe.—Prices are unchanged at \$34 and \$35 per ton, base Birmingham, quoted by Southern makers, and \$35.60 to \$36.60 per ton, New York, quoted by Northern foundries. Buying is almost entirely of small lots by privately owned companies. A large utility company, which buys in New York, is inquiring for 240 tons of water pipe and another large company has closed on 135 tons of gas pipe with a Southern maker. Bids were opened yesterday and further bids are to be opened Sept. 19 and Sept. 21, by Hartford, Conn., on a total of 200 tons of water pipe. * An inquiry is in the market from Honolulu, Hawaii, for 1500 tons of 24 and 30-in. water pipe.

Prices per net ton, deliv'd New York: Water pipe, 6-in. and larger, \$35.60 to \$36.60; 4-in. and 5-in., \$40.60 to \$41.60; 3-in., \$50.60 to \$51.60; Class A and gas pipe, \$4 to \$5 extra.

Reinforcing Bars.—This market has been quiet during the last week and contractors are apparently in no hurry to take advantage of present prices, which are to be advanced \$2 a ton on Oct. 1. A fair amount of

new work has come out for bids and pending projects requiring 100 tons or more now amount to 9000 or 10,000 tons.

Old Material.—The upward movement of buying prices on practically all grades continues. Dealers and brokers report a shortage of material, particularly for shipment to eastern Pennsylvania users, who normally receive a considerable part of the New York and New England production of scrap. It is pointed out that for some time material has been moving by barge from New York to Buffalo and that the few New England users, such as plants at Bridgeport, Conn., and Worcester, Mass., have been steady buyers lately. In addition, the export movement of heavy melting steel has been good, with shipments of fair tonnages to Japan and Germany. At present German buyers are offering \$12, f.a.s. New York, and Japanese buyers, \$12.50 per ton, f.a.s. Boston or New York. Brokers shipping heavy melting steel to eastern Pennsylvania are paying \$11 to \$11.50 per ton, New York, or \$14.75 to \$15.25 per ton, delivered. As much as \$12.50 per ton delivered is being paid for yard steel and stove plate and \$16.50 to \$16.75 per ton for heavy breakable cast. Locomotive grate bars are bringing \$9.75 per ton, New York, for delivery to a consumer with a \$2.65 freight rate. A large eastern Pennsylvania consumer of strictly No. 1 steel is reported to have just closed on several thousand tons at \$16 per ton, delivered.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel.	\$11.00 to \$11.50
Heavy melting steel (yard)	7.75 to 8.75
No. 1 hvy. breakable cast.	12.50 to 13.00
Stove plate (steel works)	8.75
Locomotive grate bars....	8.75 to 9.25
Machine shop turnings....	7.00 to 7.50
Short shoveling turnings..	7.00 to 7.50
Cast borings (blast furn. or steel works).....	6.50 to 7.50
Mixed borings and turnings	6.00 to 6.50
Steel car axles.....	17.25 to 18.25
Iron car axles.....	24.75 to 25.75
Iron and steel pipe (1 in. dia., not under 2 ft. long)	10.75
Forge fire	7.25 to 7.75
No. 1 railroad wrought...	10.50 to 11.00
No. 1 yard wrot, long....	8.50 to 9.00
Rails for rolling.....	11.00 to 11.50
Cast iron carwheels.....	13.00 to 13.50
Stove plate (foundry)....	9.00 to 9.50
Malleable cast (railroad)...	10.00
Cast borings (chemical)...	11.25

Prices per gross ton, deliv'd local foundries:

No. 1 machy. cast.....	\$16.50
No. 1 hvy. cast (columns, bldg. materials, etc.)	
cupola size	14.50
No. 2 cast (radiators, cast boilers, etc.)	14.00

The creditors' committee of the Boston Structural Steel Co., 240 Albany Street, Cambridge, Mass., which has been supervising the business of the company for the past four years, has announced that the company is again on a sound financial basis, and the committee has been dissolved. The company's financial affairs became acute in July, 1924. William P. Shine is president and treasurer.

Cleveland

Specifications Still Heavy Against Third Quarter Steel Contracts—Buyers Hesitating As to Next Quarter

CLEVELAND, Sept. 18.—Specifications against contracts for steel bars, structural material and plates continue fairly heavy, these coming largely from customers whose third quarter contracts did not set Sept. 10 as the deadline for sending in specifications. Some of the mills have informed their customers that if they cannot make shipments on these late orders before Oct. 1 deliveries will be made at the mills' convenience. Considerable spot business is also coming out.

While some fourth quarter contracts have been taken at an advance of \$2 a ton over third quarter prices, many consumers are as yet showing a hesitancy about making fourth quarter commitments, and this attitude is evidently the cause of the increase in current orders.

A good volume of business is coming from the automotive industry, but mostly for early needs, as automobile manufacturers are awaiting a test of the new prices before contracting for extended deliveries. Reports from Detroit indicate that some of the automobile companies will curtail production or shut down for repairs around Nov. 1, which would indicate some falling off in steel requirements from that source in the next few weeks. A number of the larger consumers of alloy steel bars in the automotive field have covered for their last quarter's requirements and some concessions from the recently advanced prices are reported.

Current orders for steel bars, plates and structural material are being taken at 1.90c., Pittsburgh, although plates are still available at 1.85c. for deliveries through the fourth quarter. Steel bars are quoted at 1.90c. to 2c., Pittsburgh, and 1.95c. to 2.05c., Cleveland. A local mill is on a 1.90c., Cleveland, base for current orders, but has not yet openly named a fourth quarter price.

Structural lettings during the week included 4500 tons for a factory building for the Goodyear Tire & Rubber Co., Akron.

Pig Iron.—The market continues fairly active, although the volume of sales has shown a rather steady decline for two weeks. Lake furnace prices have again advanced 50c. a ton and the market has a very firm tone. Local furnaces are now quoting foundry and malleable iron at \$17.50, furnace, for outside shipment; another Lake furnace interest is quoting \$18, at which some business has been taken. Detroit furnaces have marked up their price to \$18.50 and another producer is showing a tendency toward that price in the Michigan territory, although \$18 has not disappeared. The price for Cleveland delivery is unchanged at \$18, or at the advance reported a week ago. Furnaces in the Valley district are now asking \$17 for basic iron. Most of the large consumers of foundry and malleable grades are covered for the remainder of the year. Many of the smaller foundries need additional iron and considerable hand-to-mouth buying in lots of 100 tons or under developed during the week. A Valley consumer bought a small lot of low

phosphorus iron at \$26.50. Shipping orders continue good and there are no indications of a lessening in the heavy demands from the automotive industry.

Prices per gross ton at Cleveland:

N'th'n fdy., sil. 1.75 to 2.25	\$18.50
S'th'n fdy., sil. 1.75 to 2.25	22.25
Malleable	18.50
Ohio silvery, 8 per cent....	28.00
Basic Valley furnace.....	\$16.50 to 17.00
Stand. low phos., V'ley fur.	26.50 to 27.00

Prices, except on basic and low phosphorus, are delivered Cleveland. Freight rates: 50c. from local furnaces; \$3 from Jackson, Ohio; \$6 from Birmingham.

Semi-Finished Steel.—Consumers are still showing hesitation in placing fourth quarter contracts for sheet bars, billets and slabs, for which a local mill is asking \$33, Cleveland; consequently that price has not yet been established. Specifications continue heavy.

Sheets.—Some business for October shipment has been taken at the regular quotations, but not enough to test prices. Barrel makers and some other manufacturers of standard products have specified heavily to take advantage of the present cash discount, but contract stamping plants do not find it practical to take in large stocks. Black sheets have a firm tone, with some current sales being made at 2.75c., Pittsburgh. Blue annealed sheets are still available at 1.90c., Pittsburgh. The galvanized sheet market still lacks firmness. Considerable business is coming out in auto body sheets, which have not been advanced for the last quarter.

Strip Steel.—Most consumers of 12 in. and narrower hot-rolled strip have covered for the last quarter at third

Warehouse Prices, f.o.b. Cleveland

	Base per Lb.
Plates and struct. shapes.....	3.00c.
Soft steel bars	3.00c.

No. 9 ann'l'd wire, per 100 lb.....	\$2.85
No. 9 gal. wire, per 100 lb.....	3.30
Com. wire nails, base per keg.....	2.85

*Net base, including boxing and cutting to length.

quarter prices. Specifications are fair. Some of the makers are using a 2c. blue annealed base in quoting for the fourth quarter on wide strip rolled on continuous mills, but no contracts are reported. Consumers of cold-rolled strip show a hesitancy about contracting for the fourth quarter. Mills are asking 2.75c., Cleveland, for round lots for that delivery, but this price has not been well tested. The demand for cold-rolled strip is being affected by the increased use by automobile manufacturers of one piece fenders requiring full finished sheets instead of fender stock.

Wire Products.—Considerable price irregularity on nails still exists in Detroit and other highly competitive markets, but leading producers are holding firmly to the regular \$2.55 per keg base. While wire is firmer than recently, some buyers have low-priced contracts that will carry them well through the fourth quarter.

Warehouse Business.—Sheets are moving well, but the demand for other products is only fair. Reinforcing bars are irregular and attempts are being made to get these on a higher base. Cleveland jobbers will probably adopt the new one-half of 1 per cent discount, although a definite decision has not yet been reached.

Fluorspar.—With a curtailment in production due to shutting down of some of the mines, the supply apparently is not in excess of the demand and the market has a firm tone. Gravel fluorspar is still available in small lots at \$17, mines. However, one producer has virtually withdrawn from the market by making a \$1 a ton advance.

Bolts, Nuts and Rivets.—Bolt and nut manufacturers have closed quite a few contracts since their announcement of the reestablishment for the fourth quarter of the present discount of 70 per cent off list. Rivet manufacturers, as expected, have reestablished the present base of \$2.90, Pittsburgh and Cleveland, and \$3, Chicago, for large rivets and 70 and 10 per cent off list for small rivets. Bolt and nut business is fair. Consumers are carrying small stocks and insist on prompt deliveries. The industry is operating at about 60 per cent of capacity.

Coke.—The demand for foundry coke continues good in specifications against contracts, but there is not much new business. Prices are unchanged at \$3.50 to \$4.85, ovens, for standard Connellsville brands and \$7.75, Painesville, for Ohio by-product coke. By-product domestic coke is moving well at \$4.50, Ohio ovens, and \$6, delivered Cleveland, for egg size.

Iron Ore.—The market has shown some activity recently in small-lot purchases by consumers who are rounding out their requirements for the winter season, several sales having been made in lots up to 10,000 tons. Shipments are holding up to the recent rate, and indications are that the movement for the season will be slightly more than that last year,

when Lake shipments were slightly over 51,000,000 tons.

The consumption of Lake ore during August amounted to 4,760,974 tons, a gain of 128,067 tons over that of July. The amount used in August last year was 4,368,101 tons. Furnace stocks on Sept. 1 amounted to 26,035,697 tons. The amount at furnaces and on Lake Erie docks on that date was 31,754,179 tons, compared with 35,802,565 tons on the same date a year ago. There were 155 furnaces using Lake ore in blast Aug. 31, a decrease of three for the month.

Old Material.—The tenseness that featured the market a week ago is less in evidence, as dealers who had short orders have made purchases in sufficient volume to relieve them somewhat of anxiety over obtaining supplies. Some buying was done by dealers during the week at the quoted prices and as high as \$14.75 was paid for selected heavy melting steel for delivery to a local mill. Further price advances were made on compressed sheet steel, No. 2 heavy melting steel, machine shop turnings and No. 2 railroad wrought. Blast furnace scrap is holding at recent quotations. No buying is being done by mills in this territory.

Prices per gross ton delivered consumers' yards:

Basic Open-Hearth Grades		
No. 1 heavy melting steel.	\$13.50 to	\$14.00
No. 2 heavy melting steel.	13.00 to	13.50
Compressed sheet steel....	13.00 to	13.50
Light bundled sheet stamp'gs	11.50 to	11.75
Drop forge flashings.....	11.50 to	12.00
Machine shop turnings....	8.50 to	9.00
No. 1 railroad wrought....	11.50 to	12.00
No. 2 railroad wrought....	13.50 to	14.00
No. 1 busheling	10.50 to	11.00
Pipes and flues	9.00 to	9.50
Steel axle turnings.....	12.50 to	13.00
Acid Open-Hearth Grades		
Low phos. forging crops...	16.00 to	16.50
Low phos., billet, bloom and slab crops	17.00 to	17.50
Low phos. sheet bar crops.	16.50 to	17.00

Miscellaneous		
Railroad malleable	15.00 to	15.50
Rails for rolling	16.25 to	16.50

Combination of *Automobile Trade Journal* and *Motor Age* into a single monthly publication devoted to the interests of the automotive trade has been announced by the Chilton Class Journal Co., Philadelphia. The new publication will be called *Automobile Trade Journal—including Motor Age* and the first issue will be in December.

The administrative board of the American Engineering Council will hold its next meeting in Pittsburgh, Oct. 19 and 20, under the auspices of the Engineers' Society of Western Pennsylvania.

Railroad Equipment

Illinois Traction System Buys 200 Cars

PURCHASE of 100 box and 100 gondola cars by the Illinois Traction System was the only recent feature of this market. Details of the week's business follow:

Illinois Traction System has ordered 100 40-ton box cars from Mount Vernon Car Mfg. Co. and 100 50-ton gondola cars from American Car & Foundry Co.

Northwestern Pacific is in the market for five motor coaches and five trailers. High Point-Thomasville & Denton will purchase 50 all-steel box cars.

Bangor & Aroostook has ordered two baggage-mail cars from Standard Steel Car Co.

Detroit Scrap Market Strong

DETROIT, Sept. 18.—Pig iron shipments are heavy in the district and about on a level with those of August, which was the high month for the year. Producers serving the district are quoting \$18.50, furnace, for No. 2 iron with usual differentials for fourth quarter delivery.

The market on old material continues strong. Sales are being made at a high range of prices. Despite the large production of automobiles and the correspondingly large production of scrap, offerings are being absorbed by dealers and mills at present prices.

Dealers' buying prices per gross ton f.o.b. cars, Detroit:

Hvy. melting and shov. steel	\$12.00 to	\$12.50
Borings and short turnings	8.00 to	8.50
Long turnings	7.00 to	7.50
No. 1 machinery cast....	14.00 to	15.00
Automobile cast	19.00 to	20.50
Hydraul. comp. sheets....	11.50 to	12.00
Stove plate	11.00 to	12.00
No. 1 busheling.....	9.50 to	10.00
Sheet clippings	7.50 to	8.00
Flashings	10.00 to	10.50

Production of pig iron in Italy during the first six months of 1928 totaled 204,500 metric tons as against 281,500 tons in the corresponding period of 1927 and 260,000 the first half of 1926. Crude steel output in Italy, however, increased to 892,000 tons in the first half of the present year as against 868,000 tons during the corresponding period of last year, according to the Iron and Steel Division, Department of Commerce. For the first half of 1926 Italian crude steel production was 895,000 tons.

Purchases of American agricultural machinery by Germany doubled the first six months of 1928 to 2796 metric tons as compared with 1219 tons the first half of 1927, according to the Agricultural Implements Division, Department of Commerce. Germany's total imports of agricultural machinery rose in the same proportion, from 3921 tons to 6652 tons. Values, however, rose less sharply, from 7,403,000 to 9,877,000 marks.

St. Louis

Pig Iron Advanced 50c. a Ton—Steel Sales Increase— Higher Prices Paid for Scrap by Dealers

ST. LOUIS, Sept. 18.—Announcement of an immediate advance of 50c. a ton on pig iron was sent to the trade last Friday by the St. Louis Gas & Coke Corporation, making its price \$19.50 to \$20, f.o.b. Granite City. The advance applied to all territories. Shipments by this maker have been heavier during the last week than in any week this year, and it has at the same time accumulated a good backlog of orders. Requests for shipments against contracts have been coming in strong, and the demand for spot iron is unusually heavy. The Granite City maker sold about 2000 tons during the week, including 1000 tons of foundry iron to an implement maker, 300 tons to a jobbing foundry in Iowa, and 200 tons each to two northern Illinois melters. Sales of Southern iron were small.

Prices per gross ton at St. Louis:
No. 2 fdy., sil. 1.75 to 2.25, f.o.b.
Granite City, Ill. \$19.50 to \$20.00
N'th'n No. 2 fdy., deliv'd St. Louis. 20.16
Southern No. 2 fdy., deliv'd. 20.67
Northern malleable, deliv'd. 20.16
Northern basic, deliv'd. 20.16

Freight rates: 81c. Granite City to St. Louis; \$2.16 from Chicago; \$4.42 from Birmingham.

Coke.—Dealers are showing increasing interest in their requirements of domestic grades of coke, but the demand for foundry grades in the district is still slow. Prices are unchanged.

Finished Iron and Steel.—The Granite City Steel Co. reports larger sales in the first 12 days of September than during a similar period in July and August, with the demand coming from diversified sources. Some improvement is noticed in specifications from jobbers. Many buyers are agreed that the demand for sheets will continue to grow during the next few months. Plates are not as active as sheets, but are showing an improvement. The advance in price on struc-

tural shapes, effective last Saturday, stimulated some buying by fabricators, but others lacked confidence in the reality of the advance and are delaying purchases pending a revival of construction activity. Warehouse business is fair; several of the larger oil producers bought much-needed supplies during the week.

Old Material.—Heavy melting steel, heavy shoveling steel, miscellaneous standard-section rails and No. 2 railroad wrought are 25c. a ton higher, while iron car axles and No. 1 railroad wrought are \$1 higher. The old material market is generally stronger, due to the activities of dealers, who are largely influenced by stronger markets elsewhere. Consumers in the district are buying very little. Railroad lists include: Southern Railway, 6000 tons; Gulf Coast Lines, 500 tons; Louisville & Nashville, 12,485 tons; Chesapeake & Ohio, 7895 tons; Atchi-

son, Topeka & Santa Fe, 6720 tons; Chicago & Alton, 1670 tons; Wabash, 1250 tons; Chicago, Rock Island & Pacific, 115 carloads; Nickel Plate, 25 carloads.

Dealers' buying prices, per gross ton, f.o.b. St. Louis district:

Heavy melting steel.....	\$11.75 to \$12.25
No. 1 locomotive tires....	12.50 to 13.00
Heavy shoveling steel.....	11.75 to 12.25
Miscel. stand.-sec. rails includ'g frogs, sw'ches and guards, cut apart..	13.25 to 13.75
Railroad springs.....	14.25 to 14.75
Bundled sheets.....	8.25 to 8.75
No. 2 railroad wrought...	11.75 to 12.25
No. 1 busheling.....	9.00 to 9.50
Cast iron borings.....	8.25 to 8.75
Iron rails.....	13.00 to 13.50
Rails for rolling.....	14.00 to 14.50
Machine shop turnings....	7.50 to 8.00
Steel car axles.....	18.00 to 18.50
Iron car axles.....	26.00 to 26.50
Wrot. iron bars and trans.	18.25 to 18.75
No. 1 railroad wrought...	10.75 to 11.25
Steel rails, less than 3 ft..	15.50 to 16.00
Steel angle bars.....	13.50 to 14.00
Cast iron carwheels.....	13.00 to 13.50
No. 1 machinery cast.....	13.50 to 14.00
Railroad malleable.....	11.75 to 12.25
No. 1 railroad cast.....	13.00 to 13.50
Stove plate.....	11.00 to 11.50
Agricult. malleable.....	11.50 to 12.00
Relay. rails, 60 lb. and under.....	20.50 to 23.50
Relay. rails, 70 lb. and over.....	26.50 to 29.00

Boston

Activity Shifting from Pig Iron to Old Material and Prices for Latter Are Higher

BOSTON, Sept. 18.—Activity in the local market is shifting from pig iron to scrap. Current buying of the former is mostly by small consumers, sales for the past week dropping to about 3500 tons, of which the Mystic Iron Works took at least half. Not much improvement in pig iron sales is anticipated until first quarter buying starts, but that is likely to come before the close of September. In fact, one or two important consumers are sounding out furnaces. Prices are firm on a basis of \$17, base Buffalo, or higher, there being no attractive tonnages in the market to induce concessions. Indian iron was sold in the past week at \$21.50 to \$22 a ton, on dock here, duty paid, and some Dutch also was disposed of. Little foreign iron is coming into New England, however, and prices on domestic iron will have to rise at least \$3 a ton to increase importations perceptibly.

Foundry iron prices per gross ton deliv'd to most New England points:

*Buffalo, sil. 1.75 to 2.25..	\$21.91
*Buffalo, sil. 2.25 to 2.75..	\$21.91 to 22.41
†Buffalo, sil. 1.75 to 2.25..	20.78
†Buffalo, sil. 2.25 to 2.75..	20.78 to 21.28
East. Penn., sil. 1.75 to 2.25	23.65
East. Penn., sil. 2.25 to 2.75	24.15
Va., sil. 1.75 to 2.25.....	25.71
Va., sil. 2.25 to 2.75.....	26.21
Ala., sil. 1.75 to 2.25.....	23.16 to 25.02
Ala., sil. 2.25 to 2.75.....	23.66 to 25.52

Freight rates: \$4.91 all rail and \$3.78 rail and water from Buffalo; \$3.65 from eastern Pennsylvania; \$5.21 all rail from Virginia; \$6.91 to \$8.77 from Alabama.
*All rail rate. †Rail and water rate.

Coke.—New England ovens are behind on shipments of foundry coke, although not as much so as a week

ago. There is a slight increase in the New England melt of iron, which, together with the stocking of coke by many foundries, accounts for the inability of ovens to keep up with specifications. Foundry coke is still \$11 a ton, delivered within a \$3.10 freight rate zone. Demand for domestic coke is gaining.

Bars.—Reinforcing bars have been advanced \$2 a ton to 2c. a lb., base

Pittsburgh. Direct mill shipments are now 2.36½c. per lb., delivered common Boston freight rate points, while 2.61½c. is the Boston warehouse base. Local distributors are adhering to the full asking price in most cases. Local mill representatives have comparatively little fourth quarter business on their books, consumers preferring to buy only as stock is needed.

Old Material.—The movement of old material out of New England into the Pittsburgh territory continues to increase in volume, a further advance in prices bringing out scrap freely and thereby making it easier for brokers to fill orders. Eastern Pennsylvania mills are not yet much of a factor in the local scrap market, but the trade expects they will be shortly. Exporters are beginning to show interest in No. 1 automobile scrap at \$9.50 to \$9.75 a ton, delivered on dock at Boston. New England foundries continue to buy textile and No. 1 machinery cast from nearby yards. Brokers are shipping quite a little No.

1 machinery cast into the Pittsburgh district, and are paying 50c. a ton more than they did a week or 10 days ago. The greatest demand is for heavy melting steel, rails, skeleton and forge flashings, although material of every description is moving.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel.....	\$10.50 to \$10.75
Scrap T rails.....	10.00 to 10.50
Scrap girder rails.....	9.50 to 10.00
No. 1 railroad wrought....	9.00 to 9.50
No. 1 yard wrought.....	8.00 to 8.50
Machine shop turnings....	6.00 to 6.50
Cast iron borings (steel works and rolling mill)...	6.00 to 6.50
Bundled skeleton, long....	8.00 to 8.50
Forge flashings.....	8.50 to 9.00
Blast furnace borings and turnings.....	6.00 to 6.50
Forge scrap.....	6.00 to 6.50
Shafting.....	14.00 to 14.50
Steel car axles.....	15.50 to 16.00
Wrought pipe 1 in. in diameter (over 2 ft. long).....	9.00 to 9.50
Rails for rolling.....	9.50 to 10.00
Cast iron borings, chemical.....	9.50 to 10.00

Prices per gross ton deliv'd consumers' yards:

Textile cast.....	\$14.00 to \$14.50
No. 1 machinery cast.....	15.50 to 16.00
No. 2 machinery cast.....	13.50 to 14.00
Stove plate.....	10.00 to 10.50
Railroad malleable.....	15.00 to 15.50

been shown by buyers throughout Ontario and Quebec. Montreal dealers report a strong demand for most grades, both for domestic consumption and for export. Some dealers are offering 50c. to \$1 a ton above the usual market to secure desired lots.

Dealers' buying prices:

	<i>Per Gross Ton</i>

Canada

Rail and Structural Steel Orders Lead in Dominion Market —Pig Iron and Scrap Stronger

TORONTO, ONT., Sept. 18.—The Algoma Steel Corporation, Sault Ste. Marie, Ont., has closed two orders for rails, one for 15,000 tons of 100-lb. now being rolled, and one for 15,000 tons of 85-lb. The Soo rail mill has been in continual operation since the first of the year. The rail mill at Sydney, N. S., has orders on hand for about 20,000 tons.

Pig Iron.—The increased demand which set in a week or 10 days ago continues to feature business in the Canadian markets. The possibility of a price advance has brought melters into the market for last quarter iron. Contracts for lots ranging from 1500 to 2000 tons for delivery to the end of the year have been appearing in good numbers, with the result that more than 60 per cent of the consumers are now covered. Spot sales up to 500 or 600 tons have been made. Local blast furnace representatives are trying to do away with the spread in quotations, and in this connection are quoting a straight price of \$23.60 for foundry and malleable iron, delivered Toronto, while Montreal salesmen are now quoting these grades at \$25, delivered Montreal. Prices in the Canadian markets are strong.

Structural Steel.—While the demand for structural steel continues to hold a leading place in the business of the iron and steel industry of this country, sales for the week showed a slight decline from those of previous weeks. The amount of prospective business, however, is large. Reid & Brown, Ltd., Toronto, Ont., has the contract for 1500 tons of steel for a factory at Mount Dennis, Ont., for Firstbrook Boxes, Ltd.; the Dominion Bridge Co., Ottawa, has been awarded 1000 tons for the Medical Arts Building, Ottawa. Several contracts ranging from 200 to 500 tons were also awarded. For the proposed Hennepin Hotel at Niagara Falls, Ont., 3500 tons of structural steel will be required; 1500 tons of structural and 350 tons of reinforcing bars will be bought for a garage in Montreal, for Zetland Garages, Ltd.; for an office building at University Avenue and Elm Street, Toronto, for the National Life Assurance Co. of Canada, 1200 tons of steel will be needed. The Canada Life Assurance Co. of Canada, Ltd., is completing arrangements for the erection of a large office building in Toronto which will take 8000 and 10,000 tons of steel.

Old Material.—With general business conditions in the iron and steel industry of Canada steadily improving, old material sales have fallen in line. The demand for practically all grades of scrap has gained within the past two or three weeks. Much of the improvement is due to liberal buying of heavy melting steel, turnings and rails by consumers in the Hamilton, Ont., district, but interest has also

Youngstown

Valley Steel Plant Operations Average 85 Per Cent

YOUNGSTOWN, Sept. 18.—Improved conditions in the iron and steel trade of northeastern Ohio are holding, as evidenced by high operating rates. Sheet and strip makers are booked from four to six weeks ahead, and longer in some cases. Producers of full finished sheets are sold up well into November. The automotive industry of Michigan is the bright spot in sheet steel demand.

The Youngstown Sheet & Tube Co. has advanced basic pig iron at Chicago to \$18.50. The company is the largest merchant producer and seller in the Chicago area. At Youngstown, the company is quoting basic and No. 2 foundry iron at \$17 and malleable at \$17.50. In establishing a differential of 50c. a ton between foundry and malleable, the company is following the practice of Buffalo melters. A higher grade of iron ore is required for malleable iron.

The Sheet & Tube company is operating its seamless tube mills on day and night shifts, and this department is on a better basis now than at any time since its installation.

Of 53 independent open-hearth furnaces, 47 are scheduled this week. Two of the 53 units have never been operated. Bessemer steel plants are operating at a somewhat lower rate, bringing the average of steel plant production in the district to 85 per cent.

The Ohio State Foundrymen's Association, with headquarters in Cleveland, has changed its name to Ohio Foundries Association, Inc., having been incorporated under the new name. The association felt that a name should be chosen that would be more distinctive of the association's real status, as it is an organization of foundries rather than of individuals, as the old name might indicate.

Prices per gross ton:

Birmingham

Steel Backlogs Increasing—Pig Iron Demand Steady— 16,000 Tons in Dallas Cast Iron Pipe Project

BIRMINGHAM, Sept. 18.—Day to day business in the pig iron market is at a fair rate. Some customers are covering through the year but a considerable portion of the fourth quarter tonnage is yet to be booked. Small-lot sales predominate. Occasional orders are being booked from outside the district. Shipments are going forward at about the same rate as in August, which was one of the best months of the year. Prices are steady at \$16.25 for No. 2 foundry. The Tennessee company changed Nos. 1, 3 and 4 at Ensley from foundry to basic on Sept. 10. The rebuilt furnace of the Gulf States Steel Co. at Alabama City was placed in operation on basic iron Sept. 17. It has a capacity of about 400 tons. Of the 18 furnaces now active, 10 are on foundry, six on basic, one on recarburizing iron and one on ferromanganese.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil.....	\$16.25
No. 1 fdy., 2.25 to 2.75 sil.....	16.75
Basic	16.25

Finished Steel.—Backlogs have been further enlarged this month. Rail orders are slow in developing, but all other lines are active. One company has practically all finishing mills on double shift. Quotations are unchanged, and preferential prices are less frequently made than at any time this year. Structural steel inquiries are good but lettings are small. Bar manufacturers have booked a good aggregate of small orders, and a better outlook is reported. The open-hearth activity of the Tennessee company has been increased to 12 furnaces by the resumption of operations

of six at Ensley. The Gulf States Steel Co. is now operating four, a gain of one.

Cast Iron Pipe.—Bids are being submitted on a project at Dallas, Tex., requiring 16,000 tons of 30 to 36-in. pipe. This is the largest tonnage to develop in recent weeks. Decision is pending as to whether cast iron or steel pipe will be used. The National Cast Iron Pipe Co. has secured an order for 1000 tons for St. Louis. Stocks on yards are light and shipments are taking care of current production. Prices are firm at \$34 to \$35 on 6-in. and larger sizes.

Coke.—The demand for both foundry and domestic coke has improved, and current output is being largely taken. Some business has been booked through the first quarter of next year. Shipments show a little gain. Quotations remain at \$5 for both spot and foundry coke.

Old Material.—Some activity is shown in all lines, and the market as a whole is much stronger than it was 30 days ago. No. 1 cast and heavy melting steel are in greatest demand. Dealers' stocks are being gradually reduced. No further price changes have been made.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel.....	\$10.00 to \$11.00
Scrap steel rails.....	11.50 to 12.00
Short shoveling turnings..	8.00 to 8.50
Cast iron borings.....	8.00
Stove plate	13.50
Steel axles	19.00 to 20.00
Iron axles	21.00 to 22.00
No. 1 railroad wrought...	10.00 to 10.50
Rails for rolling.....	14.00
No. 1 cast	15.00
Tramcar wheels.....	13.00 to 14.00
Cast iron carwheels.....	13.00 to 13.50
Cast iron borings, chem...	13.50 to 14.00

Buffalo

Pig Iron Advanced 50¢ a Ton for First Quarter—Steel Mills Active—Scrap Prices Higher

BUFFALO, Sept. 18.—Local furnaces are asking an advance of 50c. a ton on first quarter pig iron business. The ruling price in the district for No. 2 plain, 1.75 to 2.25 silicon, for first quarter is \$18 and for last quarter \$17.50. One furnace is asking \$18 for last quarter iron in the district and \$17.50 for outside shipment. Most of the furnaces are making a price of \$17 for last quarter delivery in the East and \$17.50 for first quarter. Sales have been so heavy that some of the furnaces are a little short of iron. Two inquiries are out for 1000 tons each. One is for foundry and another for various grades of malleable, both from the East. An order for 2000 tons of No. 3 iron was placed by an Eastern melter. Other sales were 400 tons of malleable and 250 tons of

foundry. The Worthington Pump & Machinery Corporation is in the market for 1500 tons of malleable and foundry iron.

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil. 1.75 to 2.25.....	\$17.00 to \$18.00
No. 2X fdy., sil. 2.25 to 2.75.....	17.50 to 18.50
No. 1X fdy., sil. 2.75 to 3.25.....	18.50 to 19.50

Com. wire nails, base per keg....	\$3.65
Black wire, base per 100 lb.....	3.90

Finished Iron and Steel.—Operations at the Lackawanna, Donner, Wickwire-Spencer and Seneca mills are approximately at 90 per cent or better, and inquiry for the steel they roll is voluminous enough to indicate a high rate of operation for some time. Prices are steady and specifications are excellent. Sheet business is especially good, and wire goods purchasing has been extensive. A new State Teachers' College at Buffalo will require 250 tons of reinforcing bars. Structural steel fabricators report quite a volume of smaller lots.

Old Material.—The market has strengthened through renewed purchasing of small lots. One of the largest consumers has been forced to pay \$15.50 for No. 1 heavy melting steel and there have been other transactions at \$15.75 and \$16. No. 1 busheling has been sold at \$14.50. A large consumer whose last purchase of No. 1 heavy melting steel was at \$13.75 has since remained out of the market. It is understood that a sale of No. 2 steel was made at \$13. There has been some selling of No. 1 machinery cast scrap at \$15.50 and in one instance at \$16. There were also some transactions in shoveling turnings.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades

No. 1 heavy melting steel.....	\$15.25 to \$15.75
No. 2 heavy melting steel.....	13.00

An exhibition of American ceramic products has been arranged by the American Ceramic Society in connection with its thirty-first annual convention, Feb. 4 to 9, 1929, in Chicago. The exhibition, to be known as the American Ceramic Exposition, will be held in the exhibition hall of the Stevens Hotel, the society's headquarters.

San Francisco

Oil Storage Tanks Call for 11,000 Tons of Plates—Cast Iron Pipe Awards of 2900 Tons

SAN FRANCISCO, Sept. 15 (*By Air Mail*).—An award of 4250 tons of plates for a pipe line at Dallas, Tex., and 1490 tons of cast iron pipe for the same city, together with inquiries for a number of oil storage tanks, requiring over 11,000 tons of plates, were the outstanding developments on the Pacific Coast this week. In addition, a fair tonnage of structural steel shapes was placed and new inquiries appear to be on the increase.

Pig Iron.—Buying is confined to immediate needs. Prices are unchanged.

Prices per gross ton at San Francisco:

*Utah basic		\$25.00 to \$26.00
*Utah fdy., sil. 2.75 to 3.25		25.00 to 26.00
**Indian fdy., sil. 2.75 to 3.25		24.00 to 25.00

*Delivered San Francisco.
**Duty paid, f.o.b. cars San Francisco.

Bars.—Reinforcing steel bar awards this week, the heaviest in over six weeks, totaled nearly 2100 tons. An office building and an apartment in Los Angeles each required 500 tons. The Pacific Coast Steel Co. secured 200 tons for a school in San Francisco. The majority of lettings involved lots ranging from 30 to 40 tons. Bids have been opened on 1800 tons for the Lide Science Building at Berkeley and bids will be opened Nov. 14 on the San Gabriel dam, Los Angeles, involving 350 tons. Out-of-stock prices in Los Angeles and San Francisco continue at 1.80c., base, but on some orders less has been accepted.

Plates.—Due to renewed activity in some of the oil fields in the southern part of the State, demand for oil tankage has increased in a large way. In addition to 1500 tons for five 80,000 bbl. tanks for the Shell Oil Co. at Martinez, Cal., bids on which have been opened, this company has issued an inquiry for 10 80,000 bbl. tanks, taking 3200 tons, for its Domingues refinery plant. The General Petroleum Corporation, Los Angeles, is asking for bids on 14 82,000 bbl., 120-ft. diameter tanks, which will require about 5000 tons. The Rio Grande & Barnsdall Oil Co., Santa Barbara, has an inquiry out for two 80,000 bbl. tanks, calling for 620 tons. Bids will be opened Nov. 14 on the San Gabriel dam, Los Angeles, involving 1135 tons of 60-in. discharge pipe. The Uvalde

Construction Co., Dallas, secured the general contract for 4250 tons of 30 and 36-in. welded steel pipe for the city, the fabrication to be done by an unnamed interest. Plate prices appear to be generally 2.20c., but some business is still at 2.25c. and occasionally as high as 2.30c., c.i.f. Coast ports.

Shapes.—Lettings of structural shapes totaled 650 tons this week, the largest of which was 220 tons for the City Hall at Glendale, Cal., placed with the Llewellyn Iron Works. McClintic-Marshall Co. took 150 tons for a factory on McKee Street, Los Angeles. Bids were opened this week on 230 tons for a bridge over the Kalama River in Washington and on 120 tons for a bridge over the Coweeman River in Washington. On Sept. 28 bids will be opened on 243 tons for the Gardiner bridge over the Yellowstone River in Montana. An election will be held in November to vote on bonds for the Fourteenth Avenue South bridge at Seattle involving 2800 tons. Plain material is firm at 2.35c., c.i.f.

Cast Iron Pipe.—Awards of cast iron pipe, at 2900 tons, were larger

than for any week since the latter part of June. The Central Foundry Co. secured 1490 tons of 16 to 24-in. Class 100 Universal pipe for Dallas, Tex. San Diego, Cal., placed 355 tons of 4 to 10-in. Class B for the improvement of the Encanto District with the Miracle Construction Co. The Monarch Construction Co., Aberdeen, Wash., took the general contract for 846 tons of 4 to 10-in. centrifugal pipe for Edmonds, Wash. Hall-Johnson Co., Alhambra, secured 133 tons of 4 and 6-in. Class B pipe for El Monte, Cal. The Blodell-Donovan Lumber Co., Bellingham, Wash., awarded 100 tons of 16-in. Universal pipe to the Central Foundry Co. The George Nelson Co., Seattle, was low on 949 tons of 8 to 30-in. Class C pipe for the Denny Hill improvement project for the city. Bids have been opened on 1467 tons of 4 to 12-in. Class B for Clearwater, Cal., and on 263 to 537 tons of 2 to 12-in. Class B for Phoenix, Ariz. The V. R. Dennis Construction Co. was low on 178 tons of 4 to 10-in. Class B for the improvement of Mt. View Drive, San Diego.

Steel Pipe.—An increase in demand for standard pipe is expected shortly, as stocks in warehouses are becoming depleted in many sizes. Oil country goods continue in good demand. No large pipe line inquiries are up for figures.

Cincinnati

Pig Iron Sales Total 15,000 Tons—Scrap Prices Again Advance—Sheet Buying Heavy

CINCINNATI, Sept. 18.—Pig iron sales have again turned upward and bookings in the past week totaled about 15,000 tons. More than half of this amount was for the Louisville, Ky., plant of the Standard Sanitary Mfg. Co. This transaction was notable in that it covered practically all of the remaining yard stocks of an Ironton, Ohio, furnace which has been idle for a number of months. It is understood that shipment will be made by water, in which case the barge rate plus a local switching charge at Louisville indicates that the seller realized less than \$17, base Ironton. The disposal of this round lot of foundry iron leaves only a small stock at Ironton belonging to another inactive producer. Thus, temporarily at least, Ironton is no longer a factor in the foundry iron market. The Standard Sanitary Mfg. Co. also purchased from 2000 to 3000 tons of Southern iron, paying \$16.25, Birmingham. A Tennessee furnace interest is quoting \$16.25, Birmingham, after a short period during which orders were taken at \$16. Northern Ohio sellers are reported to be asking a minimum of \$17, base furnace, and are trying to obtain 50c. a ton more in some cases. Open inquiries are scarce. However, most of the ton-

nage bought recently has been contracted for quietly.

Prices per gross ton, deliv'd Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25		\$18.89 to \$19.89
So. Ohio malleable		20.14 to 20.89
Ala. fdy., sil. 1.75 to 2.25		19.94
Ala. fdy., sil. 2.25 to 2.75		20.44
Tenn. fdy., sil. 1.75 to 2.25		19.94
So'th'n Ohio silvery 8 per cent		26.89

Freight rates, \$1.89 from Ironton and Jackson, Ohio; \$3.69 from Birmingham.

Finished Material.—District sheet mills have been booking liberal tonnages for late September and for Oc-

Seamless steel boiler tubes, 2-in.	 19.00
4-in.	 39.00

tober delivery. In fact, orders and specifications have exceeded production by a comfortable margin, so that backlogs of considerable proportions have accumulated. Operations continue at full capacity and no slackening in the rate of output is expected in the near future. The roofing demand in the South is fully up to normal, with the result that the call for galvanized sheets has been heavy. While low prices have ruled in recent weeks, there has been a stiffening tendency in the past few days and the minimum is now 3.65c., base Birmingham. Blue annealed stock is being sold at 2c., Pittsburgh, although a few small lots have brought 2.10c. Black sheets remain at 2.75c., Pittsburgh. Specifications for bars, shapes and plates have been fair.

Coke.—The coke market is fairly well stabilized, and present indications are that prices of by-product foundry coke will not be changed during the remainder of September and during October. There is a possibility that domestic grades may be advanced, but this is considered somewhat remote. A further increase in foundry coke specifications is noted and in this respect the month promises to be the best since last spring.

Old Material.—Heavy melting steel is up 75c. a ton, while scrap rails and short rails have each advanced \$1. Loose sheet clippings and bundled sheets also are showing strength, dealers having paid for these items 25c. a ton more than they did a week ago. Railroad lists which closed last week brought much higher prices than last month and it is understood that dealers are bidding for scrap at more than mills are willing to pay. The buoyant state of the market is reflected in the extensive buying by dealers and by heavy specifications from steel plants in this district.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel.....	\$12.50 to \$13.00
Scrap rails for melting.....	13.00 to 13.50
Loose sheet clippings.....	9.25 to 9.75
Bundled sheets.....	10.00 to 10.50
Cast iron borings.....	8.50 to 9.00
Machine shop turnings.....	8.00 to 8.50
No. 1 busheling.....	10.50 to 11.00
No. 2 busheling.....	6.00 to 6.50
Rails for rolling.....	13.00 to 13.50
No. 1 locomotive tires.....	13.00 to 13.25
No. 2 railroad wrought.....	12.50 to 13.00
Short rails.....	17.00 to 17.50
Cast iron carwheels.....	12.00 to 12.50
No. 1 machinery cast.....	16.00 to 16.50
No. 1 railroad cast.....	13.00 to 13.50
Burnt cast.....	8.00 to 8.50
Stove plate.....	9.25 to 9.75
Brake shoes.....	10.25 to 10.75
Railroad malleable.....	12.25 to 12.75
Agricultural malleable.....	11.25 to 11.75

The Brown Instrument Co., Philadelphia, is enlarging its heating plant, which will include a Brown resistance thermometer by means of which the operating engineer may learn, through a suitable switch, the temperature in any department without leaving the boiler room. An H. B. Smith sectional boiler will be used, oil fired in connection with a Brown recording liquid level gage, which will give the rate as well as the amount of oil consumption.

REINFORCING STEEL College Building Will Require 1800 Tons

INCLUDING a science building for the University of California at Berkeley, which will take 1800 tons, new projects brought out during the week totaled 4550 tons. The following awards total 4400 tons:

BOSTON, 500 tons, milk depot in Charlestown district, to Concrete Steel Co.
BOSTON, 175 tons, Boston Elevated Railroad extension in Dorchester district, to Truscon Steel Co.
WILMINGTON, DEL., 300 tons, Y. M. C. A. building, to Kalman Steel Co.
ERIE, PA., 500 tons, West High School, to Truscon Steel Co.
PITTSBURGH, 335 tons, municipal sewer job, to Carlem Engineering Co.
CHICAGO, 150 tons, garage for Swift & Co., to Barton Spiderweb System, Inc.
CHICAGO, 170 tons of rail steel bars, St. Joseph Orphanage, to Barton Spiderweb System, Inc.
ALEXANDRIA, LA., 500 tons, United States Veterans' Hospital, to Jones & Laughlin Steel Corporation.
TACOMA, WASH., 100 tons, Hooker Chemical Co. plant, to Northwest Steel Rolling Mills.
NYSSA, ORE., 338 tons, Owyhee Dam, to an unnamed company.
SAN FRANCISCO, 200 tons, St. Ignatius School, to Pacific Coast Steel Co.
LOS ANGELES, 500 tons, apartment building at Rosewood and Rossmore Avenues, to an unnamed firm.
LOS ANGELES, 165 tons, Verdugo storm drain, to Soule Steel Co.

LOS ANGELES, 500 tons, office building, Hollywood Boulevard and Vine Street, to an unnamed company.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

BOSTON, 250 tons, Boston & Maine Railroad baggage room.
NEW YORK, 100 tons, building for Mosaic Tile Co. at 443-5 West Forty-first Street; Frank S. Parker, architect.
BROOKLYN, 200 tons, factory building for I. Rokeach & Sons.
BUFFALO, 250 tons, State Teachers' College.
CHICAGO, 400 tons, building for John Sexton & Co.; Alfred S. Alschuler, architect.
ST. LOUIS, 300 tons, hotel at Twelfth Boulevard and Olive Street; Boaz-Kiel Construction Co., Ambassador Building, contractors.
FORT LEWIS, WASH., 500 tons, barracks and officers' quarters.
SEATTLE, 400 tons, addition to Olympic Hotel.
SALEM, ORE., 260 tons, Mill Creek bridge; general contract to Holdener Construction Co., Sacramento, Cal.
LOS ANGELES, 350 tons, San Gabriel Dam; bids Nov. 14.
OAKLAND, CAL., 248 tons, south spillway, East Bay Municipal Utility District; Ward Engineering Co., low bidder.
OAKLAND, 100 tons, Pardee reservoir, East Bay Municipal Utility District; Ward Engineering Co., low bidder.
BERKELEY, CAL., 1800 tons, Lide science building, University of California; bids opened.

New Trade Publications

Cars and Trailers.—Lakewood Engineering Co., Cleveland. Catalog 16-A of 56 pages illustrates and describes a wide variety of narrow-gage cars and track, trailers, trucks and skids. Specifications and dimensions are given, both of a great many types of cars and of some of the details used in their manufacture.

Direct-Current Motors.—Louis Allis Co., Milwaukee. Bulletin 507 of 12 pages illustrates and describes a line of small motors for a variety of uses, with both horizontal and vertical axes. Included are sectional views, pointing out the principal features.

Electric Drive.—Electric Machinery Mfg. Co., Minneapolis. Descriptive booklet of 56 pages and 85 illustrations, devoted to synchronous motors. Both theoretical and practical points are taken up, many of the illustrations being installation views. Details of construction and consideration of auxiliaries are given attention.

Belt Lacer.—Clipper Belt Lacer Co., Grand Rapids, Mich. Folder describing a new speed lacer, which is said to lace a 6-in. belt in 1½ min.

Gasoline Locomotives.—George D. Whitcomb Co., Rochelle, Ill. Bulletin 2822 of 12 pages illustrates and describes a line of gasoline locomotives from 2½ to 5 tons in weight. Specifications, hauling capacities on various grades and details of design are given considerable attention.

Resistance Thermometers.—Leeds & Northrup Co., Philadelphia. Catalog No. 80, illustrated with photographs and charts, has 30 pages of descriptions of resistance, temperature recording, automatic recording and other types of thermometers.

Water-Tube Boiler.—Erie City Iron Works, Erie, Pa. Eight-page bulletin illustrating and describing a three-drum water-tube boiler, with sections showing the design. Accompanying this is another eight-page bulletin giving representative applications of this type of boiler in industrial plants and showing sections of the units involved. Several of these are fired with powdered coal.

Bending Machines.—Wallace Supplies Mfg. Co., 1310 Diversey Parkway, Chicago. Bulletin 25, of 32 pages, illustrated, describes a line of bending machines for pipe, tube and bar stock up to 6-in. pipe size. Equipment is for both hand and power operation, depending largely on the size. There is a wide variety shown, for various specific purposes. Bar cutters, shears, punches and a variety of other equipment will be found in the bulletin.

Timing Drives.—Diamond Chain & Mfg. Co., Indianapolis. Illustrated folder of four pages in two colors describing a new type of timing drive with double-strand chain, weighing much less than the usual systems. Compactness and simplicity of construction are features stressed.

Non-Ferrous Metal Markets

Copper Prices Advanced, Tin Active and Higher, Lead Quotations Advanced, Zinc Quiet and Steady

Copper.—Convinced that the price of copper would not fall below 14.75c., delivered in the Connecticut Valley, and fearing an advance, domestic consumers for the past two weeks have been buying copper so heavily that it is estimated that at least 80,000 tons was sold up to Sept. 15, with the result that several producers withdrew from the market for October delivery. On Saturday, Sept. 15, despite the opposition of several producers, an advance in copper prices was suddenly announced. First came an increase in the quotation of Copper Exporters, Inc., from 15c. to 15.25c.,

	THE WEEK'S PRICES. CENTS PER POUND FOR EARLY DELIVERY					
	Sept. 18	Sept. 17	Sept. 16	Sept. 15	Sept. 13	Sept. 12
Lake copper, New York.....	15.00	15.00	15.00	14.75	14.75	14.75
Electrolytic copper, N. Y.*.....	14.75	14.75	14.75	14.50	14.50	14.50
Straits tin, spot, N. Y.	48.00	47.75		47.50	47.57½	47.45
Lead, New York.....	6.50	6.50	6.40	6.40	6.40	6.40
Lead, St. Louis.....	6.32½	6.30	6.25	6.25	6.25	6.25
Zinc, New York.....	6.60	6.60	6.60	6.60	6.60	6.60
Zinc, St. Louis.....	6.25	6.25	6.25	6.25	6.25	6.25

*Refinery quotation; delivered price ¼c. higher.

c.i.f. European ports, followed at once by an advance in the domestic electrolytic price to 15c., delivered in the Connecticut Valley. At 15c. electrolytic copper is at the highest level this year and 2½c. per lb. above the low level of last year in July. Not since early in January, 1925, has copper been sold at 15c. Since the advance on Sept. 15, buying has been heavy both by domestic and foreign consumers, particularly the latter. Foreign consumers still have considerable September and October metal to buy. It is estimated that 70 per cent of the November requirements of domestic consumers have been contracted for. Sales to foreign consumers are estimated at 45,000 tons for the first half of September. At the higher levels the market was quite active Monday and Tuesday, with foreign sales predominating today, Tuesday. Demand for Lake copper has in-

creased decidedly, with sales quite large and prices higher at 15c. to 15.12½c., delivered.

Tin.—At least 1200 tons of tin was sold during the week ended Saturday, Sept. 15, and the total may have been somewhat larger because a London house with New York connections was quietly selling considerable metal. Last week marks the fourth week of a very active market, with the total sales for those weeks amounting to about 6500 tons, one of the most active periods in many months. Sales last week were confined principally to consumers, with spot to December chiefly involved, although a little April-June metal was contracted for. Yesterday, Monday, about 300 tons was sold to consumers. Today, Tuesday, the market was very quiet, with spot Straits tin quoted at 48c., New York. London prices Tuesday were considerably higher than a week ago, with spot

Metals from New York Warehouse

Delivered Prices Per Lb.

Tin, Straits pig.....	49.50c. to 50.50c.
Tin, bars	51.50c. to 52.50c.
Copper, Lake	16.00c.
Copper, electrolytic.....	15.75c.
Copper, casting	15.00c.
Zinc, slab	7.25c. to 7.75c.
Lead, American pig.....	7.50c. to 8.00c.
Lead, bar	9.25c. to 10.25c.
Antimony, Asiatic	12.75c. to 13.25c.
Aluminum No. 1 ingots for remelting (guar'nt'd over 99% pure)	25.00c. to 26.00c.
Alum. ingots, No. 12 alloy	24.00c. to 25.00c.
Babbitt metal, commerc'l grade,	30.00c. to 40.00c.
Solder, ½ and ½	32.00c. to 33.00c.

Metals from Cleveland Warehouse

Delivered Prices Per Lb.

Tin, Straits pig.....	52.38c.
Tin, bar	56.38c.
Copper, Lake	14.85c.
Copper, electrolytic.....	14.85c.
Copper, casting	14.00c.
Zinc, slab	8.00c.
Lead, American pig.....	6.85c. to 7.10c.
Lead, bar	9.50c.
Antimony, Asiatic	16.00c.
Babbitt metal, medium grade.....	18.50c.
Babbitt metal, high grade.....	56.00c.
Solder, ½ and ½	31.25c.

Rolled Metals from New York or Cleveland Warehouse

Delivered Prices, Base Per Lb.

Sheets—	
High brass	19.50c.
Copper, hot rolled	24.25c.
Copper, cold rolled, 14 oz. and heavier	26.00c.
Seamless Tubes—	
Brass	24.37½c.
Copper	25.25c.
Brazed Brass Tubes.....	27.50c.
Brass Rods	17.25c.

From New York Warehouse

Delivered Prices, Base Per Lb.

Zinc sheets (No. 9),	10.00c. to 10.50c.
asks	11.00c. to 11.50c.
Zinc sheets, open,	11.00c. to 11.50c.

Non-Ferrous Rolled Products

Mill prices on all brass and copper products were advanced ¼c. on Sept. 17. Zinc sheets are still quoted at 9.75c. per lb., base, and lead full sheets at 10c. to 10.25c.

List Prices, Per Lb., f.o.b. Mill

On Copper and Brass Products, Freight up to 75c. per 100 Lb. Allowed on Shipments of 500 Lb. or Over

Sheets—	
High brass	19.50c.
Copper, hot rolled	23.75c.
Zinc	9.75c.
Lead (full sheets).....	10.00c. to 10.25c.

Seamless Tubes—

Brass Rods	17.25c.	
Brazed Brass Tubes.....	27.50c.	

standard quoted at £215, future standard at £212 7s. 6d. and spot Straits at £218 10s. The Singapore price today was £215 15s. Arrivals thus far this month have been 4395 tons, with 7185 tons reported afloat.

Lead.—On Monday, Sept. 17, the American Smelting & Refining Co. unexpectedly advanced its contract quotation from 6.40c. to 6.50c., New York. Prices in the outside market were also raised from 6.25c. to 6.30c. to 6.32½c., St. Louis. Monday and today, Tuesday, a very good business was reported, largely for October delivery, and the price in the West is higher at 6.32½c. to 6.35c.

Zinc.—Conditions are unchanged. Prime Western zinc is quoted at 6.25c., East St. Louis, or 6.60c., New York. Rumors of concessions from these levels are unverified. Sellers report the market as very quiet, with some business done each day. The ore situation is unchanged both as to stocks and price, which is still \$40, Joplin.

Antimony.—Consumers are showing more interest and Chinese metal is higher at 10.87½c. to 11c., New York,

duty paid, for spot delivery, with futures at 10.62½c.

Nickel.—Wholesale lots of ingot nickel are quoted at 35c. and shot nickel at 36c. and electrolytic nickel at 37c. per lb.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is quoted at 23.90c., per lb., delivered.

Non-Ferrous Metals at Chicago

CHICAGO, Sept. 18.—Prices for tin and lead are advanced in a strong market. Sales are far more numerous than a week ago. Prices for old metals are firmer and users are more interested in the market.

Prices, per lb., in carload lots: Lake copper, 15.25c.; tin, 49c.; lead, 6.40c.; zinc, 6.35c. in less-than-carload lots; antimony, 12c. On old metals we quote copper wire, crucible shapes and copper clips, 10.75c.; copper bottoms, 9.75c.; red brass, 9.50c.; yellow brass, 7.25c.; lead pipe, 4.75c.; zinc, 3.50c.; pewter, No. 1, 30c.; tin foil, 36.25c.; block tin, 45.25c.; aluminum, 12c., all being dealers' prices for less-than-carload lots.

Fabricated Structural Steel

New York Subway Takes 26,000 Tons of 49,000 Tons Let—45,800 Tons in New Projects

WITH two sections of the New York subway accounting for 26,000 tons, awards reported during the week amounted to 49,000 tons. New projects, calling for 45,800 tons, included a number of fair-sized jobs, the largest of which were a department store at Minneapolis, calling for 6000 tons, 10 oil tanks at Los Angeles requiring 5000 tons of plates, several buildings for a glass plant at Crystal City, Mo., taking 4500 tons and a Mississippi River dam near St. Paul, Minn., calling for 3500 tons. Awards follow:

CENTRAL VERMONT RAILROAD, 200 tons, bridges at Riverton and Royalton, Vt., to American Bridge Co.

SOMERVILLE, MASS., 350 tons, high school, to Boston Structural Steel Co.

NORTH EASTON, MASS., 200 tons, Ames Shovel & Tool Co. plant, to Berlin Construction Co.

BOSTON, 350 tons, school in Roxbury district, to Boston Structural Steel Co.

BOSTON, 150 tons, Woolworth store, to A. L. Smith Iron Works.

BOSTON, 100 tons, school, to Boston Structural Steel Co.

EVERETT, MASS., 100 tons, high school addition, to New England Structural Co.

BOSTON & MAINE RAILROAD, 150 tons, bridge, to Phoenix Bridge Co.

NEW YORK, 26,000 tons, section 2, route 106 and section 5, route 107 of municipal subway; awarded to American Bridge Co., subject to approval of Board of Estimate.

NEW YORK, 3800 tons, four public schools, to Bethlehem Fabricators, Inc.

NEW YORK, 2500 tons, apartment building at Park Avenue and Fifty-eighth Street, to Paterson Bridge Co.

NEW YORK, 900 tons, building at Dominic and Broome Streets, to Levering & Garrigues Co.

NEW YORK, 600 tons, Fur Merchants Building in West Twenty-eighth Street, to Harris Structural Steel Co.

NEW YORK, 500 tons, store and theater in Eighth Street, to Harris Structural Steel Co.

NEW YORK, 940 tons, apartment hotel in East Forty-ninth Street, to Dreier Iron Works.

STATE OF NEW YORK, 500 tons, highway bridges, to American Bridge Co.

STATE OF PENNSYLVANIA, 150 tons, highway bridge, to Phoenix Bridge Co.

PHILADELPHIA 700 tons, "out patients" building and laboratory for University of Pennsylvania, to American Bridge Co.

PHILADELPHIA, 150 tons, paint shop for Philadelphia Rapid Transit Co., to American Steel Fabricators.

NEW ORLEANS, 2060 tons, American Bank Building, reported awarded to Virginia Bridge & Iron Co.

DETROIT, 1750 tons, National Town and City Club building, to Whitehead & Kales Co.

DETROIT, 387 tons, warehouse for Carborundum Co., to Russell Wheel & Foundry Co.

JACKSON, MICH., 600 tons, building for Commonwealth Power Co., to Wisconsin Bridge & Iron Co.

STATE OF MICHIGAN, 230 tons, two highway bridges, to Massillon Bridge & Structural Co.

QUINCY, ILL., 1500 tons, Calhoun Avenue bridge, to Wisconsin Bridge & Iron Co.

CHICAGO, 600 tons, Harper School, to Hansell Elcock Co.

RACINE, WIS., 1000 tons, addition to Nash Motors plant, to Worden-Allen Co.

MILWAUKEE, 900 tons, addition for Seaman Body Corporation, to Worden-Allen Co.

SEATTLE, 130 tons, Pacific Coast Cement Co. plant, to Wallace Bridge & Structural Steel Co.

SAN FRANCISCO, 160 tons, apartment building, Union and Hyde Streets, to Western Iron Works.

GLENDAL, CAL., 220 tons, City Hall, to Llewellyn Iron Works.

LOS ANGELES, 150 tons, factory at 615 McKee Street, to McClintic-Marshall Co.

TACOMA, WASH., 400 tons, building for Hooker Electro Chemical Co., 100 tons, to Hofius Steel & Equipment Co.; 300 tons, to Austin Co., Cleveland.

The following Junior beams, totaling 1197 tons, have been awarded to Jones & Laughlin Steel Corporation:

Indianapolis, 113 tons, L. S. Ayres Department Store; Toledo, Ohio, 140 tons, Toledo Hospital; Cleveland, 142 tons, Jewish Orphanage; Huntington, L. I., 320 tons, Immaculate Conception Seminary; Saginaw, Mich., 100 tons, Adams Saginaw Building; Pittsburgh, 220 tons, apartment building; Decatur, Ill., 162 tons, junior high school.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

BOSTON, 160 tons, stores and offices on Washington Street.

NEW YORK, 700 tons, widening of Park Avenue at Fifty-seventh Street.

NEW YORK CENTRAL RAILROAD, 1000 tons, bridge at Rensselaer, N. Y.

ITHACA, N. Y., 600 tons, building for Cornell University.

PENNSYLVANIA RAILROAD, 3300 tons, 17 bridges; blue prints not yet available.

BALTIMORE, 1200 tons, pier shed for city.

PHILADELPHIA 1300 tons, Blackstone Hotel, Thirteenth and Locust Streets; F. E. Warner Co., general contractor.

PHILADELPHIA 1400 tons, Garden Court annex, Forty-seventh and Pine Streets.

MINNEAPOLIS, MINN., 6000 tons, department store.

ST. PAUL, MINN., 450 tons, addition for Seims-Stemle Co.

ST. PAUL, 3500 tons, Mississippi River dam.

MARINETTE, WIS., 200 tons, interstate bridge; Milwaukee Bridge Co., low bidder.

MILWAUKEE, 1850 tons, garage.

PEORIA, ILL., tonnage not stated, bridge across Illinois River.

SPRINGFIELD, ILL., 2500 tons, bids opened Sept. 18 on 124th Field Artillery Armory.

CHICAGO, 1000 tons, bridges for Sanitary District.

CHICAGO, 2000 tons, 19-story building on South Wabash Avenue.

GREAT NORTHERN RAILROAD, 1900 tons, bridges.

CHICAGO, MILWAUKEE, ST. PAUL & PACIFIC RAILROAD, 975 tons, girder spans.

CRYSTAL CITY, Mo., 4500 tons, building for Pittsburgh Plate Glass Co.

CAMP LEWIS, WASH., 200 tons, for additions.

SEATTLE, 400 tons, for Sand Point hangar.

SEATTLE, 200 tons, State highway bridge.

OLYMPIA, WASH., 230 tons, Kalama River bridge; Gilpin Construction Co., Astoria, Ore., low bidder on general contract.

OLYMPIA, 120 tons, Coweeman River bridge; J. J. Badraun, Portland, Ore., low bidder on general contract.

PORTLAND, ORE., 243 tons, Gardiner bridge over Yellowstone River in Montana; bids Sept. 28.

LOS ANGELES, 5000 tons of plates, 10 82,000-bbl. tanks for General Petroleum Corporation; bids being taken.

LOS ANGELES, 3100 tons of plates, 10 80,000-bbl. tanks for Shell Oil Co.; bids being taken.

SANTA BARBARA, CAL., 620 tons of plates, two 80,000-bbl. tanks for Rio Grande & Barnsdall Oil Co.

LOS ANGELES, 1135 tons, 60-in. discharge pipes for San Gabriel Dam; bids Nov. 14.

PERSONAL

RALPH W. CLARK has resigned as vice-president of Pilling & Co., New York and Philadelphia, and has been elected vice-president and general sales agent of the Hudson Coal Co., with headquarters at Scranton, Pa. Mr. Clark became New York manager of the pig iron department of Pilling & Co. in 1922. For 22 years before that he had been connected with Rogers, Brown & Co., starting in the Chicago office and later going to Buffalo, then to Boston, and in 1907 to the New York office. In the past 21 years he has been a well-known figure in the merchant pig iron trade of New York and New England. The Hudson Coal Co. is a subsidiary of the Delaware & Hudson Co. The latter company also owns the Chateaugay Ore & Iron Co., Lyon Mountain, N. Y., for whose pig iron Pilling & Co. are selling agents.

GEORGE S. JONES, recently assistant manager bar and specialty division, Republic Iron & Steel Co., Youngstown, has been appointed district sales manager in the Youngstown district, with headquarters at the company's general offices.

MURRAY M. BAKER, vice-president and chief sales executive of the Caterpillar Tractor Co., Peoria, Ill., has resigned but will continue as a director of the company. He has been associated with the organization since 1909. E. R. GALVIN, who has been located at the Cleveland branch, succeeds Mr. Baker as division sales manager.

CHARLES C. HENDERSON, vice-president Allegheny Steel Co., Brackenridge, Pa., has been elected treasurer of the company, succeeding R. D. CAMPBELL, who has resigned that office, but remains a vice-president and a director.

JAY S. IRVIN, formerly special representative Trumbull Steel Co., Warren, Ohio, has been named general manager of a new tin plate plant which the Columbia Steel Corporation is building at Pittsburg, Cal. Mr. Irvin at one time was manager of the Laughlin works, American Sheet & Tin Plate Co., Martins Ferry, Ohio, having resigned that position to become general superintendent of the Trumbull Steel Co. when it was organized in 1912.

JOSEPH A. BOHN has been appointed general manager of the Ames Iron Works, Oswego, N. Y., subsidiary of the Pierce, Butler & Pierce Mfg. Corporation, New York, to succeed the late Joseph C. Gaskill. Before going to the Ames plant, Mr. Bohn was cost accountant for the United States Heating & Lighting Cor-

poration, Niagara Falls, N. Y., and prior to his recent promotion he was successively cost accountant, assistant manager and plant manager at the Ames works.

JOSEPH T. GOUGH, safety engineer at the Massena, N. Y., plant of the Aluminum Co. of America, has resigned and plans to enter business for himself.

W. E. TIERNEY has been appointed representative in the South and Southwest for the Botfield Refractories Co., Philadelphia, with headquarters in New Orleans. He is a graduate in mechanical engineering from Tulane University, New Orleans.

JAMES J. ZIMMERMAN, for the last six years identified with the Elliott Co., Pittsburgh, maker of power plant equipment, has been appointed production manager for that company. His early training was obtained in the engineering, maintenance and production departments of the Cambria Steel Co., Johnstown, Pa., and prior to joining the Elliott Co. he was general superintendent of the Scott Foundry Department, Reading Iron Co., Reading, Pa.

EDWIN R. WEGENER was elected president, general manager and a director of the Detroit Forging Co., Detroit, at a meeting of the board on Sept. 10.

L. R. BEATTY has been appointed representative in the Philadelphia district for the Northwest Engineering Co., Chicago, maker of crawler equipment, shovels, cranes and draglines. His headquarters will be at 327 South Twelfth Street.

W. S. STEWART has been placed in charge of an office which has been opened by the Lincoln Electric Co., Cleveland, at 533 Market Street, San Francisco. A stock of motors, welders and arc-welding supplies is being carried. L. P. HENDERSON, who has been identified with the Lincoln Chicago office, has been placed in charge of the Minneapolis district. ROBERT NOTVEST, formerly at Kansas City, has been appointed Indianapolis district manager, and R. E. MASON has replaced him at Kansas City. N. L. NYE has been stationed at Akron, Ohio, under the direction of the Cleveland district office.

L. B. PUTNAM has been placed in charge of a branch office which has been opened by the United States Electrical Tool Co., Cincinnati, at 1641 Stout Street, Denver, Colo. J. R. BAUMBERGER goes to the company's sales organization at Dallas, Tex.

ALBERT WALTON, Melrose Park, Philadelphia, has been appointed Eastern representative of the Gray Iron Institute, Cleveland. He will maintain headquarters in Philadelphia and look after the interests of the Institute in New England, New York and Pennsylvania. Mr. Walton has been engaged in industrial engineering service for a number of years.

BENJAMIN SCHWARTZ, director general Institute of Scrap Iron and Steel, Baltimore, was the guest of the Connecticut members of that association at Bloomfield, Conn., Sept. 12.

JAMES L. DONNELLY, secretary Western Cartridge Co., East Alton, Ill., has been elected executive vice-president and secretary of the Illinois Manufacturers' Association, succeeding the late JOHN M. GLENN. The new secretary has been a director of the association for eight years and for the past year has been first vice-president. Associated with the Western Cartridge Co. for 13 years, Mr. Donnelly has served as secretary and legal advisor, director of sales and advertising and general secretary. He has been a director in the Western Cartridge Co. and several associated companies for a number of years.

HERBERT W. BONNELL has been appointed sales manager Northern Conveyor Co., Janesville, Wis., manufacturer of industrial and contractors' equipment. He formerly was sales manager of Fairbanks, Morse & Co., Beloit, Wis., and has been associated with a number of other large machinery manufacturers.

DR. H. W. HATFIELD of Sheffield, England, who will deliver the Campbell Memorial lecture at the annual convention of the American Society for Steel Treating in Philadelphia in the week of Oct. 8, and who is to speak at various places following that convention, will not appear at Boston and at the Massachusetts Institute of Technology Oct. 7 to 10, as announced in THE IRON AGE Aug. 30, but is scheduled to speak there Nov. 7 to 11. One lecture there will be before a joint meeting of the Boston chapter and the New England Foundrymen's Association, the subject probably to be cast iron.

L. W. STEVENS, who was assistant superintendent of the Veeder Mfg. Co., Hartford, Conn., prior to its merger with the Root Co., Bristol, Conn., is now superintendent at the Hartford plant of Veeder-Root, Inc., the consolidated company.

N. A. HELMER, formerly associated with Ford, Bacon & Davis, Inc., New York consulting engineers, has formed the Helmer Co., with offices in the Woolworth Building, New York, which will make investigations of plants and technical processes, devise

improvements in process work and equipment and supervise the installation and operations of equipment.

C. S. MARSHALL, formerly manager Worcester, Mass., district, American Steel & Wire Co., has been appointed district superintendent, and J. L. PERRY, who has been assistant manager, has been promoted to manager. Other changes announced in the Worcester district by H. A. BARREN, vice-president, are as follows: C. F. HOOD, superintendent South works, Worcester, and M. W. REED, superintendent New Haven, Conn., works, have been made assistant district managers; PETER STEWART, superintendent North works, Worcester, has been named general superintendent of the South works, and F. L. HAVEN, assistant superintendent North works, has gone with him to South works, as assistant; A. J. HOYT, assistant superintendent South works, has been made superintendent North works, and G. A. GREEN continues as assistant; E. W. BARNES continues as superintendent Central works, Worcester; H. W. JONES has been made superintendent New Haven, Conn., works, and R. C. HELM, metallurgist North works, has been named superintendent Trenton, N. J., works.

FRANK A. WEIDMAN, for seven years special representative for Inland Steel Co. at Chicago, has tendered his resignation to take effect Oct. 1. Previous to his connection with the Inland Steel Co. he was for 12 years with the American Sheet & Tin Plate Co. at Pittsburgh.

Company Changes

Sales offices of the Ashland By-Product Coke Co., Inc., and the Ironton By-Product Coke Co., Ashland, Ky., have been consolidated under the name of the Semet-Solvay Co. at 600 Dixie Terminal Building, Cincinnati. The sales office of the Ashland company at 966 Union Trust Building, Cleveland, will also be under the name of the Semet-Solvay Co., which operates coke plants at Ashland, Ky., and Ironton, Ohio.

The Inland Steel Co., Chicago, has completed negotiations for the purchase of the interest of Walter S. Prickett in the Michigan Mineral Lands Co. The principal tract involved is in Iron County, Mich., north of Crystal Falls. The Michigan Mineral Lands Co. owned half of this tract and the Cleveland-Cliffs Iron Co. owns the other half. It is the purpose of the new owners to hold this mineralized land in reserve to be investigated when present ore holdings show signs of depletion.

Ford, Bacon & Davis, Inc., New York engineering firm, has removed its general offices from 115 Broadway to 39 Broadway.

Industrial Relations Course at Springfield College

Announcement is made of the establishment of an industrial relations course at Springfield College (national Y. M. C. A. training institution) at Springfield, Mass., and of the appointment of John Calder, consulting engineer, as its director. Mr. Calder was for many years connected with important industrial establishments as a manager of production and in the past ten years has been consultant in industrial relations to a number of large concerns, being for four years manager of that department for Swift & Co. In recent years he has been a valued contributor to THE IRON AGE.

The object of the new course is to train industrial relations secretaries and other leaders who plan for service in industry, also to give the 600 students at Springfield College an acquaintance with the industrial side of modern life. Mr. Calder's books on "Modern Industrial Relations" and "Foremen Training" are well known and exemplify his practical and forward-looking views of the human problems of industry. In accepting the post at Springfield he plans to give all his time to the new work, as the college authorities look for such encouragement from manufacturing and engineering executives as will assure its permanence.

Large Purchases of Electrical Machinery

Youngstown Sheet & Tube Co. has bought a 7000-hp. blooming mill motor from the Westinghouse Electric & Mfg. Co., and a 5000-hp. billet and bar mill motor and a 2000-hp. skelp mill motor from the General Electric Co. The National Tube Co. also has been a big buyer of electrical equipment, having ordered motors for the six stands of its new continuous 13-in. skelp mill at McKeesport, Pa., aggregating 5600 hp. and a motor generator set from the General Electric Co. and driving motors of a total capacity of 3000 hp. and a motor generator set for the new expanding seamless pipe mill at Gary, Ind., from the Allis-Chalmers Mfg. Co.

Reliance Mfg. Co. Sold to Cleveland Bankers

The Reliance Mfg. Co., Massillon, Ohio, maker of lock washers, has been purchased by a group of Cleveland bankers headed by Otis & Co. and will be headed by new officers, who for some time have been important executives of the company. Frank C. McLain, president and founder of the company, will retire and Edison W. Hart, vice-president and works manager, has already tendered his resignation. W. H. Crawford, for many years secretary-treasurer, will be president of the new organization and

Howard J. McGinn, for some time sales manager, will become vice-president and general manager. The company's plant has a capacity of 4,000,000 washers a day, and is said to do about 50 per cent of all the business in this field. The company's assets are given as \$1,000,000, and it is stated that the sale price was \$2,500,000. The company will be reorganized with an issue of 80,000 shares of common stock, which will be placed on the market this week at \$38 per share.

Warwick Blast Furnaces To Be Sold at Auction

At a meeting of stockholders of the Warwick Iron & Steel Co. in Philadelphia, Sept. 12, it was voted to offer the plant and equipment, raw materials and property of the company at public auction on Oct. 10 and 11. The sale will be conducted by Samuel T. Freeman & Sons, Philadelphia.

The plant of the Warwick Iron & Steel Co., Pottstown, Pa., which from 1912 to 1926 was leased by the Eastern Steel Co., Pottsville, includes two blast furnaces with a total estimated capacity of 346,750 tons a year. No. 1 was built in 1910 and rebuilt in 1919-1920 and No. 2 was built in 1900 and rebuilt in 1919. The original No. 1 furnace was built in 1875 and dismantled in 1919.

Obituary

FRANK D. HAMILTON, formerly a well-known figure in the abrasive industry, died on Sept. 12, at Westfield, Mass., following an illness of several weeks. He was born at Chester, Mass., in 1858, and in 1904 organized the Hamilton Emery & Corundum Co., Chester, serving as its president for 10 years. In 1914 he organized the General Abrasive Co., Niagara Falls, N. Y., and was its president and general manager for several years. Later he organized the American Abrasive Co., Westfield, but retired from business several years ago.

CHARLES J. PECK, sales manager at Detroit for the Crane Co., Chicago, and president of the Detroit Engineering Society, died in Detroit, Sept. 9, following an operation for appendicitis. He was also a member of the Michigan Engineering Society and well known in engineering circles in Michigan, Indiana and Illinois.

ABEL H. CATLIN, president Chattanooga Machinery Co., Chattanooga, Tenn., died on Sept. 17, at Seneca Falls, N. Y., following an attack of heart disease. He was 80 years of age.

CLARENCE F. HOTCHKISS, president Stowe Mfg. Co., Binghamton, N. Y., died on Sept. 9.

Welsh-American Mills In Agreement

Reported to Have Limited Tin Plate Competition—French Public
Improvements to Use Large German Reparations Deliveries

(By Cable)

THE general iron and steel situation is improving. Pig iron consumers are considering making contracts and with Continental pig iron no longer competitive there is talk of blowing in additional Cleveland furnaces. Hematite demand is better, consumers showing increased interest in contracts and some makers beginning to supplement their output with shipments from stock.

Foreign ore is quiet on new business, but deliveries under old contracts have now been resumed from Swedish mines and prices are firm.

Finished steel demand is broadening, particularly in the domestic market for small sized material. Plate mills are still in need of orders. Baldwins, Ltd., is resuming operation of the Port Talbot heavy mills, as increasing cost of foreign steel is causing buyers to consider purchasing British material, especially semi-finished sizes.

Tin plate prices are firm as a result of the recent United States-

Welsh agreement for elimination of competition. As much as 18s. 4½d. (\$4.46) per base box, f.o.b. works port, is asked by some makers for far forward delivery. Mills generally are well sold for October through December.

Galvanized sheets are in active demand and prices are firmer. Black sheets continue quiet.

August exports of pig iron were 28,000 tons, of which the United States received 2500 tons. Total exports of iron and steel were 370,000 tons.

Continental markets are firm with continued demand from overseas users, especially in the Far East and India, but little of this business is passing through British exporters. Some Belgian mills are sold out to the end of November or December. British consumers are declining to pay the high prices now asked for steel by the European mills.

The lockout at the Tata steel works, Jamshedpur, India, has been ended after five months duration.

be tax free, whereas at present exemption is limited to incomes of less than 7,000 fr.

Appropriations that may aid industry include 9,000,000 fr. to be expended for development of water-power, 35,000,000 fr. for the improvement of seaports, 40,000,000 fr. for aviation development and 50,000,000 fr. for road improvement, to which is added credits for national defense. Reparations payments by Germany will play a part in much of this expenditure, however, as the Government intends seeking the authorization of the Parliament for placing at the disposal of various departments reparations deliveries from Germany amounting to 1,200,000,000 fr. This material would be used for extensive work both in metropolitan territory and in the colonies.

French industry foresees some advantage through the credits afforded under the Loucheur Act for the construction of low-priced dwellings, but on the whole considers the budget rather disappointing. It is hoped, however, that, even though large quantities of materials going into public works are furnished by Germany as reparations, in the end industry will benefit through improved economic equipment throughout France.

Pig Iron.—The quantity of phosphoric foundry iron available for domestic consumers in September has been continued at 30,000 tons. Prices are unchanged. In the north of France,

German Material for French Projects

New Budget Plans Use of Large Reparations Shipments for
Public Improvements—French Mills Well Filled

PARIS, FRANCE, Aug. 27.—The budget for 1929 does not afford French industry much relief from taxation.

The only reduction forecast by the new budget is in the tax on wages. Incomes of less than 10,000 fr. are to

British and Continental European prices per gross ton, except where otherwise stated, f.o.b. makers' works, with American equivalent figured at \$4.86 per £ as follows:

Durham coke, del'd.....	£0 17½s.			\$4.25	
Bilbao Rubio ore.....	1 2	to £1 2½s.		5.35	to \$5.48

(a) Nominal.

competition from Dutch hematite iron, particularly from Ymuiden, is keen.

Semi-Finished Material.—Some of the more important producers have withdrawn from the market temporarily, and export prices are quite firm. Blooms are quoted at £4 13s. (\$22.60) per metric ton, billets at £4 15s. 6d. (\$23.21) per ton and sheet bars at £4 18s. (\$23.81) per ton, f.o.b. Antwerp.

Finished Material.—Mills are well filled with domestic business and are not actively seeking export tonnage. Delays in delivery to domestic consumers in some cases range from four to five months, and many producers are refusing to accept orders on which earlier shipment is specified. For export, deliveries are six to eight weeks on practically all products. British specification beams are quoted at £4 19s. to £5 per ton (1.09c. to 1.10c. per lb.), and ordinary specifications at £4 18s. per ton (1.08c. per lb.). Merchant bars range from £5 17s. 6d. to £5 18s. 6d. per ton (1.29c. to 1.30c. per lb.). Sheet prices are firm but do not show the tendency toward further advances that is still evident in merchant products. With fall approaching the question of a "comptoir" to control sheets will probably again be discussed. The Société des Acieres de Chatillon, Commentry et Neuves-Maisons, will shortly put into operation its sheet mills in the center of France. The output of these mills is special automobile sheets. Renewed operation of the mills is understood to be with technical cooperation of the American Rolling Mill Co., Middletown, Ohio.

Luxemburg Trade with Far East Improves

LUXEMBURG, Aug. 22.—Until July 11, when the Antwerp strike of dock workers ended, the market here was decidedly weak, but thereafter recovery was rapid and prices reached a satisfactory level by the end of the month. Business has continued good, and, with large public works projected in France, it is believed that domestic demand in that country will be sufficient for some time to occupy the steel mills there and reduce French competition for export trade.

Refusal of Premier Baldwin in Great Britain to recommend to Parliament action on steel importation, under the Safeguarding of Industries Act, is viewed with satisfaction here and is believed to have removed the possibility of restriction on foreign steel in England until the next general elections there. Trade with India is irregular, affected by sporadic strikes and the monsoon season. Although cessation of hostilities in China has not yet brought out an increase in demand for iron and steel, some improvement is reported in business with Hong Kong. Japanese sheet mills are well engaged, with orders for several months, and have advanced their prices—a development favorable to European business.

Belgian Mills Quote December Delivery

Prices Strong on Small Sizes but Some Tonnage Is Sought in Heavy Beams—Exports to Far East Improving

ANTWERP, BELGIUM, Sept. 1.—Domestic activity in iron and steel is at a high rate, and export sales to some markets are increasing. Transactions are slightly smaller than a week or two ago, as the most recent advance brought some quotations to the level of British prices. However, with mills well booked ahead and consumers of iron and steel operating at a good rate, present prices are expected to be maintained. Deliveries have greatly extended, and buyers report considerable difficulty in obtaining small-sized bars. In some instances mills are offering shipment in December and January. Meanwhile, export inquiry from China and Japan is larger than had been expected, although not particularly satisfactory in the heavier structural steel sizes.

Pig Iron.—The domestic market on No. 3 phosphoric foundry iron has been advanced 1 belga per metric ton and is now 117 belgas (\$16.25) per ton, f.o.b. furnace. Export quotations on this grade range from as high as £3 4s. (\$15.55) per ton, f.o.b. Antwerp. Bessemer hematite is quoted at about 130 belgas (\$18) per ton, furnace, which is equivalent to the British export price to Belgian consumers. Demand for all grades of iron continues active, and the tendency of prices is toward greater strength.

Semi-Finished Material.—The tendency of prices is upward, with very little material available for early delivery. Billet prices range from £4 17s. (\$23.57) per ton for 3-in. to £4 18s. 6d. (\$23.93) per ton for 2-in. Stocks of blooms are small and prices are firm at £4 9s. (\$21.63) per ton for 8-in., £4 12s. (\$22.36) for 6-in. and £4 16s. (\$23.33) for 4-in. Mills are heavily booked with orders for sheet bars, and the usual price for normal specifications is £5 (\$24.30) per ton, f.o.b. Antwerp.

Finished Material.—Demand has decreased slightly but is still considerably in excess of supply. In consequence, prices are advancing except on certain of the larger sizes of beams, on which mills are still seeking some tonnage to complete rolling schedules. Small sizes of steel bars are in most cases not obtainable for earlier than December-January shipment from the mill. China, Japan and the East Indies are buying rather actively, and other foreign markets are expected to develop into purchasers in the next few months. Bar prices are about £6 2s. per ton (1.34c. per lb.), f.o.b. Antwerp, but some makers have been asking as much as £6 5s. per ton (1.38c. per lb.), with deliveries in December and January. On decidedly favorable specifications £6 1s. per ton (1.33c. per lb.) is occasionally quoted. A factor contributing to present market strength is the strong

position of French and Luxemburg makers and the well booked condition of German mills. Other products are in a position similar to that of bars, except large-sized beams, on which the price is stationary at £4 19s. per ton (1.09c. per lb.), f.o.b. Antwerp.

Competition for Contractors' Equipment in Europe and Asia

F. E. Bauer, of the New York sales office, American Hoist & Derrick Co., St. Paul, has returned from an eight months' business visit to France, Spain, Egypt, India, Mesopotamia and Persia. Although he found among French contractors a preference for locomotive cranes, steam shovels, hoists and derricks made in the United States, German equipment delivered on reparations is largely used at present. Such machines may be bought by the contractor from the French Government, which credits the German machine to reparations and extends credit in cases for a year. On some heavy types of equipment, however, such as large capacity power shovels and wrecking cranes, not generally produced in Germany, a field continues for the American product. In India and Mesopotamia contractors are largely British and express preference for British equipment unless the bid of the American maker represents a considerable saving. They point out that having offices or connections in England, there is no problem of inspection of the machine bought, such as would arise with a purchase of a United States product.

Higher Prices on Wire Rods Expected in Europe

HAMBURG, GERMANY, Sept. 2.—It is generally expected that the International Wire Rod Syndicate will increase the price of wire rods for export from £6 (\$29.16) to £6 2s. (\$29.65) per ton, f.o.b. Antwerp. Further increases in the prices of other steel products for export are also looked for, as it is estimated that German steel producers sold practically their entire allotment for the quarter, during July and August. Since the penalty for exceeding the allotment set by the International Steel Cartel is \$1 a ton, higher quotations by German mills will probably develop this month.

Showing a decline of 11, August shipments of electric industrial trucks and tractors represented 96 units against 107 in July, according to the Department of Commerce.

Smaller Orders for Steel Furniture and Shelving

Orders for steel furniture in the "business group" in July were valued at \$2,594,216, against \$2,764,085 in June, according to reports received by the Department of Commerce from 34 manufacturers. The July orders were the lowest for any month since last November. Shipments were valued at \$2,515,482, compared with \$3,009,239, while unfilled orders were valued at \$2,071,553 and \$1,992,665 respectively. A year ago orders in July were \$2,091,804. For the seven months ended with July orders were valued at \$21,186,638, against \$18,273,501 for the corresponding period of last year; shipments were valued at \$20,594,190 and \$18,435,993 respectively.

Shelving furniture orders in July were valued at \$713,330, against \$737,060 in June, and shipments were valued at \$722,516 and \$720,253 respectively. Unfilled orders at the end of July were valued at \$705,657, against \$729,310 at the end of June. Orders a year ago were \$534,875 in July. For the seven months ended with July orders were valued at \$5,275,125, compared with \$4,405,566 for the corresponding period one year ago; shipments were valued at \$5,121,731 and \$4,341,054 respectively.

Newark District Adds 417 New Plants in Three Years

New manufacturing plants which have located in the Newark, N. J., district since the beginning of 1926 number 417, according to a survey completed by the Newark Chamber of Commerce in cooperation with the Bureau of the Census, Department of Commerce. Electrical goods and appliances account for 17. The next important industry is radio apparatus, embracing 15 new companies. Among the articles added to the list of products made in the Newark district are steel savings banks, lead castings, lunch wagons, hospital supplies and equipment, motor pulleys, etc.

Russian Steel Production Unsatisfactory

MOSCOW, RUSSIA, Aug. 28.—Official reports state that the heavy iron and steel industry is in an unsatisfactory position. Scheduled production programs have not been fulfilled. Output of pig iron in July was 267,613 metric tons, compared with 271,943 tons in June. Steel ingot production in July was 312,127 tons, compared with 336,636 tons in June. Output of rolled steel products was 233,635 tons in July, compared with 271,173 tons in June.

The director of the Glavmetal board has pointed out to the metallurgical plants that there are deficiencies in blast furnace output. He points to frequent cases of damage to plants, inefficient technical supervision and

neglect to follow official instructions on reduction of working costs.

The quantity of pig iron available for the engineering and other consuming industries in the current business year is 92,000 tons less than in the preceding year. Since the fiscal year 1926-1927, the shortage of pig iron in the consuming industries has increased from 7 per cent to 25 per cent and the shortage of rolled products has advanced from about 12 per cent to 24 per cent.

Heavy Construction in August

Construction contracts amounting to \$516,970,000 were awarded in August in the 37 States east of the Rocky Mountains, according to F. W. Dodge Corporation. This represents about 91 per cent of the total construction volume of the country. There was a reduction from July of about \$66,000,000, or 11 per cent, while the current figure was less than that of a year ago by \$35,000,000, or 6 per cent. Residential buildings accounted for 41 per cent of the total, or \$213,705,000. Public works and utilities called for \$118,890,000, commercial buildings for \$58,910,000 and industrial projects for \$42,607,000.

Total contracts for the first eight months of the year aggregated \$4,545,270,000, a gain of 6 per cent over last year's \$4,274,871,000 for the same period. Most of the districts showed a drop from July, but the Northwest indicated a reversed tendency, with an increase of 21 per cent over July and of 6 per cent over a year ago. The amount was the highest for August ever recorded in that district.

Timken Roller Bearing Co. Forms Steel and Tube Subsidiary

The Timken Roller Bearing Co. announces the incorporation of the Timken Steel & Tube Co., which will take over the manufacture and selling of Timken steel and tubing. The headquarters and mills are in Canton, Ohio, with sales offices in Chicago, Los Angeles, Detroit and New York. Officers are: H. H. Timken, chairman; M. T. Lothrop, president; J. W. Spray, vice-president; A. J. Sanford, vice-president in charge of sales; J. E. Daily, vice-president in charge of operations; J. F. Strough, secretary and treasurer.

The company has been organized to take care of the growing demand for Timken steel among manufacturers of various products, by the production of high-grade alloy steels on a quantity basis. Its production facilities consist of modern furnaces and mills with a capacity of 30,000 tons of steel per month. This capacity is equally divided between electric and open-hearth steels. The mill is equipped to supply any section or size of hot-rolled bar stock or seamless tubing in

any quantity. Specialized high-grade alloy steels will be produced to conform to any analysis specified.

The use of Timken steel, both bar and tubes, has expanded rapidly over the past few years to include many industries and diversified applications in each industry. In the automotive industry it is used for gears, axles, connecting rods and rear axle sleeves. In the oil industry it is used for making bits and jars, and the tubing is used for oil well pump construction. The steel is also used in airplane engine construction, for electric motor shafts, for machine tool parts and cutting tools, and, in the case of the tubing, for many sorts of mechanical construction.

New Bonded Chrome Sheet on Market

"Apollo Chrom," produced by the Apollo Metal Works, La Salle, Ill., is one of the various metals produced by that company which are offered in sheets ready for immediate fabrication without the necessity for plating, polishing, lacquering, japanning or other finishing.

It is a finished metal having for its base highly refined zinc, specially rolled, to which has been bonded copper and nickel and then chromium. This finish is not plating; on the contrary, the process binds together these metals into a sheet that can be bent, stamped, formed, double-seamed and can be put through operations necessary in fabrication.

Apollo Chrom will not crack, chip or peel when submitted to these various mechanical operations, it is stated. As it is non-rusting, non-tarnishing and corrosion-resistant, it is offered especially as a metal for the production of quality products. It is light in weight, being 33 per cent lighter than copper. It has a silvery, mirrorlike surface that will give a long life under rigorous conditions, it is asserted.

The manufacturing processes are under careful inspection, and various laboratory tests are made daily to keep check on quality and to lower production costs. The metal is now offered in sheets up to 36 x 96 in., in gages from 0.008 to 0.070 in.

Opportunity is now afforded to engineers, chemists and other technicians located in the metropolitan district of New York to pursue graduate study during the evening hours. The Polytechnic Institute of Brooklyn offers, this fall, four graduate courses in the evening which lead to the master's degree in chemistry or civil, electrical or mechanical engineering.

The Interstate Commerce Commission has announced that oral argument on the application of the Pittsburgh, Lisbon & Western Railroad to construct branches which would connect the Youngstown district with the Ohio River will be heard in Washington on Sept. 27.

Slight Reduction in Industrial Activity

Productive activity in the United States, as measured by electrical energy consumption, reported by *Electrical World*, is given as 119 in August compared with 120.2 in July and with 110.6 in August a year ago. The base of 100 is the average monthly figure for 1923-1925. The average for the first eight months has been 119.8, compared with 115 in the first eight months of 1927.

Metal industries, both ferrous and non-ferrous, have been well above the average of all groups this year, while last year at this time they were below the average of all groups. The metal industries group showed 125.5 in August, compared with 124.2 in July and with 104.6 in August, 1927. Its average for the first eight months was 124.4 this year and 113.9 last year.

Both the rolling mill and steel plant classifications and the metal-working plants (ferrous and non-ferrous) showed an August figure almost precisely the same as for the group. The rolling mill and steel plants recorded a substantial advance from July, whereas the metal-working plants showed a fractional decline. Automobile plants, including plants making parts, are classified separately from metal-working. They showed 124.7 in August, against 143.7 in July and 108 in August of last year.

Large Nickel Reserves in Both Canada and New Caledonia

Thomas W. Gibson, in a chapter on nickel in the forthcoming volume, "Mineral Industry, 1927," looks for generous supplies of nickel in coming years. Even though the world's production is confined to two localities, each has been shown to have practically unlimited reserves.

Sudbury mines in the Province of Ontario, Canada, now contribute about 85 per cent of the output. The other leading source is the island of New Caledonia in the South Pacific. The latter deposits are much smaller in size and somewhat richer in nickel content, running from 4 to 8 per cent nickel, but carry no copper. The Sudbury mines are of large dimensions, some of them containing many millions of tons of ore, reserves being placed at about 150,000,000 tons; in New Caledonia, a mine of 400,000 tons is considered large.

An unexpected development has taken place within the last two years in one of the largest mines of Sudbury. The Frood deposit, part of which is owned by the International Nickel Co. and part by the Mond Nickel Co., has been proved to contain a very large body of ore containing the average percentage of nickel, but running up as high as 20 per cent in copper. It appears to Mr. Gibson that the future of both of these com-

panies will be concerned with copper quite as much as with nickel. The market for nickel is comparatively restricted, since the metal is used mainly in alloys. On the other hand, copper is one of the major metals; the demand is not likely to decrease but to increase. The problem of the Sudbury companies, which must necessarily mine the nickel along with the copper, will be to bring about a still further increase in the demand for nickel, so that while producing their copper they may not be obliged to accumulate stocks of the higher-priced metal beyond the ability of the market to absorb.

Le Bulletin du Commerce of Nouméa, New Caledonia, compares the nickel situation in that island and in Canada. It describes the reserves of ore in New Caledonia as large; up to the year 1926 it was computed that only eight grants of land were being worked out of 522 concessions. The electric furnace provides for the treatment of ores of lower grade than those now smelted in the blast furnace, for which the nickel content must be not lower than 5 to 6 per cent. Of such ores, *Le Bulletin* asserts there are practically unlimited supplies, "since two-thirds of the rock surface of New Caledonia is made up of nickeliferous serpentines." It is anticipated that certain industries which do not require pure nickel will substitute ferro-nickel for their steels and special alloys, and thus open up new markets. The defect in the New Caledonia ore is that it does not produce any by-product, such as Monel metal or the silico-nickel of the Canadian ore.

British Foreign Trade in Steel Expanding

WASHINGTON, Sept. 17.—Imports of iron and steel into Great Britain in August increased sharply while exports showed a smaller gain, the former rising to 272,368 gross tons from 218,957 tons in July and the latter amounting to 333,079 tons, against 333,079 tons, according to a cablegram received by the iron and steel division, Department of Commerce, from William L. Copper, commercial attaché at London. Increases were made in all of the important import items.

British Foreign Trade in Iron and Steel Products
(In Gross Tons)

Item	Imports		Exports	
	July	August	July	August
Pig iron and ferroalloys.....	5,286	7,363	32,272	32,451
Ingots, blooms, billets and slabs.....	95,344	114,472	841	613
Iron bars, rods and angles.....	13,703	18,502	2,558	2,237
Steel bars, rods and angles.....	37,367	45,148	25,136	23,621
Structural steel.....	12,326	20,076	6,337	6,780
Hoops and strips.....	12,452	12,948	7,096	7,193
Plates and sheets.....	10,970	17,530	44,318	50,602
Galvanized sheets.....			51,579	65,546
Tin plate.....			43,584	53,168
Cast tubes, pipe and fittings.....	2,256	4,005	7,541	9,096
Wrought tubes, pipe and fittings.....	4,879	5,254	20,237	24,649
Rails.....	1,007	863	34,897	31,411
Other railroad material.....	430	992	15,838	14,891
Wire.....	5,215	6,136	6,511	8,006
Wire cable and rope.....			2,326	2,347
Wire nails, including staples.....	5,984	6,464	169	246
Other wire manufactures.....	767	740	1,676	2,282
Nails, tacks, rivets and washers.....	889	1,718	1,185	1,518
Bolts, nuts and screws for metal.....	1,401	1,121	2,169	2,170
Iron and steel castings.....	1,618	1,505	265	106
Iron and steel forgings.....	931	956	46	72
All other.....	6,132	6,575	26,498	30,719
Total.....	218,957	272,368	333,079	369,773

British Output Declined Again in August

LONDON, ENGLAND, Sept. 17 (*By Cable*).—Pig iron output in August was 519,000 gross tons and production of steel ingots and castings was 648,300 tons, both showing decreases from recent months.

A comparison of the August output with that of the seven preceding months of the year, and with the monthly rate for previous years is as follows, in gross tons:

	Pig Iron, Tons	Steel Ingots and Castings, Tons
1913—Av. monthly..	855,000	638,000
1920—Av. monthly..	669,500	755,600
1922—Av. monthly..	408,500	490,100
1923—Av. monthly..	620,000	706,800
1924—Av. monthly..	609,900	685,100
1925—Av. monthly..	519,700	619,400
1926—Av. monthly..	203,500	296,700
1927—Av. monthly..	607,800	758,200
1928—January.....	560,600	626,200
1928—February.....	560,800	764,400
1928—March.....	592,600	793,300
1928—April.....	555,000	644,100
1928—May.....	591,500	752,700
1928—June.....	563,700	709,500
1928—July.....	537,800	666,900
1928—August.....	519,000	648,300

The August pig iron output was the smallest thus far this year.

New Record in Portland Cement Production

Production of Portland cement in August is reported by the United States Bureau of Mines at 18,730,000 bbl., an increase of 7½ per cent over the July figure of 17,445,000 bbl. The month's output makes a new high record, displacing that of August, 1927, when production was 18,315,000 bbl. Production in the first eight months is also a new high record, having been 113,180,000 bbl., against 110,781,000 bbl. in the corresponding period of last year.

Shipments ran ahead of production. The total for August was 21,970,000 bbl., compared with the record of 21,411,000 bbl., in August, 1927. The current figure is 10 per cent ahead of the 19,901,000 bbl. shipped in July. Stocks at the end of August were 19,340,000 bbl., the lowest figure since Nov. 3, 1927. They were more than 3,000,000 bbl. above the stocks at the end of August, last year.

New England Foundrymen Meet

H. A. Lincoln, works manager, and James Prendergast, foundry superintendent, Sullivan Machinery Corporation, Claremont, N. H., and J. R. Linney, vice-president Chateaugay Ore & Iron Co., Lyon Mountain, N. Y., were the speakers at the September meeting of the New England Foundrymen's Association, Wednesday evening, Sept. 12, at the Exchange Club, Boston.

Previous to the speaking there was a short business session, presided over by Charles F. Miller, president. The Jefferson Union Co., Lexington, Mass., and Walter M. Saunders, Providence, R. I., were elected members of the association. Later Mr. Saunders was made official chemist of the organization.

Mr. Linney's address was accompanied by some 75 lantern slides. His story began with the mining of ore at a depth of 1685 ft. and ended in the Chateaugay Ore & Iron Co.'s foundry. The major part of the talk was taken up with the treatment and handling of ores. Some interesting pictures and facts were given regarding the casting of car wheels and cast iron pipe running as high as 4900 lb. in weight. In connection with the operation of the mines and treatment of ores, views were shown of the electric control house, which is notable for its arrangement and equipment.

The contribution of Messrs. Lincoln and Prendergast had to do with the hydraulic process of cleaning castings and will be found elsewhere in this issue.

Increasing Vogue for Color in Kitchens Shown by Metal-Ware Shipments

WASHINGTON, Sept. 14.—July shipments of enameled sheet-metal ware were 277,936 dozens, valued at \$1,059,454, compared with 299,078 dozens, valued at \$1,141,196, in June, and with 248,599 dozens, valued at \$898,240, in July of last year, according to reports received by the Department of Commerce from 18 manufacturers comprising approximately 80 per cent of the industry.

For the first seven months the total has been 2,412,117 dozens, valued at \$9,051,064, against 2,359,788 dozens last year, valued at \$8,227,724. The increase has come wholly from the colored goods, which have aggregated \$2,202,981 this year, against only \$495,548 last year. This depicts the growing trend to put color into kitchens. Both the white goods and the gray dropped off by 10 per cent or more.

Shipments of galvanized sheet-metal in July comprised 169,271 dozens, valued at \$677,451, compared with 189,219 dozens, valued at \$722,086, in June, according to reports received by the Department of Commerce from 15

concerns which represent a large proportion of the industry.

For the first seven months the total has been 1,397,644 dozens, valued at \$5,338,165, compared with 1,311,913 dozens last year, valued at \$4,963,614. Gains were recorded in both groups—pails and tubs, and "other ware."

South Africa to Exhibit Ores at German Fair

HAMBURG, GERMANY, Sept. 2.—Considerable interest has been aroused by a recent announcement that the Government of South Africa plans to exhibit iron, manganese, tin, copper and chrome ores at the Frankfort Fair, Sept. 30 to Oct. 4. This is the first such exhibit by South Africa and is believed to be the outcome of negotiations with German steel interests such as the Friedrich Krupp A. G., and the Vereinigte Stahlwerke, which are interested in exploiting the rich ore fields of Postmasburg and the iron ore deposits in Natal. About 10 tons of various ores will be exhibited.

Statistical Measures of Business Conditions

Construction volume in August is estimated by the Associated General Contractors of America at 239, based on 100 as the average month of 1913. This is the second highest rating ever reached, that for June having been 244; July was 237. The highest previous to 1928 was August, 1927, with 238.

Total production of petroleum in the United States in 1927 is reported by the Bureau of Mines at 901,129,000 bbl., by far the highest output on record. It compares with 770,874,000 bbl. in the preceding year, the gain being 17 per cent. More than 60 per cent of the production of the year came from the Mid-Continent field, while a little more than 25 per cent came from the California wells.

Total production of Portland cement for the first seven months of 1928 amounted to 94,436,000 bbl., compared with 92,466,000 bbl. in the same period of 1927. Total shipments from January to July, 1928, inclusive, amount to 93,851,000 bbl., compared with 93,759,000 bbl. in the same period of 1927.

Average weekly earnings in representative New York State factories in July are reported at \$29.15 by the State Industrial Commissioner. This is a reduction of 33c. from the June average and, with the exception of April, is the lowest figure since last November. Only three months of the last 23 have been lower. One of these was July, 1927, when \$28.95 was recorded.

Production of bituminous coal in the week ended Sept. 8 is reported by the United States Bureau of Mines at 8,934,000 net tons, a reduction having occurred because of Labor Day. The total for the calendar year through Sept. 8 was 321,699,000 tons, comparing with 363,294,000 tons in the corresponding period of 1927.

Electric power produced by public utility power plants in the United States in July is reported by the Geological Survey at 7136½ millions of kwhr., compared with 7009 in June and 7130 in May. The proportion made by water-power declined to 43 per cent in July, from 44.3 per cent in June and 44.7 per cent in May. While daily output in July was lower than in several of the earlier months of 1928, only one month of any previous year (December, 1927), exceeded the record of July.

Shipments of electric industrial trucks and tractors in July are reported by the United States Department of Commerce at 107, the lowest figure since last December. It compares with 117 in June and with 90 in July, 1927. For the first seven months the total was 839, compared with 785 for the corresponding period of 1927.

Consumption of babbitt metal in July is reported by the Department of Commerce at 4,692,825 lb. This is a slight reduction from the 4,731,023 lb. of the preceding month but is higher than the 4,604,786 lb. of July, 1927. For the first seven months there has been a drop of 7 per cent, from 35,735,478 lb. to 33,199,922 lb.

Production of automobiles in Canada in July, as reported by the Dominion Bureau of Statistics, included 20,122 passenger cars and 5104 trucks, compared with production in June of 25,341 passenger cars and 3058 trucks, and production in July, 1927, of 8719 passenger cars and 2268 trucks.

Preliminary figures of an August production of 485,000 cars and trucks carry with them the virtual certainty that the automotive industry will set up a new production record in 1928, says *Automotive Industries*. To do this it must exceed the 4,424,538 total of 1926. Retail sales in July in 17 representative cities showed an increase of 38 per cent over July last year.

Blast furnaces in the Saar produced 952,220 metric tons during the first six months of 1928 as against 879,863 tons in the first half of 1927, while steel production was 1,020,855 tons and 946,600 tons, respectively, according to a report received by the Iron and Steel Division, Department of Commerce.

New German Freight Rates Do Not Apply to Exports

HAMBURG, GERMANY, Sept. 2.—Producers of steel and metal for export will not be affected by the advance in freight rates to go into effect about Oct. 1. Railroad freight rates on material moving to ports for export will continue unchanged, and in the case of certain non-ferrous metals have been reduced. Domestic business has already been affected by the projected increase in freight rates, and an active trade is reported in orders for prompt shipment.

Convention Hall Near Albany Is Planned

The Simmons Machine Tool Corporation, Albany, N. Y., has purchased from the General Railway Signal Co., a building, located between Albany and Troy, which is being remodeled for convention purposes. Posts supporting the roof will be removed and 100-ft. steel trusses installed. The building consists of two floors, containing 35,000 sq. ft. each, and will be equipped with power lines for use in operating machinery at conventions or shows. The hall is served by a railroad siding and has a seating capacity of 8000.

Foundry Problem Bulletins

A series of discussions of present-day foundry problems will be published by Whiting Corporation, Harvey, Ill., from the pen of Dr. Edward E. Marbaker. Dr. Marbaker is investigating such problems at Mellon Institute of Industrial Research, Pittsburgh, and an article by him on "Heat Treatment of Gray Iron" appeared in THE IRON AGE, Aug. 2, page 282. Copies of these publications will be mailed to those requesting them from the Whiting Corporation.

Davison Company Takes Over Neville Furnace

Name of the Sharpsville Furnace Co., with a blast furnace at Sharpsville, Pa., which recently acquired the Neville furnace, owned by the American Steel & Wire Co., but long operated by the Carnegie Steel Co., has been changed to the Davison Coke & Iron Co., the family name of the dominant interest in the company. The new company on Sept. 12 formally exercised its option on the furnace together with 260 acres of land adjacent to it on Neville Island, which is in the Ohio River a short distance from Pittsburgh. The furnace is in shape for immediate operation, but the new owners will install two turbo-blowers and it is not expected that the stack will be blown in until about March 1, 1929. The company also has completed the engineering de-

tails for a new power plant, a cement works and a by-product coke plant. Surveys and excavating work already have been started.

Manless Power Distributing Station

A manless electric distributing station that will ultimately be able to supply power sufficient to light the homes of approximately 300,000 families and will be operated without a human being inside its walls, was put into service on Sept. 17, at 238th Street and Spuyten Duyvil Road, New York, by the New York Edison Co. The station will be controlled from another station more than three miles away. The distant operator can close or open any switch, placing in service the various transformers and circuits in the new station by pressing keys which send over wires electric im-

pulses of the dot and dash system, used in telegraphy. Also he will receive automatic signals from the station which will inform him whether the equipment is functioning properly.

The control system was devised by the Westinghouse Electric & Mfg. Co. The station will receive from the generating stations current at 13,200 volts and distribute it at 2300 volts.

New Great Lakes Car Dumper

Plans for a new electric car dumper, expected to set a new record for speed, have been completed by the Toledo & Ohio Central Railroad. The dumper will be built by Heyl & Patterson, Pittsburgh, and is expected to be completed in March, 1929. It will be located at Toledo. The electric equipment will be supplied by the General Electric Co.

American and Foreign Wages Compared

Comparisons of daily wage rates in rolling mills, building trades and coal mining and farming have been made by the United States Bureau of Labor Statistics. The figures are taken from the latest available data, mainly for the United States, Great Britain and Germany. In some cases, however, additional figures are given covering France, Austria, Belgium, Italy, Czechoslovakia, Norway and

Sweden. The comparisons are given in the tables and are shown graphically in the diagram appended.

Wages in the United States were at their peak in 1920. Hourly wages at that time were 134 per cent higher than in 1913. The depression of 1921 brought the average down and, though there was a further shrinkage in 1922, they still were more than twice the 1913 level. Since then there has been a steady increase until in 1926 wages were 129 per cent higher than in 1913.

Country	Rolling Mills		Building Trades			Coal Miners
	Heaters	Laborers	Bricklayers	Carpenters	Laborers	
United States	\$7.60	\$3.28	\$12.56	\$10.16	\$4.00	\$6.26
Great Britain	4.36	1.61		2.96		9.65
Germany	1.81	1.64				2.02
	4.57	1.40				2.65
France		2.07	1.84	1.86	1.47	
Austria			1.57			
Belgium			1.39		1.12	
Italy			1.32	1.36	0.91	
Czechoslovakia				1.82	0.80	
Sweden				1.12		
Norway					3.09	
					1.88	

Graphic Comparison of Daily Wages in Various Trades in Several Countries

Alloy Bridge Steel Sixty Years Old

(Continued from Page 686)

than the bolts, weighing from 400 to 750 lb., depending on the thickness, but were of paramount importance to the bridge as designed, because from them were to be built the main arches to carry the entire loads back to the masonry. Some six months was required to get the rolling mill into satisfactory operation. Each change in shape of pass would cause a two-week shutdown. When rolled bars of proper shape were finally produced by this cut-and-try method, the steel proved inferior; both in full sized and small tests the elastic limit in compression proved to be 17,000 to 18,000 lb. per sq. in.

This disappointing outcome would have been fatal to the bridge had not the Chrome Steel Co. of Brooklyn previously furnished two anchor bolts which had not only passed the proof test properly, but test bars cut from the ends developed 119,000 to 161,900 lb. per sq. in. ultimate strength. In view of this successful showing, small ingots of chromium steel were rolled into staves; they worked nicely and passed the tests without difficulty. Chromium steel thus appeared to be the solution of the problem. Consequently C. P. Haughian, superintendent of the Chrome Steel Co., was engaged on Aug. 6, 1871, to instruct the Butcher employees how to make and roll chromium steel staves. He guaranteed to make 100 of them without a single failure under test, which he did by Sept. 21 of that year. For his services and the patent rights he was paid \$15,000.

Julius Baur, of New York, was the first to produce chromium steel on a practical scale, even though Faraday and Stodart made it experimentally as far back as 1820. In 1865 a patent issued to Baur claims "a steel greatly improved, toughened and hardened by the addition of chromium." By 1878 only two other sources were available, Sheffield in England and Unieux in France. The methods then in use may be inferred from a description of the Brooklyn Chrome Steel Works printed in the *Stevens Indicator* in 1892. Scrap iron and own chromium steel scrap were placed in German clay crucibles, plumbago lined, together with a flux of sodium carbonate. Chromium, in the form of chrome-iron ore, manganese oxide and carbon were also added to make up the 100-lb. charge. Two crucibles were charged into a single pit, gas fired and with regenerative checkerwork. After about four hours the crucibles were drawn, skimmed and poured; the ingots were stripped and reheated before getting cold. European melting mixtures, the *Stevens Indicator* notes, consisted of low-carbon Bessemer steel, wrought iron, cast iron, chrome-iron ore and limestone.

The entire absence of chemical analyses in the pages of Woodward's "History of the St. Louis Bridge" is sufficient evidence that steel was steel to the trade in 1870. Finished steel was doubtless classified and graded by fracture; raw materials were selected in a similar manner and combined by rule of thumb in what experience had taught would make a satisfactory product.

To return from this digression: Manifold troubles with bolts and staves had brought the Butcher Steel Works near to bankruptcy. Mr. Butcher resigned, the Midvale Steel Works succeeded to the business, and W. F. Durfee became superintendent. Woodward's history says "A new foreman was employed in the forging shop, and a skillful metallurgist in England was at once sent for to take charge of the melting and mixing of the steel. From this time forward no serious difficulties were met in the manufacture or testing of the staves." Such great uniformity was attained under test that soon only one in three, and later one in ten staves, were given proof loads. Small specimens were continually tested, however, and the modulus kept close to 27,000,000 and ultimate strength in tension seldom below 120,000 lb. per sq. in. It is too bad that the name of this "skillful metallurgist" was not recorded.

Further troubles were encountered of a mechanical nature, due to the hardness of the high-carbon chromium steel. The rolled stave had a fin or ragged edge (evidently metal forced into the roll clearances) which was "much the hardest part," because it was chilled so quickly. Only nine staves per day could be cleaned up on a planer. Two men could chip the fin off five or six in a day. Later a shear was installed at the hot bed and the fin trimmed off the hot bar immediately after the finishing pass.

The Keystone Bridge Co. found as much trouble when turning the required grooves in the ends of the assembled tube as the inspectors found the previous year in drilling them. In order to reduce this machining difficulty and also to avoid brittle steel, the required proof test had been reduced from 60,000 to 50,000 lb. per sq. in. (an action, strange as it may seem, interpreted by the Keystone Bridge Co. as being sufficient grounds for cancellation of the main contract for fabrication and erection). Altogether, chromium steel put quite a strain on a bridge company used to working wrought iron only! To them, when the contract was signed, "this was only one more bridge."

It was planned to make the envelopes (Fig. 2) of chromium steel also. But the first alloy ingots sent to mills which could roll plates 5 ft. wide left a trail of broken rolls and produced hard plates entirely too brittle to be formed into tubes. Consequently the plan was abandoned, and these plates were made and rolled of plain crucible steel by Park Brothers & Co. of Pittsburgh (now a part of the Crucible Steel Co. of America), to a specification calling for a 40,000 lb. per sq. in. elastic limit and 80,000 lb. ultimate strength. This sub-contract appeared to be unique in the bridge's history—apparently the Park works had no difficulty in furnishing satisfactory metal at the required rate.

Failure to Make Sound Chromium Steel in Open Hearth

After such difficulties it would not be anticipated that such an inconspicuous detail as the couplings between arch segments would be especially troublesome. In the completed bridge only a few of them ever take any loads; in fact, in the original design they were to be made of cast iron. But since those in the upper arches were to work in tension during erection, the Keystone Bridge Co. insisted that they should be made of steel and designed for a factor of safety of 12. This turned some of them into a highly stressed detail.

As seen in Fig. 4, they are split sleeves, grooved on the inside to fit accurately into other grooves cut on the ends of the tubes. Finished weights varied from 365 to 500 lb. each, and it was planned to roll them flat in six passes, cut the shape to length, reheat the piece and then press it into a semi-cylindrical form. Such practice required a slab-like ingot, and put only a moderate amount of work into the metal. Nevertheless, owing to the width of the bar and its hardness, rolls were broken frequently. Improper roll diameters caused the bars to curl upward or downward. When bars of proper shape finally were produced, a large proportion cracked under the bending press. Nine couplings (out of 1012 required) were finally produced by July 26, 1872, from work which started Nov. 25, 1871!

In an effort to improve this performance a milder steel was tried—also all manner of changes in the ingot, to avoid the surface cracks. Finally the problem seemed to be solved by a "corrugated" ingot the full width of the completed bar, as shown in Fig. 5. It was cast in dry sand molds, shaken out after two days' cooling and rolled without hammering. One half-coupling was made per ingot in this manner, nearly all of them of fair surface appearance.

Spurred on to win a \$30,000 bonus offered for delivery

of 60 couplings per week, this rate was attained by the end of 1872 and by the following February about 600 pairs were accepted as worthy of finishing and test.

When the grooves were cut in these couplings, however, considerable unsound metal was revealed, and it became obvious that a proof load must be given to each pair. Strangely enough, of the 104 made from steel cast in iron molds, 100 passed, despite the inferior surface appearance as rolled, whereas so many of those rolled from sand cast slabs and having a perfect surface failed under test, that rolled steel for couplings was abandoned after 28 months of effort to make acceptable metal.

Since erection of the steel was being held up, it was necessary to adopt some other material immediately. The Keystone Bridge Co. had meanwhile developed great concern about the strength of the couplings, threatening to abandon responsibility for safe erection unless the utmost of quality was furnished. The problem was finally solved by placing all steel couplings in the lower arches, where they would be under little or no stress either during erection or during use, and installing forged wrought iron couplings on the upper arches.

It was a great mystery why chromium steel, which saved the day for the staves, failed so miserably in the couplings. The latter metal proved unusually weak and brittle, espe-

cially when cast in dry sand molds. The metallurgist gave every assurance that the composition was unchanged, but ten test pieces cut from the last lot of completed couplings broke at 45,000 to 87,000 lb. The average was 60,000 instead of 115,000 lb. per sq. in. as in the staves. Earlier tests indicated that pressing the flat shape into a round coupling caused some damage. Tests from unbent shapes averaged 82,500 lb. per sq. in. ultimate strength; after bending 64,900.

An inference about what may have been wrong may be drawn from this remark from Woodward's history: "The open-hearth furnace, from which five tons of ingots were to be cast at one charge, went down for general repairs." Evidently the crucible process, used for the stove ingots, had given way to the open hearth. Since furnaces of the latter design had been but recently installed, it is fair to suppose that inexperience in its operation was the cause of much of the trouble. Probably little of the chromium in the ore charged into the furnace (or the chromium alloyed in the scrap) came out in the steel except as harmful oxide inclusions; the ingot practice was just right for excessively large primary crystals; and lastly, rolling without side reduction undoubtedly induced great transverse brittleness in exactly the right direction to cause the most damage in the final curving press.

Hydraulic Method of Cleaning Castings

CLEANING castings by water under pressure directed from nozzles was described at the meeting of the New England Foundrymen's Association at Boston, Sept. 12, by James Prendergast, foundry superintendent, and H. A. Lincoln, works manager, of the Sullivan Machinery Corporation, at Claremont, N. H. Mr. Prendergast said in part:

"The layout of our plant, with river running alongside and a basement under the cleaning room, lent itself perfectly to the installation of a hydraulic process of cleaning castings. We installed the equipment in the basement under the floor of the cleaning room. We lower the castings down into this room through a hole in the floor. The floor of the hydro-blast room is raised high enough from the basement floor to allow the water, after use, to drop 12 ft. and flow back into the river.

"We took advantage of the distance the water dropped to wash the fine burnt sand. It is possible for us to reclaim the clean sand. The agitation of the water accomplishes this without the use of mechanical aid. By a simple arrangement the water and sand cleaned from castings rushes through a hole in the floor through a screen which catches rods, nails and large pieces of core, then through a trough arranged to reduce the speed of the water flow. Agitation is arranged for to cause the fine burnt sand to separate easily as it passes down to a finer screen. This second screen of 50 mesh holds the sand we wish to reclaim.

"As the sand to be reclaimed accumulates, it is forced by the flow of water through a small slot into a space divided in the center to direct this sand to two spouts directly above dump buckets. These buckets have numerous screened holes to allow the water to escape. The unclaimed sand with water is discharged into the river.

"The sand in the dump buckets is allowed to stand over night, and is used the next day in facing sand for side floor, bench and machine molding. No new sand is used with the reclaimed, but simply an addition of ordinary fire clay and the regulation amount of sea coal. The mixture is worked up in the usual manner. Sand costs \$6 a ton, delivered Claremont, consequently the saving is worth while."

Cores running in size up to 9 x 18 x 66 in. are cleaned out by this method. The flow of water in the process of cleaning castings is delivered at 300 lb. pressure through common fire hose with $\frac{3}{4}$ -in. nozzles. The only cost involved in

operating the cleaning outfit is that of running a 100-hp. motor on the pump.

This method of cleaning castings has relieved the company of the hardest labor problem it had to contend with. The labor turnover on the old method of cleaning castings was very high, but now it is practically eliminated. Accidents due to flying fins and sand are done away with. Uncleaned castings and large sand piles, due to the inability to secure men to do the work, causing congestion on the cleaning floor and delayed deliveries, are a thing of the past. Cores are cleaned more thoroughly than ever before, said Mr. Prendergast, and consequently the machine shop is relieved of a lot of unnecessary work. The hydro-blast, however, does not do away with sand blast, but it does lighten the task of the sand blast operator. One operator takes care of all the work, making a saving of five men. The power cost is approximately \$2.50 per day, and the saving of sand is 17 tons per month. Best of all, the speaker added, working conditions are satisfactory.

Mr. Lincoln went into more detail as to savings in operating costs and costs of installation of the hydro-blast equipment. He pointed out that the installation of such a system in foundries not having a river handy or low city or town water rates is out of the question, but added that, where an installation can be made, it is the most practical method of cleaning castings.

Study of the mutual position of atoms in solid substances and chemical compounds, using the X-ray method, began in 1912. During that year there were six contributions to learned societies by the pioneers, W. H. and W. L. Bragg, Laue, and Stark. It has proved, however, such an attractive field of investigation for physicists that up to the end of 1927 no less than 1800 different articles have been published giving data on crystal structure and the means for studying it. Much of the work has had to do with pure metals and alloy systems. The articles are listed in a "Bibliography of Crystal Structure," by Jared K. Morse, published by University of Chicago Press, Chicago. The book also contains a statement of the methods used by the University of Chicago laboratory, and some of the results of investigations at that place.

Machinery Markets and News of the Works

Machine Tool Sales Rise

Average for June, July and August the Highest Since
First Half of 1920—Present Demand Fair

MACHINE tool business in the past week has held fairly close to the average of recent weeks. The volume of inquiries gives the trade confidence that the total for September will equal, if it does not exceed, that of August. Orders of outstanding size are exceptional, but the total of single tool requirements is fairly large.

The National Machine Tool Builders' Association reports that the average for June, July and August was the largest for any similar period since the first half of 1920, when the post-war boom was on the down grade. With 100 representing average shipments in 1922, 1923 and 1924, the June-July-August period registered a total of 220 points, or an increase of 12 points over the preceding three months' period. The peak of the post-war boom demand was 405 points on the association's scale.

"Machine tool orders seem to have been more plentiful in August than they were in July," the association's report says. "In fact, the August

figure, taken by itself, is higher than any figure we have had for any single month since the post-war boom. Since figures for the post-war boom must have included considerably more export business than is included in our latest figures, it looks as though domestic business can be fairly considered as being quite satisfactory.

"It is doubtful whether every company in the industry shared in the same proportion that it shared in the post-war boom totals. Many changes in design and sales policies have taken place since the post-war boom nine years ago. These changes would necessarily affect individual results, increasing some and diminishing other individual participations."

Railroad buying appears somewhat more promising in the Chicago district. The Chicago, Burlington & Quincy has placed orders within the week, and the Chicago, Rock Island & Pacific is asking for prices on a number of machines. Several railroads that buy at St. Louis may soon state their requirements for fall and winter.

New York

NEW YORK, Sept. 18.—Machine tool sales so far this month have been about on a par with those for a like period in August, but enough business is pending to raise hopes that the volume will increase in the remaining two weeks to such an extent as to place this month ahead of August. One of the large prospective purchases is eight planers ranging in size from 30 in. to 10 ft., totaling about \$150,000 in value. Single tools predominate in the rest of the pending list, but fresh inquiries the past week were in sufficient volume to encourage expectations of a continued good business for some weeks.

Among the week's sales were an 80-in. Maag gear generator, a 48-in. carwheel borer and a 1100-lb. steam hammer by Niles-Bement-Pond Co. and nine lathes, seven deep-hole drilling machines, two rotary surface grinders, a vertical surface grinder, two jig borers, two auto-

matic centering machines, three multiple spindle drilling machines, two die sinkers, two vertical shapers and a production hand miller by Pratt & Whitney division of same company.

American Bank Note Co., 70 Broad Street, New York, manufacturer of paper goods, has awarded general contract to Cauldwell-Wingate Co., 101 Park Avenue, for extensions and improvements in factory on Barretto Street to cost \$225,000 with equipment.

American Neon Light Corporation, 549 West 132nd Street, New York, manufacturer of tube lighting equipment for display, is planning purchase of plant property to provide for five times present capacity. A capital stock issue of 100,000 shares is being sold, entire proceeds to be used for project. Otto B. Shulhof is president; and Paul F. LeBrun, chief engineer.

William A. Veechio, 161 West Second Street, Mount Vernon, N. Y., and associates are planning construction of three-story ice-manufacturing and cold storage plant, 100 x 150 ft., to cost approximately

\$250,000 with machinery. Company will be organized to carry out project.

Takamine Corporation, 208 Rawson Avenue, Long Island City, manufacturer of electric controls and kindred equipment, has leased additional space, totaling about 20,000 sq. ft., for expansion.

Marion Reid Garage & Gas Station, Inc., 391 Fulton Street, Brooklyn, is having plans drawn for new two-story service, repair and garage building to cost about \$100,000 with equipment. Kleinert & Klie, 250 Park Avenue, New York, are architects.

Ovens, power equipment, conveying and other machinery will be installed in two-story plant to be constructed by Dugan Brothers, Inc., 228 South Fifth Street, Brooklyn, at Queens Village, L. I., to cost about \$500,000, for which general contract has been let to Willcox Construction Co., Inc., 1 Bridge Plaza, Long Island City. Henry Holder, 242 Franklin Avenue, Brooklyn, is architect.

Montgomery Ward & Co., Chicago Avenue and Larrimore Street, Chicago, have purchased 23 acres at Albany, N. Y., as site for new storage and distributing plant, to cost more than \$500,000 with equipment.

New York, New Haven & Hartford Railroad Co., Grand Central Terminal, New York, has awarded general contract to H. Wales Lines Co., 130 State Street, Meriden, Conn., for new engine house, with repair facilities, at Maybrook, N. Y., to cost over \$40,000 including equipment.

Bark & Djorup, Inc., 1351 Broadway, New York, architects, have plans for a two-story automobile service, repair and garage building, to cost \$125,000 with equipment.

Board of Education, Park Avenue and Fifty-ninth Street, New York, has authorized appropriations of \$197,035 and \$103,155, for purchase of mechanical equipment in public schools Nos. 227 and 200, at Brooklyn.

Officials of Anchor Cap & Closure Corporation, 22 Queens Street, Long Island City, are organizing Anchor Cap Corporation to take over and consolidate present concern and other companies specializing in manufacture of metal caps and affiliated products, including Paragon Can & Cap Co., Paterson, N. J.; Sure Seal Co., Beacon Machinery Corporation, Automatic Screw Capping Machine Corporation, Pilgrim Auto Supply Co., and Capstan Glass Co., New York, as well as Anchor Cap & Closure Corporation of Canada, Ltd. New company plans expansion, including vacuum and friction cover caps, screw thread caps, rubber jar rings, gaskets, etc.

Public Service Electric & Gas Co., Public Service Terminal, Newark, has plans for a two-story equipment storage and distributing plant, with repair department, at Jersey City, N. J., to cost about \$200,000 with equipment.

Texas Co., 17 Battery Place, New York, has plans for a new oil storage and dis-

The Crane Market

INQUIRY for overhead and locomotive cranes continues small. Interest in overhead equipment, although limited to inquiries for cranes of small capacity, is fairly steady. There is a moderate volume of inquiry for small capacity locomotive cranes, such as crawl-tread and truck type, but contractors are inactive and have but little locomotive crane business in prospect from new contracts.

Among recent purchases are:

General Motors Export Co., New York, two 5-ton, electric cranes for shipment to South America from Cleveland Crane & Engineering Co.

F. H. Crawford Co., 30 Church Street, New York, 25-ton used Industrial locomotive crane from unnamed seller.

Republic Iron & Steel Co., Warren, Ohio, 2-ton, single I-beam electric crane from H. D. Conkey & Co.

Dow Chemical Co., Midland, Mich., 8-ton, single I-beam hand power crane from H. D. Conkey & Co.

New Haven Copper Co., Seymour, Conn., two 5-ton hand power cranes from H. D. Conkey & Co.

Fisher Body Corporation, Pontiac, Mich., 5-ton, 2-motor, overhead crane from H. D. Conkey & Co.

International Paper Co., Corinth, N. Y., 2-ton hand power crane from H. D. Conkey & Co.

Vermont Marble Co., Proctor, Vt., 2-ton, single I-beam, electric crane for Cleveland from H. D. Conkey & Co.

Truscon Steel Co., Youngstown, 1-ton, single I-beam, electric crane from H. D. Conkey & Co.

Chevrolet Motor Co., Detroit, 22-ton, 8-wheel, steam-operated locomotive crane from Orton Crane & Shovel Co.

The Alliance Machine Co., Alliance, Ohio, reports the following recent crane awards:

165-ton ladle crane, 5-ton open-hearth charger and 7½-ton soaking pit crane, Timken Roller Bearing Co., Canton, Ohio.

5-ton standard crane, Wilkoff Co., Youngstown.

5-ton standard crane, Heppenstall Forge & Knife Co., Pittsburgh.

15-ton magnet crane, Interstate Iron & Steel Co., Chicago.

60-ton standard crane, 50-ton standard crane, two 25-ton double hook, magnet, 25-ton magnet crane and 25-ton magnet trolley, Wheeling Steel Corporation, Wheeling, W. Va.

175-ton ladle crane, and 5-ton soaking pit crane, Ford Motor Co., Detroit.

Five 2½-ton double trolley cranes, Electric Pig Iron Corporation.

60-ton ladle crane, Bethlehem Steel Co.

15-ton standard crane, Laclede Steel Co.

75-ton ladle trolley, Standard Steel Works, Burnham, Pa.

15-ton double drum crane and 5-ton open-hearth charger, Ford Motor Co., Detroit.

Five 5-ton double trolley cranes, Carnegie Steel Co., Pittsburgh.

10-ton gantry crane, American Rolling Mill Co., Middletown, Ohio.

5-ton standard magnet, Tennessee Coal, Iron & Railroad Co., Ensley, Ala.

10-ton special crane, 35-ton standard crane, and 20-ton magnet trolley, Timken Roller Bearing Co., Canton, Ohio.

20-ton magnet crane, American Steel & Wire Co., Donora, Pa.

3-ton standard crane and 25-ton trolley, Pittsburgh Plate Glass Co., Pittsburgh.

5-ton standard crane, Transue-Williams Steel Forgings Corporation.

tributing plant at Little Ferry, N. J., to cost about \$100,000 with equipment.

Franklin Lightning Rod Co., 1101 Firemen's Building, Newark, has been organized to manufacture and install lightning rods. Company purchases copper, bronze and lead from cable and rod manufacturers and does assembling on job.

Goethal Steel Co., Inc., with shop at 229 Butler Street, Elizabeth, N. J., has been organized to fabricate and erect structural steel and ornamental iron.

New England

BOSTON, Sept. 17.—The machine tool market continues quiet, although business the past week was better than in the week previous. One local house expects to close immediately on some good orders in western Massachusetts, and other dealers have a number of tools under negotiation. Most of the week's business was in Connecticut, and included shapers, lathes, jig borers, for the most part Pratt & Whitney tools, drilling and milling machines and presses. Some good sales are understood to have been made in Bridgeport, but details are lacking.

Used tools are moving slowly. Recent orders include a 3-ft. radial drill, a turret lathe equal to No. 4 Warner & Swasey, tool-room lathe, engine lathe, small drilling tools and presses. Small tools continue to move in volume. Sales so far this month are slightly ahead of those for the first half of August.

Conveyors, pneumatic tubes and other equipment are required for a three-story, 91 x 159 ft. mail and baggage unit for Boston & Maine Railroad, Boston. Densmore, Le Clear & Robbins, 31 St. James Avenue, Boston, are engineers.

Winsted Insulated Wire Co., Winsted, Conn., is having plans prepared for additional manufacturing space.

Work has started on a two-story and basement, 60 x 98 ft., addition for Continental Wood Screw Co., Mount Pleasant Street, New Bedford, Mass. Leary & Walker, Union Street, are architects.

Plans have been completed for a \$1,000,000 cement making plant at Pownal, Vt., for Commonwealth Portland Cement Corporation. L. L. Griffiths, room 1011, 58 Pine Street, New York, is president.

National Packaging Machine Co., Newtonville, Mass., has started work on a four-story addition.

Motors and conveying equipment are required for a plant for *New Haven Register*, New Haven, Conn., bids for which closed Sept. 15. Lockwood, Greene & Co., 100 East Forty-second Street, New York, are engineers.

Connecticut Light & Power Co., Hartford, Conn., has awarded general contract to United Engineers & Constructors, Inc., 1401 Arch Street, Philadelphia, for a one and two-story equipment storage and distributing plant at Norwalk, Conn., with service and repair department, to cost about \$150,000 with equipment.

Saco-Lowell Shops, 147 Milk Street, Boston, manufacturer of textile mill equipment, is planning to concentrate majority of production at Biddeford, Me., and has applied for permission to close Gooch Street to provide for erection of foundry and other units to present plant, to cost more than \$85,000. Company recently removed a portion of plant at Lowell, Mass., to Biddeford. Works at Newton Upper Falls, Mass., will be continued as heretofore.

Columbia Phonograph Co., Bridgeport, Conn., has contracted with Kolster Radio Corporation, 200 Mount Pleasant Avenue, Newark, N. J., for manufacture and distribution of equipment for joint service. Bridgeport plant will be arranged to produce two new products, comprising radio sets and Columbia-Kolster electric vibrational phonograph, including parts and assembling.

Dennison Mfg. Co., Framingham, Mass.,

manufacturer of paper goods, cardboard tags, etc., has leased property at Chicago for branch plant, primarily for tag and other heavy stock manufacture. Machinery will be installed at once, to provide for operations in October. W. F. Wentworth, manager of tag division, is in charge.

Hood Rubber Products Co., Watertown, Mass., manufacturer of automobile tires, etc., has leased property at Hartford, Conn., and will remodel for factory branch and distributing plant.

Nash Engineering Co., Wilson Point Road, South Norwalk, Conn., manufacturer of pumping machinery, compressors, etc., has plans for a two-story addition, 69 x 80 ft., to cost about \$40,000 with equipment.

Atlas Mfg. Co., Water and Warren Streets, New Haven, Conn., manufacturer of sheet metal goods and wire products, is said to be planning to rebuild part of plant destroyed by fire Sept. 13, with loss reported more than \$40,000 with equipment.

South Atlantic

BALTIMORE, Sept. 17.—Plans have been authorized by Consolidated Gas, Electric Light & Power Co., Lexington Building, Baltimore, for extensions and improvements in plant of Terminal Freezing & Heating Co., South Eutaw Street, recently acquired, including installation of boilers, forced-feed blast fans, pumps, tanks, etc., to increase capacity about 50 per cent, and to cost about \$500,000.

Officials of Crown Cork & Seal Co., 1511 Guilford Avenue, Baltimore, manufacturer of metal bottle caps, bottle capping machinery, etc., have formed Crown Cork International Corporation, capitalized at 600,000 shares stock, no par value, to operate in foreign countries. Company is arranging for plants in Europe and will also purchase existing properties.

Charles E. McManus, president, will occupy similar position with subsidiary.

Hermitage Ice & Storage Co., Inc., Hermitage Road, Richmond, Va., is planning new ice-manufacturing and cold storage plant addition, to cost more than \$80,000 with machinery. Another plant is also being considered in East End district to cost about like sum.

Board of Education, Atlanta, Ga., will soon begin work on addition to commercial high school, with additional manual training facilities, to cost over \$135,000. G. Lloyd Preacher & Co., Wynne-Claughton Building, are architects.

Lerio Patent Cup Co., 201 South Royal Street, Mobile, Ala., manufacturer of metal cups, is planning establishment of branch plant at Savannah, Ga. Portion of equipment will be shipped from Mobile to new factory site.

Printing Roller Mfg. Co., Greensboro, N. C., has plans for extensions and improvements in plant, with installation of additional equipment.

Feldspar Milling Co., Inc., Burnsville, N. C., recently organized, has work under way on new feldspar grinding mill at Bowditch, N. C., with daily output of 75 tons of finished material. It is proposed to install a third unit later. C. P. Rogers, Tryon, N. C., is president; Rudolph Glatly is manager, in charge of construction.

Union Carbide & Carbon Corporation, 30 East Forty-second Street, New York, is planning construction of new metallurgical plant in vicinity of Boncar, Va., to cost approximately \$5,000,000 with machinery. Project will be carried out in connection with hydroelectric power development of New Kanawha Power Co., a subsidiary, Glen Ferris, W. Va., and office of parent company. Site has been secured near Hawks Nest on New River, and plans are in progress for initial station, to cost more than \$10,000,000 with transmission lines. Power development will furnish service for metallurgical plant.

Board of Trustees, Fort Valley High and Industrial School for Negroes, Fort Valley, Ga., plans early call for bids on general contract for new four-story and basement school, to cost about \$135,000 with equipment. Ludlow & Peabody, 101 Park Avenue, New York, are architects. Robert S. Fiske, Healey Building, Atlanta, Ga., is consulting engineer.

Pittsburgh

PITTSBURGH, Sept. 17.—Actual sales of machine tools again in the past week have been few, but inquiries continue numerous and the trade still inclines toward a cheerful view of prospects. The Carnegie Steel Co., which is building a new warehouse on the site of its McCutcheon mills, Pittsburgh, may possibly buy a compressor, but will supply most of the other machine tool requirements of the new warehouse fabricating department from the old warehouse and its other plants. The fourth quarter tool list of the Westinghouse Electric & Mfg. Co. has not been issued yet. This company has bought most of the tools in its third quarter list on which it asked prices.

Board of Education, Duquesne, Pa., is planning installation of manual training equipment in three-story addition to high school to cost more than \$175,000, for which plans are being completed by

Carlisle & Sharrer, Martin Building, Pittsburgh, architects.

Highland Glass Co., Washington, Pa., manufacturer of wire glass and ribbed glass products has consolidated with Western Glass Co., Streator, Ill., manufacturer of similar products with branch plants at Shirley, Ind., and Fullerton, Cal. New company will be known as Highland-Western Glass Co., capitalized at \$5,000,000. Larger output is planned.

United States Engineers Office, Pittsburgh, will receive bids until Oct. 8 for one upper fabricated gate of two leaves and one lower fabricated gate of two leaves for 56-ft. lock, and two similar fabricated steel gates for 110-ft. lock at Deadmans Island, Ohio River.

Buffalo

BUFFALO, Sept. 17.—Bids will be asked soon by Board of Education, Genesee Building, Buffalo, for three and four-story Burgard vocational school, to cost about \$1,000,000 with equipment. Ernest Crimi, Genesee Building, is architect.

Curtiss Aeroplane & Motor Co., Kail Street, Buffalo, has taken options on about 50 acres near present plant and contemplates construction of new unit totaling close to 300,000 sq. ft. floor space, for manufacture of new radial type airplane motor for commercial aircraft, including parts department, assembling division, testing and other departments, to cost over \$650,000 with machinery. Company is expanding present plant, with installation of additional machinery for manufacture of new radial motor unit prior to completion of new plant, to cost more than \$200,000. C. M. Keys is president.

Viking Metallic Products Corporation, Windsor and Scott Streets, Jamestown, N. Y., is said to be planning one-story addition, to cost more than \$35,000 with equipment.

Smith Trailer Corporation, Syracuse, N. Y., has purchased rights for manufacture of Watson bottom dump tractor wagon, heretofore produced by Rex-Watson Corporation, Canastota, N. Y., including patterns, templates, and will continue manufacture under name of Smith trailers, with facilities for production of different models from 3 to 10-yd. capacities. Harold P. Bentley, formerly connected with Watson organization, will be production manager at Smith plant. R. Shaw Goldthwait, formerly sales manager for Watson company, will act in same capacity for Smith Trailer Corporation.

Board of directors, Emergency Hospital, 669 Main Street, Buffalo, is considering extensions and improvements in power plant at institution on Pine Street, estimated to cost close to \$90,000 with equipment. L. J. Schwab is in charge.

Detroit

DETROIT, Sept. 17.—Work will begin at once on three-story addition, 140 x 725 ft., at plant of Reo Motor Car Co., Lansing, Mich., for motor truck division, to cost about \$400,000 with equipment.

Michigan Central Railroad Co., Jackson, Mich., has approved plans for a new coaling station at Detroit, to cost about \$100,000 with conveying, loading and other equipment. A similar plant will also be built at Clarendon, Mich., to cost approximately \$25,000.

Chrysler Motor Car Co., 12200 East Jefferson Street, Detroit, is having plans drawn for a new one-story unit, 50 x 400 ft., for experimental and engineering departments, to cost about \$100,000. Smith, Hinchman & Grylls, Marquette Building, are architects.

City Council, Allegan, Mich., has disposed of bond issue of \$185,000, and will use fund for municipal hydroelectric power development on Kalamazoo River, for which plans are being completed.

Oldberg Mfg. Co., 2661 East Grand Boulevard, Detroit, manufacturer of automobile mufflers and kindred equipment, will soon take bids on general contract for one-story addition, to cost about \$30,000 with equipment. Revised plans are being completed by Christian W. Brandt, 2111 Woodward Avenue, architect.

Ovens, power equipment, conveying and other machinery will be installed in new one-story and basement plant to be erected by Boettcher Baking Co., Pleasant Ridge, Mich., to cost about \$100,000.

Charles J. Gibson, head of Gibson Refrigerator Co., Greenville, Mich., has acquired refrigerator manufacturing plant of Belding-Hall Co., Belding, Mich., at a public sale for about \$650,000, including real estate, plant and equipment, and will use for expansion. Electric division of Belding-Hall plant was not included in sale, and will be continued in operation by Brinton F. Hall, receiver.

Board of directors, General Motors Institute of Technology, Flint, Mich., has approved plans for additions of about 35,000 sq. ft. of floor space for extensions in machine shop, automotive service station, metallurgical laboratory and other departments. Additional equipment will be installed. Work is estimated to cost over \$100,000. E. T. Strong, president of Buick Motor Co., Flint, is head of board of directors. H. E. Mills, Buick company, is engineer.

Corduroy Tire Co., Grand Rapids, Mich., has filed plans for one-story addition, to cost over \$50,000 with equipment.

Work on a \$100,000 addition to foundry of Baker-Perkins Co., Saginaw, Mich., which is expected to double capacity, will be started at once.

Milwaukee

MILWAUKEE, Sept. 17.—The machine-tool trade continues optimistic, due to the volume of new business being maintained. At most shops bookings offset deliveries, and inquiry indicates a busy fall and winter. While the automotive industries are probably the most active purchasers and prospective customers, business sources cover a wide range of lines of production.

Hamilton Mfg. Co., Two Rivers, Wis., manufacturer of metal and wood fixtures and furniture, has established a Pacific Coast branch factory at Los Angeles, to be ready Oct. 1. Buildings have been acquired and equipment is being installed. An investment of more than \$400,000 is contemplated. Frank Krecjie will be general manager, and Dewey Berger, general superintendent.

In addition to a five-story manufacturing wing, 100 x 386 ft., on which work will begin this week, Seaman Body Corporation, 1732 Richards Street, Milwaukee, has broken ground for an extension, 40 x 80 ft., to its steam generating plant. Contract for boiler equipment has been placed with Wickes Boiler Co., Saginaw, Mich.; automatic stokers, Combustion Engineering Co., Chicago; soot blowers,

W. Clasman Co., Milwaukee; force draft fans, Clarage Co., Kalamazoo, Mich.

Kewaskum Aluminum Co., Kewaskum, Wis., producer of aluminum utensils, novelties and other drawn ware, is about to place contracts for a one-story manufacturing and storage addition, 30 x 200 ft.

Sivyer Steel Casting Co., Milwaukee, is making improvements in its plant at Thirty-seventh Avenue and Mitchell Street, West Milwaukee, including erection and equipment of a new power house, 70 ft. sq., and a brick and steel foundry addition, 48 x 52 ft.

H. O. Eiken, director Board of Vocational Education, Green Bay, Wis., is taking bids until Oct. 1 for general construction of a three-story vocational institute, 120 x 150 ft., designed by Foeller, Schoeber & Berners, architects, Green Bay. It will cost about \$350,000 complete.

Wisconsin Public Service Co., 559 Marshall Street, Milwaukee, will replace its present gas producer plant in Sheboygan, Wis., on a new site in Lyman's addition, commencing work Nov. 1 for completion prior to Jan. 1, 1930. Estimates of cost are not given. A. F. Davey is district manager. C. C. Smith is president and general manager.

G. E. Wiley, architect for Milwaukee Board of School Directors, 1011 Highland Avenue, will draw plans for a three-story addition to Milwaukee Boys' Technical High School, 345 Virginia Street, to cost about \$400,000. It is planned to place contracts and begin work before close of this year. Frank M. Harbach is secretary and business manager.

Tobin Tool & Die Co., Fond du Lac, Wis., is inquiring for a planer, boring mill and other items for an addition, 50 x 52 ft., to be ready Oct. 1.

Board of Education, Prairie du Sac, Wis., has engaged Law, Law & Potter, architects, Madison, Wis., to design a \$50,000 manual training and domestic science addition to high school. Work will begin about Oct. 15. William Schultz is secretary of board.

Keller Tool & Machine Works, 601 Jefferson Street, Eau Claire, Wis., founder and machinist, has acquired building at 123 South River Street for factory branch.

Cleveland

CLEVELAND, Sept. 17.—Machine tool business was moderate the past week. Orders placed in this territory came mainly from automobile parts manufacturers most of whose plants are operating close to capacity. Some activity is reported in Detroit in small lots of machines. A fair amount of business is in prospect in single machines. Turret lathes continue active, although sales during the first half of September were not quite up to the first half of August, when orders were unusually good. The Steel Improvement & Forge Co., Cleveland, which recently moved into a new plant, purchased a die sinker the past week.

Toledo Scale Co., Toledo, Ohio, is enlarging its plant by addition of 50,000 sq. ft. of floor space, for assembly purposes in its industrial scale department.

B. F. Goodrich Co., Akron, Ohio, has awarded general contract to Carmichael Construction Co., Akron, for nine-story addition, 148 x 260 ft., to be used in part for storage and distributing, to cost \$1,200,000 with equipment.

Barr Rubber Products Co., Sandusky,

Ohio, is considering rebuilding part of mill destroyed by fire Sept. 6, with loss in excess of \$200,000 including machinery.

Saxon Stamping Co., Toledo, Ohio, has removed its headquarters to 375 Phillips Avenue.

Timken Roller Bearing Co. has taken bids on general contract for three-story addition, 40 x 100 ft., to be used in part for metallurgical and chemical laboratory, to cost about \$60,000 with equipment. R. T. Campbell and R. A. Zenk, 144 West Wood Street, Youngstown, Ohio, are architects.

Philadelphia

PHILADELPHIA, Sept. 17.—Universal Service Motors Co., Broad and Pine Streets, Philadelphia, has leased property at 1817-19 Market Street and plans construction of new multi-story service, repair and garage building, to cost over \$150,000 with equipment.

Department of Public Works, Philadelphia, Alexander Murdoch, director, will make improvements in municipal airport at Island Road and Tinicum Avenue to cost about \$25,000. Plans are being projected by city, under direction of Mayor Mackey, for purchase of land and construction of new airport, including hangars, repair and reconditioning shops and other units, entire project to cost close to \$1,000,000. Ludington-Philadelphia Flying Service, care of Airport Equipment Division, Pennsylvania Building, has plans for a new hangar with repair facilities at present airport, to cost close to \$30,000.

Philadelphia Paper Mfg. Co., Water and Wolfe Streets, Philadelphia, is carrying out an expansion program at its mills, including installation of additional equipment for manufacture of hardened fibre board containers and kindred products.

United States Gypsum Co., 300 West Adams Street, Philadelphia, is reported planning construction of new mill at Philadelphia for manufacture of gypsum building products, including wallboard, tile, etc., to cost more than \$350,000 with machinery. Engineering department of company is in charge.

Firestone Tire & Rubber Co., Akron, Ohio, is reported planning new multi-story factory branch and distributing plant at Wilmington, Del., to cost more than \$100,000 with equipment.

City Commission, Camden, N. J., has authorized an appropriation of \$300,000 for new junior high school, with manual training facilities, for which plans will soon be completed. Board of Education is in charge.

Leon H. Brendlinger, Robert J. Best and Joseph F. Schneider, all of Mount Carmel, Pa., have organized Ornamental Iron Works, with capital of \$20,000, and plan early operation of local plant for production of ornamental, architectural and structural iron specialties, as well as brass and bronze goods. Mr. Brendlinger will be treasurer.

Hudson Coal Co., Scranton, Pa., is planning extensions and improvements in its Marvine coal breaker, near Carbon-dale, Pa., including installation of new equipment, to cost about \$175,000.

A company whose name is temporarily withheld has leased former plant of Wesel Co., Scranton, Pa., and will remodel for new works to manufacture aircraft motors, including parts and assembling departments. Scranton Chamber of Commerce has carried out negotiations for new plant and is interested in project. Production is scheduled to begin by close of year.

Penn-Jersey Steel Co., 1450 Ferry Avenue, Camden, N. J., will equip one-story addition, 65 x 166 ft., generally for storage and distributing, and will install crane runway, cutting, drilling, punching and other equipment. Arnold H. Moses, Camden, is architect.

Hobson, Flatware Co., Lansdale, Pa., manufacturer of chromium and nickel plated ware, is said to be planning construction of new plant at Lambertville, N. J., to cost more than \$75,000 with equipment. It is purposed to remove present plant to new location and increase capacity. Lambertville Chamber of Commerce is interested in project.

Queen City Aircraft & Airways Co., Allentown, Pa., is being organized by local interests, headed by Arthur R. Wieand, and plans early operations. An airport will be established at Wescoesville, near Allentown, with hangars, repair and reconditioning shops, and other units. Company will manufacture aircraft, it is said, at later date.

Chicago

CHICAGO, Sept. 17.—Purchases of machine tools in the first half of September were equal to the total for the first two weeks in August. Inquiry, both old and new, gives dealers confidence that early fall business will be well up to the summer rate. Of special interest is the increased activity by railroads. Inquiries for used tools are fairly numerous and sales bring good prices.

The Rock Island is asking for prices on a rod grinder, two emery grinders, a gate shear, beam punch, bevel rotary shear, 36-in. drill press, horizontal punch and an 18-in. lathe, all motor driven. The Chicago & North Western will purchase a 32-in. shaper and the Chicago, Burlington & Quincy has placed orders the past week. Several railroads that purchase at St. Louis may make known soon their fall and early winter requirements.

Peoples Gas Light & Coke Co., 122 South Michigan Avenue, Chicago, will build a two-story compressor house, 47 x 80 ft., to cost \$40,000. R. Schwend, 122 South Michigan Avenue is architect.

Interstate Rivet Co., Chicago, has leased a one-story building containing 20,000 sq. ft. of floor space, at 6600 South Oak Park Avenue, for expansion.

Contract has been let by Wilson Steel Products Co., 4840 South Western Avenue, Chicago, to Nolan-Burke Co., 5 North La Salle Street, for one-story addition, 93 x 100 ft., to cost about \$25,000. Fred A. Fielder, 118 East Twenty-sixth Street, is architect.

Ray Brown & Co., 743 Twentieth Street, Rockford, Ill., manufacturers of mechanical equipment, are planning erection of one-story machine shop, to cost about \$24,000 with equipment.

Board of Education, South St. Paul, Minn., is considering installation of manual training equipment in two-story addition to high school, to cost about \$150,000, for which bids will be asked on general contract early in October. Toltz, King & Day, Builders' Exchange Building, St. Paul, are architects.

Adams Sheet Metal Works, Mason City, Iowa, will move from 17 Second Street, S. W., to 2402 South Federal Avenue, where additional facilities will be provided for larger output.

Caterpillar Tractor Co., Washington Street, East Peoria, Ill., is said to be planning one-story and basement addi-

tion, to cost over \$100,000 with equipment. Company is completing work on one-story extension, 160 x 612 ft., costing more than \$200,000.

Board of Education, City Hall, Minneapolis, Minn., contemplates new vocational school to cost about \$450,000 with equipment, work to begin early next year. Bureau of Buildings, 245 Ninth Avenue North, will prepare plans.

National Sewing Machine Co., 176 North Michigan Boulevard, Chicago, has awarded general contract to Holm-Page Co., Rockford, Ill., for two-story addition to plant at Belvidere, Ill., 80 x 80 ft., to cost about \$30,000 with equipment. Peterson & Johnson, Swedish-American Bank Building, Rockford, are architects.

Baker Mfg. Co., 910 Stanford Street, Springfield, Ill., manufacturer of road-making machinery and parts, is said to be planning an addition to cost about \$40,000 with equipment.

Dahlin Brothers & Davis Mfg. Co., 515 First Avenue, N. E., Minneapolis, Minn., manufacturer of furniture, has awarded general contract to Peterson & Lang, Builders' Exchange Building, for one-story and basement factory, 70 x 230 ft., at Burlington, Iowa, to cost about \$40,000 with equipment. Lang, Raugland & Lewis, Essex Building, Minneapolis, are architects.

United States Gypsum Co., 300 West Monroe Street, Chicago, has awarded general contract to Turner Construction Co. for new mill at East Chicago, Ind., to manufacture wallboard and other specialties. Works will include power house, machine shop and auxiliary structures, to cost more than \$200,000 with machinery. J. H. Nold is company engineer.

St. Louis

ST. LOUIS, Sept. 17.—Bids will soon be asked by Brass & Copper Sales Co., 1712-14 Chestnut Street, St. Louis, for two-story storage and distributing plant, to cost about \$65,000 with equipment. Klipstein & Rathman, Security Trust Building, are architects.

Evans-Wallower Lead Co., Joplin, Mo., operating local properties formerly owned by Golden Rod Mining & Smelting Co., has plans for new electrolytic zinc plant at East St. Louis, Ill., to cost over \$850,000. Officials have organized Evans-Wallower Zinc Co., a subsidiary, to carry out project.

N. O. Nelson Mfg. Co., 928 Chestnut Street, St. Louis, manufacturer of plumbing equipment and supplies, will soon call for bids for two-story unit, to cost more than \$200,000 with machinery. P. J. Bradshaw, 718 Locust Street, is architect.

Board of Education, Excelsior Springs, Mo., is considering installation of manual training equipment in new high school to cost \$200,000, for which plans will be drawn by Saylor & Payson, Interstate Building, Kansas City, Mo., architects.

Officials of St. Louis Car Co., 800 Broadway North, St. Louis, have organized Cardinal Aircraft Co., a subsidiary, to build commercial airplanes and parts. Complete assembling works will be operated. E. B. Meissner is president of parent company.

General Tire & Rubber Co., Akron, Ohio, will take bids for three-story factory branch and distributing plant at Kansas City, Mo., to cost about \$200,000 with equipment. Greenbaum, Hardy & Schumacher, Scarritt Building, Kansas City, are architects.

East Side Levee and Sanitary District, Metropolitan Building, East St. Louis, Ill., has revised plans for two new pumping plants for municipal water system, installation to include four and two pumping units, respectively, with accessories.

City Council, Kirkwood, Mo., has engaged Black & Veatch, Mutual Building, Kansas City, Mo., consulting engineers, to prepare plans for municipal electric light and power plant, to cost about \$200,000 with machinery. Previous reference to appointment of another engineer was premature.

Heck Electric Lawn Mower Co., 1016 Baltimore Avenue, Kansas City, Mo., recently formed by H. L. Heck and associates, is planning manufacture of new type electrically-operated lawn mower, with rotary cutting blades. For time being, company will contract with outside interests for production of parts and assembling, and later will establish own plant. Mr. Heck will be president and general manager.

Bauman Auto Body & Fender Works, Great Bend, Kan., has leased building to be erected at 1908 Broadway and will use largely for machine shop and repair service.

Cincinnati

CINCINNATI, Sept. 17.—In the first half of September machine-tool sales were less than the August average, but were substantially ahead of those in the same period of 1927. There has been an almost total absence of transactions involving more than one or two machines, but this has been offset by the liberal volume of fall orders. Inquiries are fairly good, and the diversified nature of current bookings is an indication that buyers in many industrial lines are planning to replace old equipment.

Plans are under way by Union Light, Heat & Power Co., Fourth and Plum Streets, Cincinnati, for new five-story equipment storage and distributing plant, with service and repair division, to cost more than \$200,000 with equipment. Engineering department of Columbia Engineering & Management Corporation, Cincinnati, is in charge.

City Council, Cincinnati, will take bids for municipal airport at Lunken field, including 12 hangars, service and repair shops, oil storage and distributing buildings, administration building and other units. C. O. Sherrill is city manager.

Briggs Mfg. Co., 11631 Mack Avenue, Detroit, manufacturer of automobile bodies, is said to be negotiating for purchase of former plant of William J. Oliver Mfg. Co., Knoxville, Tenn., for establishment of new branch plant to manufacture automobile body accessories. Options have been secured on 9-acre tract adjoining Oliver works for expansion. Project is reported to cost more than \$250,000 with equipment.

Air Corps, Fairfield Air Depot, Dayton, Ohio, Captain Laughlin in charge, plan call for bids before end of month for one-story aircraft assembling plant to cost about \$100,000 with equipment, and for one-story aircraft machine shop and repair works to cost about \$140,000 with equipment.

Board of Education, 216 East Ninth Street, Cincinnati, plans installation of manual training equipment in new three-story and basement junior high and grade school to cost \$750,000, for which bids have been asked on general contract. C.

H. Ferber, Union Trust Building, is architect.

Mengel Body Co., Fourth and G Streets, Louisville, a subsidiary of Mengel Co., same address, has awarded general contract to Struck Construction Co., 147 North Clay Street, for one-story and basement addition, 300 x 440 ft., primarily for automobile parts production, to cost about \$1,000,000 with machinery. Company has secured large contract from Willys-Overland Co., Toledo, Ohio, and new unit will be given over to this business for several months.

Plans are being drawn by Niles Steel Products Co., Niles, Ohio, for new one-story plant, to cost over \$125,000 with equipment. J. E. Fitzgerald is president.

Indiana

INDIANAPOLIS, Sept. 17.—Delco-Remy Co., Anderson, manufacturer of automobile starting and lighting equipment, is equipping new plant unit, recently completed. Machinery will be transferred from existing buildings and additional facilities installed for increased output.

Artificial Ice & Cold Storage Co., 316 West Ohio Street, Indianapolis, is considering erection of addition to ice-manufacturing and cold storage plant, to cost more than \$70,000 with equipment.

Rushville Natural Gas Co., Rushville, will make extensions and improvements in stations and pipe lines to cost about \$30,000.

Wilbur C. Hibberd, Richmond, and associates have organized Richmond Hammered Ring Co., and will operate plant for production of piston rings and kindred specialties. Earl W. Allen, Richmond, is interested in new organization.

National Mill Supply Co., Fort Wayne, machinery and mechanical equipment, has work under way on addition to factory, including erection of two additional floors to three-story building, to cost more than \$45,000 with equipment.

Gulf States

BIRMINGHAM, Sept. 17.—Work has been started by Graham-Paige Motor Co., West Warren Street and Detroit Terminal Railroad, Detroit, on new branch mill at Perry, Fla., for manufacture of automobile and truck body accessories, to cost about \$140,000 with equipment.

City Council, Amarillo, Tex., has been authorized to expend \$100,000 for municipal airport, including hangars, repair and reconditioning shops, oil storage and other units. A 480-acre tract has been selected.

Texas Ice & Refrigerating Co., 1201 Jones Street, Fort Worth, Tex., has plans for new ice-manufacturing and cold storage plant, to cost about \$50,000 with equipment.

Humble Oil & Refining Co., Houston, Tex., is said to be planning an expansion and improvement program at its Ingleside refinery, near San Antonio, Tex., including three new stills, with auxiliary equipment, gasoline refining unit and other equipment, to cost more than \$850,000.

Standard Rock Asphalt Co., Brady Building, San Antonio, Tex., J. C. Arnold, president, is arranging for installation of equipment on limestone rock properties in Kinney and Uvalde Counties, and will purchase bucket elevator, automatic conveyors, pit machinery and quarrying apparatus, two crushers and auxiliary equipment.

Straven Coal Mining Co., American-Traders Bank Building, Birmingham, will develop coal properties in Shelby County, where about 1200 acres has been secured, and will install machinery for output of more than 150 tons per day.

Chevrolet Motor Co., 3044 West Grand Boulevard, Detroit, will proceed with erection of new branch assembling plant on Jefferson Davis Parkway, New Orleans, one story, to cost about \$150,000 with equipment. General contract has been let to Gervais F. Favrot, Balter Building, New Orleans.

A. H. Thomas Mfg. Co., Lake Worth, Fla., will rebuild its ice-manufacturing and cold storage plant at Stuart, Fla., destroyed by fire Sept. 11, with loss over \$100,000 with machinery.

Cities Service Gas Co., 60 Wall Street, New York, will make extensions and improvements in natural gas plants at Pampa, Tex., and Mooreland, Okla., including installation of additional equipment, to cost about \$80,000. New compressor station of 5000-hp. capacity will be installed at natural gas properties at Higgins, Tex., to cost close to \$100,000.

Board of Trustees, Texas Technological College, Lubbock, has work under way on new engineering building, totaling about 52,000 sq. ft. floor space, for mechanical, electrical and architectural engineering divisions, to cost \$240,000 with equipment.

X. L. Mfg. Co., Gadsden, Ala., recently organized by J. C. Greene, Gadsden, and associates, is planning establishment of new plant for enameling cast iron parts for stoves and ranges, to cost close to \$25,000 with equipment. Otto Agricola will be secretary and treasurer.

Lores Canning Co., Mobile, Ala., is planning to rebuild part of plant destroyed by fire Sept. 12, with loss close to \$100,000 including equipment.

Pacific Coast

SAN FRANCISCO, Sept. 9.—Plans are being arranged by Emsco Aero Engine Co., Los Angeles, recently organized, for new factory to manufacture aircraft motors and parts, to cost over \$45,000 with equipment. E. M. Smith is president, and W. J. Smith, secretary and treasurer. A site is being secured near municipal airport.

Board of Education, Ventura, Cal., is arranging a bond issue of \$400,000 for a new junior high school group, to include one-story vocational shop. A 14-acre tract has been purchased.

Byron Jackson Pump Mfg. Co., Huntington Park, Cal., is having plans drawn for one-story addition, 30 x 140 ft., crane runway and remodeling of present unit, 90 x 280 ft., to cost \$65,000 with equipment. Hamm, Grant & Bruner, Inc., Ferguson Building, Los Angeles, is architect.

Barde Steel Co., 2709 Utah Street, Tacoma, Wash., has purchased site on tideflats for construction of new one-story storage and distributing plant to cost about \$200,000, including two overhead bridge cranes and other handling and conveying equipment.

George L. Barnes, Centralia, Wash., has leased site and will soon begin work on one-story foundry for production of brass and bronze castings, to cost about \$30,000 with equipment.

Victor Talking Machine Co., Camden, N. J., has awarded general contract to Austin Co. of California, Los Angeles, for initial unit of Pacific Coast branch at 1016 North Sycamore Avenue, one

story, 90 x 135 ft., to cost about \$50,000 with equipment. Other buildings will be erected later.

Pacific Gas & Electric Co., 245 Market Street, San Francisco, has applied for permission for hydroelectric power development on Mokelumne River, Amador County, providing for additions to generating stations at Salt Springs and Tiger Creek, with 48,000 hp. additional capacity. Extensions will be made in steel tower transmission lines. Project will cost about \$7,000,000.

Western Electric Co., 165 Broadway, New York, and 680 Folsom Street, San Francisco, is expected to ask bids in about 30 days for new five-story telephone and radio equipment plant at Emeryville, Cal., to cost close to \$500,000 with machinery. Engineering department of company, New York, is preparing plans.

Crystal Ice & Cold Storage Co., Phoenix, Ariz., will erect five-story ice-manufacturing plant, with cold storage division, to cost \$100,000 with machinery.

Feenaughty Machinery Co., Portland, Ore., has taken over agency of Galion Iron Works & Mfg. Co., Galion, Ohio, together with other lines formerly handled by Willamette Equipment Co., Portland, which is retiring from machinery business. Feenaughty company is transferring Willamette stock to its new warehouse and Fred Kingston, formerly general manager of latter company, will become associated with Feenaughty organization as general field salesman, with offices at 324 Belmont Street.

Canada

TORONTO, Sept. 17.—While no large business developed in this market the past week, demand is steady. Single tool sales predominate, and a good volume of orders is being placed. Inquiries are coming out for equipment for new works, and several lists are being prepared. The Canadian General Electric Co. is expected in the market soon with a fairly large list for its Peterborough, Ont., plant addition. Willys-Overland, Ltd., Toronto, and the Chrysler Motor Co., Walkerville, Ont., also are interested in equipment for plant additions. Demand for tools from northern Ontario for mining operations continues a feature.

Plans have been approved for additions and improvements to Brantford and Toronto plants of Dominion Radiator & Boiler Co. An appropriation of \$500,000 has been made to carry out these improvements. Approximately 60 per cent of fund will be spent on Toronto plant, and remainder on plant at Brantford. Work will be started at once, and it is purposed to have both plants completed by end of this year.

Jones Brother of Canada, Ltd., Toronto, manufacturer of show cases, barbers' supplies, etc., has taken over plant of Walker Bin & Store Fixture Co., Ltd., Kitchener, Ont., where it will produce a large part of equipment now made in Toronto plant. Considerable new machinery will be installed.

W. B. Foshay Co., Milwaukee, has purchased power plants at Walkerton and Southampton, Ont., and will spend \$105,000 on alterations and additions. W. A. Emerson, Walkerton, Ont., is engineer.

John Evans, architect, is receiving bids for erection of an addition to plant of Dominion Tack & Nail Co., Galt, Ont., to cost \$30,000.

Fraser Brace Engineering Co., Ottawa,

Ont., has been awarded contract for a power house and dam at Nigger Rapids, Que., for Gatineau Power Co., 91 Carter Street, Ottawa, Ont.

Canadian Ingersoll-Rand Co., Ltd., Sherbrooke, Que., has awarded contract to Newton Construction Co., 165 Portland Avenue, for an addition to cost \$35,000.

Satin Finish Hardwood Flooring, Ltd., Oak Street, Weston, Ont., has started work on an addition to its plant, 72 x 256 ft., to cost \$32,000. Contracts for equipment have not yet been placed.

The Deloro Mining & Smelting Co., Deloro, Ont., will build a new refinery to cost \$100,000, to replace plant destroyed by fire Sept. 4.

Western Canada

Pacific Coast Terminals, Ltd., Twelfth Street, New Westminster, B. C., has awarded contract to Northern Construction Co., Ltd., Birks Building, Vancouver, B. C., for superstructure for cold storage plant, to cost \$900,000. It will be six stories, 150 x 700 ft.

Shell Company of California, 559 Fifth Avenue East, Vancouver, B. C., is preparing plans for an oil and gas distributing plant at Port Alberni, B. C., to cost \$50,000.

British Columbia Terminal Warehouse Co., Ltd., Victoria, B. C., will start work at once on erection of a plant to cost \$600,000.

Foreign

BIDS will be received by Bureau of Yards and Docks, Navy Department, Washington, until Oct. 10 for power equipment for naval station at Guantanamo Bay, Cuba, including two 250-kw. Diesel engine-generators, with starting equipment and exciter; motor-generator set; a. c. motors for existing centrifugal pump and air compressors, with switchboard and accessory apparatus, specification 5699.

American & Foreign Power Co., operated by Electric Bond & Share Co., 2 Rector Street, New York, is reported planning construction of hydroelectric power plant on Paraguassu River, near Bahia, Brazil, with transmission lines throughout district.

Amorg Trading Corporation, 165 Broadway, New York, official buying agency for Soviet Russian Government, has arranged for increase in capital from \$1,500,000 to \$3,000,000, to provide additional funds for purchase of equipment for Soviet industrial projects and other expansion. During coming fiscal year more than \$700,000,000 will be invested for capital construction in Soviet industries, a considerable portion of amount to be expended for mechanical equipment. S. G. Bron is chairman of board of directors.

Victorian Railways Commissioners, Melbourne, Australia, will receive bids until Oct. 10 for one beam straightening machine.

Insular Government of Bermuda, Hamilton, has authorized construction of an electrically-operated railroad, 29 miles long, to cost \$1,000,000 with equipment. Project will be carried out under Government direction by British Traction Co. It expected to complete about one-third of road this year. Power stations and line facilities will be provided.

Superintendent of Stores, Saptieh, Cairo, Egypt, will receive bids until Oct. 16 for 17,215 kilos of brass and copper wire and rods of various sizes. Information at office of chief inspecting engineer, Government of Egypt, London, England.

THE IRON AGE

New York, September 27, 1928

ESTABLISHED 1855

CARNEGIE LIBRARY OF PITTSBURGH VOL. 122 No. 13

New Alloy Steels, Machines and Methods to Be Seen at Metal Show

IT has come to be recognized that the annual show held by the American Society for Steel Treating records the achievements of the metal-making and metal-working industries generally. A visitor to the National Metal Exposition, to be held at Commercial Museum, Philadelphia, the week of Oct. 8, will be shown the latest developments in steels, alloys, testing and control equipment, heat-treating appliances, and metal-working tools. In order to help such an onlooker appraise the progress which has been made in recent months, many of the exhibitors have forwarded special information to THE IRON AGE.

This is an era when we move rapidly and are building boldly. Speed and bulk are commonplace matters. But Lindbergh could not have flown to Paris, nor could the Hudson River be spanned until an enormous amount of work had been done by metal and machine makers to produce an even flow of fine metal of utter dependability.

The demands of today, and those of only a few decades ago, are vividly contrasted in the sketch showing the relative sizes of the Brooklyn Bridge (in its day one of the wonders of the world) and the new Hudson River bridge now under construction. One firm, John A. Roebling's Sons Co., Trenton, N. J., is responsible for the cables on both these bridges. Compare the Norway iron bridge wire used

80 years ago, having an ultimate strength of 90,000 lb. per sq. in. with the high carbon acid open-hearth steel wire being made for the new mammoth structure, having an average strength of 231,000 lb. per sq. in.! This is a good measure of the improvement made in all fine steels.

Growing Demand for Special Steels

Many manufacturers of special steels report a gratifying increase in business. For instance, the Timken Roller Bearing Co., Canton, Ohio, has noticed so decided an increase in the demand for high-grade alloy steels from manufacturers of all sorts of equipment as to warrant tripling the capacity of the Timken steel plant, installing a group of electric furnaces for scientific annealing of the product, and organizing a subsidiary company—Timken Steel & Tube Co.—to handle the business. The Donner Steel Co., Inc., Buffalo, is also producing an increasing proportion of alloy steel bars. To meet the demand for more specialized qualities and finishes cold drawn bars and "die-rolled" products have been made since the first of the year, and the first electric furnace steel was produced on June 15. Similar movements have been reflected in operations at the works of the Universal Steel Co., Bridgeville, Pa. During the past year additions and improvements have been made in its electric

IMPROVEMENT in Quality of Steels in Recent Years Is Gaged by Comparing the Size of Hudson River Bridge, Now Building, With Brooklyn Bridge, for Decades the Largest of Its Kind

by Using Alloy
Steel Bearings*

melting, rolling mill and annealing departments, and two new departments for cold drawing and cold rolling were placed in full production.

Much of this expanding tonnage of high-grade steels is absorbed by the automobile industry. Some firms have secured desirable business from the manufacturers of aircraft and aircraft engines. Particularly, the Carpenter Steel Co., Reading, Pa., reports its most notable advances as being in the production of special chrome-nickel, chrome-vanadium and other steels for highly stressed airplane engine parts. This company has also produced a free cutting stainless iron by the addition of a small quantity of zirconium sulphide. The Climax Molybdenum Co., New York, is successfully promoting the use of chrome-molybdenum steel tubing for the construction of fuselage skeletons. Americans now prefer all-welded metal aircraft structures to the older wood and steel composite types, on account of added safety. Chrome-molybdenum steel is said to lend itself best to welded construction, because the heated joint air-hardens on cooling and thus regains nearly all the original strength.

Alloy Steel for Hardware Products

Important though the automotive industry undoubtedly is, as a purchaser of fine steel, a reviewer of trends in the industry must not overlook important other outlets which are only now appearing. Hardware is one of these branches which has great possibilities. Recently J. H. Williams & Co., Buffalo, have been making drop-forged and heat-treated wrenches of chrome-molybdenum steel; the product is held as setting a new standard in uniformity and reliability; and such wrenches have given a kind of service as to warrant a guarantee by the makers against breakage from any cause.

Railroads, even better customers of the steel industry than automobile plants, are also giving increasing attention to alloy steels, according to the International Nickel Co., New York. Nickel steels are now being made into main frames for locomotives, driving rods, axles, boiler and fire-box plate, seamless tubes and staybolts. Nickel-molybdenum steel has also been built into roller bearings for passenger cars by the Timken company.

Alloy Steels for the Chemical Industry

Still another major industry which is absorbing the new alloy steels in increasing amounts is the chemical industry,

including such allied lines as petroleum refining, soap making and similar processing. The Halcomb Steel Co., Syracuse, N. Y., notes a rapid development in non-corrosive and heat-resisting alloys. Construction of new plants for making nitric acid and nitrogenous fertilizers has gone forward, plants of such size and using such processes as could hardly have been constructed of glass, stoneware or noble metals, as in the past. This has required the production of alloy steels for severe service which can be rolled, forged, riveted, or welded.

At the Steel Treathers' Show held in Philadelphia in 1920, Crucible Steel Co. of America exhibited in a very small way some newly developed steels of superior corrosion- and heat-resisting properties. In the intervening years these chromium-nickel-silicon steels called Rezistal have found so many uses that the production is no longer looked upon as a specialty. At the present exhibit the company will show some large-scale pieces of equipment, made from these alloys, in this manner indicating the important advances in chemical and other apparatus made possible by a combination of metals regarded as a laboratory curiosity only ten years ago.

Merchandising problems evidently increase as the variety of products and the number of outlets multiply. The Carpenter Steel Co. (among others) is meeting this situation by a rapid extension of warehouse facilities. Horace T. Potts & Co., Philadelphia, find so many customers who require not one but a dozen types of steel, that salesmen must be competent to appraise each situation, and tender sound advice on the individual needs. Customers' demands are also becoming more stringent, as to quality, uniformity, and prompt deliveries.

Developments in Steel Making Technique

Two notable events may also be recorded in steel making technique. The Ajax Electrothermic Corporation, Trenton, N. J., notes that a high frequency induction furnace of 1-ton capacity has been installed for melting high speed steel at the Edgar Allen Steel Co.'s works in Sheffield, England, and another is being installed by Jacob Holtzer & Co., in France. The Vanadium Corporation of America, New York, has also marketed a new deoxidizer, a carbon-free alloy of aluminum, silicon and iron, so proportioned that the products of reaction form a fusible aluminum silicate, readily eliminated in the ladle. It is said that the resulting steel is entirely free from harmful aluminum oxide or aluminum

Low Carbon Nickel Steel Casting, With Gates and Risers, a Main Side Frame for Large Locomotives, Meets Severe Specifications Required by Heavier Traffic

carbide inclusions, and is more uniform in soundness, toughness and machinability.

New and improved alloys have been placed on the market in the past year, as well as new uses found for old ones. A brief review, such as this, must treat such developments in a fragmentary manner—details can best be obtained at the exhibits of the steel companies. Perhaps the latest development is that announced by the Firth-Sterling Steel Co., McKeesport, Pa.—a high-carbon high-chromium steel to be marketed under the trade name Chromovan triple die steel. Such an analysis has been known to give superior life when made into dies, but the dies have been so hard and so difficult to machine that costs of die sinking have been almost prohibitive. By improved annealing and mill inspection, Firth-Sterling has produced Chromovan with

a thin case, glass hard, is produced without quenching, and at a temperature where grain growth and distortion are avoided. Hardening by ammonia was patented some years ago by American Gas Furnace Co.

Materials for Heat-Resisting Uses

Several firms report activity in the field of heat resisting steels and alloys, largely used by steel treaters, among others, for carbonizing boxes and for automatic furnace parts. In the past the most attention has been paid to castings for such services, but the Halcomb Steel Co., Syracuse, N. Y., has been marketing metal which can be made into sheets, tubes and other rolled shapes, and suitable for fabrication into carburizing boxes and furnace muffles. Advantages claimed reside in the fact that a thinner wall, and con-

Twenty-two Tons of Fahr-alloy for Roller Hearth of One Continuous Sheet Annealing Furnace

hardness under 210 Brinell, and of an analysis which will either oil or air-harden, it is claimed, without warping and with negligible change in volume.

New Uses of Well Known Materials

As an instance of new uses for well known materials, the Kinite Corporation, Milwaukee, calls attention to hobs and cams made of the air-hardening alloy steel known as Kinite. It states that as this metal holds its shape under heavy pressure, manufacturers of Bakelite and other molded products may make molding dies by pressing a Kinite hob into low carbon steel blocks. It is offered also as easily cast into cams, and in such form is especially useful for withstanding heavy pressures as in coining presses.

An interesting change in what had long been thought to be a standardized article has been effected by Heppenstall Forge & Knife Co., Pittsburgh. Since the first sheet metal was rolled, it has been trimmed to shape by shear blades made of high grade carbon tool steel. With the recent advent of the wide strip and the continuous sheet mill, it became apparent that the old style knife could not stand up under the punishment of such heavy production. To meet this need, blades made of acid open-hearth alloy tool steel have been developed, known as Kleenkut shear knives, described as giving greatly increased service between grinds.

An innovation which has caused much discussion among heat treaters during the last year is the method of case hardening special steels by exposure to ammonia gas at 950 deg. Fahr. American rights for this process are shared by the Ludlum Steel Co., Watervliet, N. Y., and the Central Alloy Steel Corporation, Massillon, Ohio. A special steel—usually high in aluminum—is used for this process, and

sequently a more efficient heat transfer, may be made from sheet than from cast metal.

The Allegheny Steel Co., Brackenridge, Pa., has also marketed quite successfully its most recent high-nickel, high-chromium steel known as Ascoloy 44. This can be furnished in castings as well as rolled shapes, and may be welded by either the gas or electric process. Thus a wide variety of furnace parts, heat resisting equipment, recuperators and heat exchangers may be fabricated readily.

A number of cast alloys have been successfully used for carbonizing boxes and furnace parts. It seems possible to get materials of this sort at a wide range of prices, each one having individual merit for certain services. The problem of selecting the alloy which will give the greatest return per dollar expended has become so complex that the General Alloys Co., Boston, has established an industrial survey division for studying it. The division is to function in two ways. First, to study existing installations of Q-alloys (the company's principal product), and second to study the conditions in the plants of prospective users.

The Bell & Gossett Co., Chicago, and an associated organization, the Case Hardening Service Co., Cleveland, have been marketing for eight months an alloy of nickel-chromium-aluminum known as Ni-Chro-Al. It is a low priced alloy, frankly admitted to be less durable than some of the more expensive alloys, but it is said to have replaced steel or malleable carburizing boxes with resultant economies.

That a considerable amount of heat resisting alloys enters into a modern furnace is obvious from a glance at one of the accompanying illustrations, representing 22 tons of Fahr-alloy shafts and disks for a single furnace. The

Southern Manganese Steel Co., St. Louis, patentee, have, by an improved design, been able to avoid the necessity of water cooling the alloy parts, forming the roller bottoms

of sheet annealing furnaces. It is urged that this innovation saves fuel, avoids the expense of water and the cooling system, and increases the furnace output.

Developments in Furnaces and Fuel Applications for Them

H EAT treating methods and equipment form the principal interest of the American Society for Steel Treating, and naturally the majority of the visitors at the National Metal Exposition will be attracted by novelties in these lines. As an attempt was made in the early part of this review of progress to measure recent advances in metal manufacture by contrasting the size of noteworthy bridges, so will E. F. Houghton & Co., Philadelphia, emphasize the advances in heat treating by contrasting the mediæval alchemist's den with a research and control laboratory, with its electric furnace, pyrometric control, physical testing equipment, microscope and X-ray machine. It seems a far cry from the cementation furnaces used only a century ago, requiring 21 days to convert wrought iron into steel, to the modern counter-flow recuperative furnace, carrying

tady, N. Y. Such furnaces are useful for hydrogen annealing of iron sheets for electrical purposes, or for making joints by the coppering process (as was fully described in THE IRON AGE for May 10, page 1305.)

A merry battle continues between the proponents of the various heating methods. Gas, oil and electricity each have their supporters, and doubtless an engineering analysis would select one fuel for one set of circumstances, and another for different conditions. It is probably true that the manufactured gas industry has recouped far more than its lost lighting load by intensively cultivating the possibilities of industrial heating. The Peoples Gas Light & Coke Co., Chicago, notes in the last year such outstanding examples as one plant of average size increasing its gas consumption over 50 million cu. ft. a year, and making large expendi-

Continuous Strip Annealing Furnace, Built in 1899 for the Philadelphia Mint by American Gas Furnace Co., Contained Many Elements of Advanced Designs in 1928

continuous rows of pots, full of mild steel parts, packed in special carburizing compounds, each pot completing the trip in as many hours. Holcroft & Co., Detroit, record notable developments in such furnaces as last mentioned, and build them either for city gas or for electric heat.

As a matter of fact, continuous heat treating furnaces have been available for 30 years, to a date back in the "dark ages" of heat treatment—at least for the present generation. One of the accompanying illustrations was dug out of the archives of the American Gas Furnace Co., Elizabeth, N. J., and it may be observed that this 1899 furnace has the essential elements of the up-to-date through annealer. The most recent development to be reported by this organization is an active interest in vertical furnaces for carburizing in a gas atmosphere. A notable installation is also here shown. The advantages are said to be a more uniform case, produced in a manner which avoids injury to carefully machined surfaces. When such work is slowly cooled, economy in heat and time may be had by using the new thermo-syphon heat exchanger. It consists of an insulated chamber big enough for two baskets of work, one hot from the furnace, the other cold.

Heat Treating in Gaseous Atmospheres

Other instances of new developments in heat treating by the use of gaseous atmospheres are the nitriding process, mentioned earlier in this article, and furnaces for heating in a hydrogen atmosphere. A fine example of the latter is that designed and built by General Electric Co., Schenec-

A Basket of Rings Being Charged Into Vertical Furnace for Gas Carbonizing. Control of furnace atmosphere is given increased attention

tures in single pieces of gas-burning equipment. Single furnaces costing \$20,000 are installed frequently; the largest noted in recent months cost \$65,000.

The Surface Combustion Co., Toledo, Ohio, also visions an increase in interest in gas furnaces, but only if they are correctly designed and installed, and adequate for the intended duty. Past development work has occurred chiefly after cut-and-try experiments, and to avoid continuing this practice, the company has established research and development laboratories. The former inquires into the fundamen-

transformer is needed. The Sentry Co., Taunton, Mass., uses a nichrome ribbon, wound in double helix in such a manner that an almost continuous heating surface radiates to the pot wall. A special alloy drain tube is built into the base, to prevent drip from building up and short-circuiting the heating elements. In passing it might be mentioned that the Roessler & Hasslacher Chemical Co., New York, has developed a non-poisonous material known as R. & H. drawing salts, suitable for temperatures between 300 and 1100 deg. Fahr. It is thus suitable for heat coloring and

Pusher-Type Furnace for Heating Parts in Atmosphere of Hydrogen, Suitable for Bright Annealing or for Making Joints by "Coppering" Process (General Electric Co.)

tal scientific basis of any proposed development, and the latter designs, constructs and experiments with the units before building the furnaces for the customer.

Electrical Heat Applications

Electric heat has been used long enough for metal treating to establish a secure field. Aside from its ease of control, perhaps its outstanding advantage is the ability to place a furnace in a production line of precision tools, without the distractions of noise and exhaust gases. Consequently the most interesting things to report in the electric furnace field are heating applications of unusual size or unconventional service.

Thus, Hoskins Mfg. Co., Detroit, one of the pioneer builders, reports that the furnaces built today produce about 25 per cent more per kw-hr. of current consumed than units in similar service built a few years back. Due to automatic features of heat control, charging and discharging, labor costs are sharply cut.

New designs for electrically heated pots are being vigorously pushed. The Harold E. Trent Co., Philadelphia, has recently marketed them for operating salt, cyanide or lead baths up to 1700 deg. Fahr. The feature of this design is a very narrow clearance between insulated casing and the pot, this annular space being occupied by a bent resistor of the grid type. Electric characteristics are such that no

low tempering, and is said to be non-hygroscopic and non-adherent to the hot metal.

A notable invasion of new fields by electric heat is made by the Electric Furnace Co., Salem, Ohio. A pit-type furnace of this make for annealing alloy steel bars is here shown, one of a group of six special furnaces recently installed by them for the Timken Roller Bearing Co. This furnace holds 50 tons of steel; the heater grids are protected at the sides by buffer beams. When loaded a 25-ton cover is placed and sealed with sand. Electric connections are adjustable for rapid heating, and then for soaking at constant temperature. After slow cooling through the critical range, further cooling in the furnace may be hastened by blowing air through a pipe labyrinth built into the brick walls of the pit. In this manner the time cycle is materially reduced.

Electric heat is also being used for heating bars and billets prior to forging. Holcroft & Co., Detroit, are installing Globar non-metallic resistors in electric forges, both batch type and continuous. A wide variety of forge furnaces have been intensively developed by this company, and at present it is engaged in extended experimentation on a new gas-fired unit. Forges using either oil, gas or electricity have been developed to a high state of efficiency in recent years.

The Mahr Mfg. Co., Minneapolis, reports increasing in-

terest in modern labor saving heat treating devices in some branches of the metal working industry which have received little publicity. Thus, the Hughes Tool Co., Houston, Tex., maker of oil drilling machinery, has replaced a number of batch type furnaces with two continuous trains for semi-automatic operation. In each train three lines of forged tool joints are pushed slowly through a heating furnace, and quenched one by one in oil. A conveyor delivers these

pieces to the drawing furnace; they are pushed through, quenched in water, and delivered by conveyor to Brinell hardness testing machines. Such equipment is expected not only to save labor, but to produce drill joints of highest quality and uniformity, and thus avoid expensive breakages down deep in the well. A sketch of part of this installation is given in the accompanying line drawing on the opposite page.

Furnace Auxiliaries and Control Apparatus

IT is only natural that developments in furnace design should be accompanied by corresponding improvements in the various details, auxiliary apparatus and control. Notes on heat resisting alloys, so necessary in the construction, have already been given in the first section of this review. Some auxiliaries like pyrometers have been well standardized in the past; models now on display differ only in details. An exception to the latter statement will be displayed by Thwing Instrument Co., Philadelphia, an in-

an operating furnace equipped with its "three-position balanced controller." Upon starting a cold furnace, such a controller opens valves at a predetermined rate to give a rapid heat, yet reduces the fuel supply gradually as the correct temperature is reached so as to avoid "overshooting." Slight changes in furnace temperature will cause slight corrective changes in fuel supply, but a large drain on the heat will cause a large increase in combustion rate. As in the heating stage, the valves are automatically regulated to

Development Laboratory of Surface Combustion Co., Where New Designs Are Studied and Perfected

closed type of radiation tube, containing a lens (with cleaning shutter) to focus the heat rays on a sensitive thermopile, and thus develop potential to actuate either an indicating or recording instrument. A perfected design of recorder, called Model 28, will be exhibited for the first time.

An accompanying illustration shows a permanently mounted radiation pyrometer in the tool department of Hess-Bright Mfg. Co. A radiation tube is contained in the square box, sighted through a hole in the side of the muffle directly upon the high speed steel being heated. To prevent the flare of hot gases, an air jet blows continually across the aperture. This control equipment operates indefinitely at temperatures up to 2500 deg. Fahr.

Controls for burners or heating circuits have been developed which possess almost human intelligence. The Automatic Temperature Control Co., Philadelphia, will have

prevent overshooting, even if a counter movement is required by the particular furnace. Compensation for controller and thermocouple lag may also be made.

Other devices are for controlling the operation of the furnace by the changes occurring in the heated metal—evidently a more direct matter than relying upon the temperature of one or more points in the furnace atmosphere. The Stanley P. Rockwell Co., Hartford, Conn., will exhibit the new remote control model of the Rockwell Dilatometer here reproduced. As may be well known, this device records the changes in expansion rate as steel is heated through the critical range. A quartz tube rests on the hot steel, and its movements up and down are transmitted and magnified by a simple lever and recording system. Heretofore the device could only be mounted directly over the furnace, but in the present modification, as shown in the view, changes in position of the quartz rod (at the left) cause

changes in pressure in a closed liquid system, and are equally reflected by movements in the group of diaphragms at the recorder, the latter located at any convenient distance.

Carbon steels lose their magnetism when passing through the critical range, and this property may be utilized to control the heat treatment. The Hevi Duty Electric Co., Milwaukee, will demonstrate such equipment, known as Hevi-Duty Wild-Barfield electro-magnetic furnace. A detector relay, operated by windings in the soaking zone of the furnace, controls the pusher or conveyor mechanism in such a manner that at a given time interval after the piece loses its magnetism it is ejected from the furnace. Such a relay may also operate signal lights or bells.

New Refractory Equipment

Several manufacturers of refractory materials will offer developments in this department. The Armstrong Cork & Insulation Co., Pittsburgh, has marketed an insulating brick for equipment operating at temperatures up to 2500 deg. Fahr. It is thus applicable to high speed and melting furnaces which would cause excessive shrinkage or spalling of the older insulators made of diatomaceous earth.

The George P. Reintjes Co., Kansas City, will exhibit new shapes of corner bonding and expansion joint tiles illustrated in the drawing here reproduced. It builds readily into the brickwork, and by merely turning one of a pair over, it makes a corner joint, well keyed, yet allowing expansion clearance. Interlocking flat arch tiles requiring only three shapes have also been devised.

The Botfield Refractories Co., Philadelphia, has produced Adamant-Adachrome, a refractory cement especially adapted for facing and patching brickwork by means of a "gun" which sprays the slurry against the wall.

Various Furnace Auxiliaries

Other exhibitors of furnace auxiliaries are the Sullivan Machinery Co., Chicago, which exhibits gas compressors for boosting the pressure of the fuel supply as needed, and the Spencer Turbine Co., Hartford, Conn., which finds a considerable fraction of its output being absorbed by builders of heating and heat treating furnaces to burn oil or

Near the Floor May Be Seen a Reeves Variable Speed Transmission for Controlling Speed of Round Plate, Forming Bottom of Electric Furnace

gas. While most of them are small in size, as shown in the cut, units as large as 150 hp. are required at times.

The Reeves Pulley Co., Columbus, Ind., manufacturers of variable speed transmissions, reports that many furnace builders provide this adjustable device on continuous furnaces. An illustrative installation is on the baking ovens of Atwater Kent Mfg. Corporation. Various sizes of radio cabinets are in production, and in order to secure the proper results it is necessary to vary the speed of travel, closely controlled according to the size and design of the metal ware. One of the illustrations shows a Reeves transmission for driving the round plate forming the bottom of an electric furnace.

Turning now to the important duty of cleaning and handling heat treated work, several firms will be found exhibiting machines and chemicals for such purposes. The J. B. Ford Co., Wyandotte, Mich., finds that the phrase "chemically clean" must be literally interpreted by those

Precision Brinell Testing Machine, With Automatic Cycle of Loading, Holding and Release (Pittsburgh Instrument & Machine Co.)

Machine for Cleaning Metal Parts by Tumbling in a Mixture of Stars and Sand. Abrasive material automatically Separated and Returned to the Drum (Ideal Industrial Machinery)

engaging in chromium plating, and has expended much time and energy in discovering the best combination of materials and processes for this class of work.

Cleaning equipment as represented by tumbling barrels will be exhibited by the Ideal Industrial Machinery, Cincinnati. One of the pictures shows a machine which tumbles metal parts in an equal quantity of stars and sand. This

proportion serves to prevent collision between the forgings, and to produce a finish on them hardly distinguishable from a sand blasted surface. Work is loaded by power in batches. When the finish is correct, the direction of rotation is reversed. The stars and sand are automatically screened out, returned to the tumbling compartment, and the forgings discharged at the open end.

Testing Equipment for Controlling Production

HARDNESS testing for the control of production is becoming more and more the vogue, and for that reason at least three firms will exhibit new types of machines operating on the Brinell principle. The Molybdenum Corporation of America, Pittsburgh, will have a Vickers hardness testing machine, particularly adapted to test the nitrided steels in which the exhibitor is greatly interested. This machine was described in detail in *THE IRON AGE* for March 1, page 602.

The Pittsburgh Instrument & Machine Co., Pittsburgh,

high degree by the increasing impact of a shower of steel balls.

The Riehle Brothers Testing Machine Co., Philadelphia, will exhibit a diversified line of physical testing machines, but are proudest of the 2,000,000-lb. tension machine re-

Riehle Testing Machine, Installed at Roebing's for Hudson River Bridge Work, Could Pull Apart a 6-In. Bar of Structural Steel

Motor Driven Brinell Machine for Inspection Purposes (Tin-ius Olsen Testing Machine Co.)

Leitz Metallur-scope, Mounted So As to Examine Surface of Round Bar

has just placed on the market a precision machine whereby the correct rate of loading, maintenance, and release is automatically controlled. It has been found that most errors in hardness measurement occur through hastening one or more of these three stages. In this new machine these operations are controlled in a fixed cycle by a motor-driven cam and lever system. The system of weights and levers shown in one of the pictures insures a high degree of accuracy in the load.

A production type of Brinell machine will be demonstrated by Tin-ius Olsen Testing Machine Co. It is motor driven, all moving parts are under forced lubrication, and it may be operated continuously without undue effort by the operator. A more rapid machine built under the Johnson patent will be shown for the first time, as well as the Herbert Cloudburst tester and hardener, wherein the surface of metal may be gradually work hardened to a

cently placed in operation at Roebing's. This machine, a photograph of which is here reproduced, is installed primarily to proof test loops of full-sized suspender cable, 25 ft. long, made for the new Hudson river bridge. It is said to be the largest universal testing machine in existence, and could pull apart a 6-in. billet of structural steel. Special recoil apparatus is required to absorb the shocks at sudden breakage of a specimen under test, and to avoid damage to the knife edges. Despite its capacity and size, the sensitivity is such that the balance responds to a slight pressure of the hand.

An innovation in metallographic equipment known as the Metallur-scope may be seen in the exhibit space of E. Leitz, Inc., New York. It may be seen to be a self-contained optical system, somewhat portable yet accurate, and designed for industrial laboratories where high powers are not needed, or for inspection purposes in the shops. The

view shows it mounted on vee blocks for examining the surface of a round bar. When clamped to a rail on a table top, with the objective turned in a vertical direction, and

a stage attached to the upright bar, smaller specimens may be examined in the usual way. A camera box may also replace the eyepiece for photography.

Metal Cutting Tools and Fixtures

COMPETITIVE conditions in the metal trades are so exacting that manufacturers find themselves driven to economies which in less strenuous times would have been given little thought. A new method of fabrication that may only reduce the amount of scrap is given serious consideration. Increasing accuracy and interchangeability is often demanded, even of minor parts, and this throws

Turret Lathe Tooled With Rugged Multiple Cutters to Work Machine and Part at Maximum Speed

Pels Gate Shear With Rolled Steel Plate Frame Cutting $\frac{3}{4}$ -In. Plate, 8 Ft. Wide, at Eggleston Brothers & Co., Long Island City

back a more and more severe demand for limited tolerances on the machines, and increased accuracy on the tools. Labor costs must be reduced by driving machines to the limit of endurance, and getting the maximum out of the tools, jigs and fixtures. Exhibitors in the machine tool

section at the Commercial Museum, even though presenting a wide variety of equipment, all emphasize these recent trends in production.

The Kelly Reamer Co., Cleveland, emphasizes that the machine tool is no better than the cutting units furnished it. Multiple cutting tools of rugged design, adjustable to compensate for wear, are necessary to attain full production. An accompanying illustration shows a Gisholt machine tooled by the Kelly company upon the above theory. While this view does not show the peak of multiple cutting at the same time, it does show the ultimate which can be reached upon this piece, as only three positions are taken for boring and reaming, giving two boring cuts and a finish ream. The reaming bar in the fourth position for finish reaming two diameters simultaneously is especially notable, for it does the work which ordinarily would require a double position for small tolerances.

Close-Up of Cutter With Inserted Teeth, Adjustable Both Out and Sideways (National Twist Drill & Tool Co.)

Morse Twist Drill (Below) Capable of Drilling $13\frac{1}{2}$ Inches Into Manganese Steel Castings With One Grind

This same idea of rigidity and adjustability for wear is featured by the Union Mfg. Co., New Britain, Conn., in its line of lathe, drill and planer chucks, and by the National Twist Drill & Tool Co., Detroit. A cutter with inserted teeth made by the latter firm is here shown. One side of the slot is covered with tiny pyramids which match the serrations clearly shown on the back of the blades. The locking wedge and set screw then holds these inserted teeth securely in the correct position, even when working at very high feeds.

Drills for Cast Manganese Steel

The Morse Twist Drill & Machine Co., New Bedford, Mass., has achieved what has long been regarded as impossible, namely, a tool which will cut high manganese steel castings. High speed drills turning at 12 r.p.m., with 0.003 in. feed crumble on the cutting lips after drilling $\frac{1}{4}$ in. into

such metal. A $\frac{3}{4}$ -in. hole might be drilled in 100 min. by a hardened and untempered carbon steel drill, after five grinds. One picture herewith shows the new drill running at 50 r.p.m., with 0.0075-in. feed. Nine $1\frac{1}{2}$ -in. holes were drilled with one grind.

Another exhibit of the extra heavy duty demanded of present-day tools will be found in that of Henry Pels & Co., Inc., New York. Its line of punching and shearing machines, with main frames made of steel plate, includes the gate shears designed along the lines shown in an accompanying cut, with a capacity of a 12 ft. x 2 in. plate. During the past year a line of heavy presses has been developed, using the same steel plate frame construction.

Rugged Machines for High-Speed Saws

Real progress is apparently being made in the field of metal sawing, lifting it into a speedy, economical, almost

Above Is a Zeiss Measuring Machine Capable of Reading to 0.00001 Inch

At Right Is Indicated Method of Controlling Keller Die Cutting Machine by Two Tracers, the Upper Guiding the Cross Sectional Travel of the Tool, and the Lower the Outline. At the upper right is an inset illustrating a forging die for a crankshaft, cut by use of the sheet metal templates shown

a precision operation. This has been effected by the combination of improved saw blades of alloy steel and rigid sawing machines.

E. C. Atkins & Co., Indianapolis, will have a display of "Silver-Steel" hacksaw blades, said to be the first line of genuine high-speed steel made commercially in the United States. L. S. Starrett Co., Athol, Mass., will show a line of high-speed saw blades developed and placed on the market in recent months.

The Atkins company and Peerless Machine Co., Racine, Wis., will also feature modern hacksaw machines. The latter are characterized by saw blades mounted across the center of square frames, instead of across the top of an open U. This construction provides rigidity to stretch the new blades at that high tension required for rapid traverse and heavy cuts. The saw frame is also guided in upper and lower ways, and the work clamped in substantial vises or on angle fixtures, so the operator is enabled to cut metal to very close dimensions, and on occasion to use the equipment to block out dies and punches.

Die making machines, and precision units for tool rooms will also be in evidence in the machine tool section of the Steel Treathers' show. Marburg Brothers, Inc., New York, will show a line of imported labor saving filing and sawing machines for punch and die work. The process consists of laying out the shape on a slab or plate of suitable steel, drilling a small hole alongside the cut, sawing along the line with a finely set saw, then replacing the saw with a file and filing on the machine until a perfect fit is secured to the template.

Precision Equipment for Tool Rooms

The Keller Mechanical Engineering Corporation, Brooklyn, N. Y., will demonstrate the latest developments in the control of die cutting machines by combined use of two tracers for work with cavities of three dimensions. An accompanying cut illustrates the two-tracer method, the upper tracer controlling the cross section and the lower the outline. By this means complete models for the dies are no longer necessary, they being replaced as shown in the illustration just below by a series of templates cut out of metal $1/32$ in. thick.

Jig borers of Swiss manufacture may be seen at the

exhibit of the R. Y. Ferner Co., Washington. While this particular machine is built primarily to drill holes with center lines precisely parallel, it also has a universal tilting table by means of which holes may be bored at any angle in the piece, and to notably close accuracy of angle and location.

Another high precision instrument in the form of a 40-in. measuring machine will be shown by George Scherr Co., Inc., New York. It is manufactured by the German optical firm, Carl Zeiss, and is said to have an accuracy of $1/20,000$ -in. over the range. Head stocks and tail stocks are adjustable in 4-in. steps, and located by glass marks imbedded into the frame of the machine. After the piece to be measured has been properly mounted, readings to the nearest 0.005 in. are made by the rear microscope, viewing a graduated glass rule. Subdivisions to 0.00001 in. are then estimated through the forward eyepiece, called the optimizer, with optical system in line with the piece to be measured, a detail which is required for highest accuracy.

Steel Treaters' Exhibit Opens Oct. 8

Commercial Museum, Philadelphia, Will House Displays
of Nearly 250 Companies Prominent in the Making,
Working, Treating and Fabricating of Steel

NEARLY 250 companies will be represented by exhibits at the annual convention of the American Society for Steel Treating to be held at the Commercial Museum, Philadelphia, the week beginning Monday, Oct. 8, to be known as the second annual National Metal Week. It is estimated by the society that fully 25,000 metallurgists, executives and others interested directly in the metal industry will attend. The American Welding

Society and the Institute of Metals are participating in the event with the American Society for Steel Treating.

The National Metal Exposition will be housed in the Commercial Museum, which has 80,000 sq. ft. of available exhibit space. The exhibits will represent the metal working, fabricating and treating industries, as well as the making of steel. A list of the exhibitors, together with the products they will exhibit, is given below.

List of Exhibitors and Products They Will Show

Abrasive Co., Philadelphia. Booth 221.

High Speed swing frame grinder snagging steel castings demonstrating Red Center high-speed wheels of Borolon bakelite grinding wheel segments; bricks, sticks and stones. Represented by: R. A. Shaffer, vice-president; S. M. Hershey, sales manager; J. F. Fischer, assistant sales manager; W. A. Ruppel, L. R. Burnes, W. B. Ilko, I. R. Blair.

Acme Electric Welder Co., Philadelphia. Booth 130.

A 6 kw. spot welder; a 35 kw. spot welder with a 48-in. throat; also a butt welding attachment. Represented by: George M. Hessdoerfer.

Air Reduction Sales Co., New York. Booths 129 and 131.

Airco 99.5 oxygen and Airco acetylene in cylinders, Airco D-B oxygen discharge manifold, Airco D-B welding and cutting torches, regulators and supplies; the Radiograph, motor driven and portable, for oxyacetylene cutting of steel plate, forgings, billets, risers, etc.; No. 4 Oxygraph, a new machine of greater scope than the No. 2 Oxygraph, with structural improvements, for oxyacetylene cutting of light and heavy sections and production shapes; first showing of new No. 2 Camograph, improved and cutting area extended, for reproduction cutting of shapes from steel plate. Represented by: W. W. Barnes, W. H. Eliason, A. T. Walker, C. D. Trout, W. L. Humphreys, H. B. Hand, C. S. Peters, W. H. Ludington, H. L. Rogers, A. H. Yoch, Fred Judelson, F. E. Rogers, G. Van Alstyne, J. J. Crowe.

Ajax Electrothermic Corporation, Trenton, N. J. Booth 34.

High speed induction heat treating furnace.

Allegheny Steel Co., Brackenridge, Pa. Booth 118.

Samples of Allegheny metal products and sheets, bars, tubes, etc., of high heat-resisting Ascoloy. Represented by C. B. Calomon, manager of alloy sales; P. M. Otte, L. W. Hostettler and W. R. Murphy, engineers.

Edgar Allen Steel Co., Inc., and A. Milne & Co., New York. Booth 300.

From A. Milne & Co.: FJAB tool steels, die steels, hollow die steels; AMCOH hollow die steel; FJAB hollow drill steel, Auger drill steel, special sections; MR Lancashire iron and electrical iron; Prince ball bearing steel and ball wire; S. & C. Wardlow, Ltd., cutlery sheets, gin saw sheets, hack saw sheets, and file sections; NOHAB anvils; and FJAB hammers. From Edgar Allen Steel Co., Inc.: Imperial Major high-speed steel, extra special high-speed steel, and special high-speed steel; turning and finishing steels; Minerva air-hardening steel; self-hardening steel and special chisel steel; Red Label steel; tack knife steel; die-casting steel; Solid Double Six production steel; hollow Double Six production steel; class P tool steel; class E tool steel; Stag drill steel; and Talon drill steel. Represented by Henry Sears Hoyt, member A. Milne & Co. and president, Edgar Allen Steel Co., Inc.; J. King Hoyt, Jr., member of A. Milne & Co. and secretary-treasurer, Edgar Allen Steel Co., Inc.; V. A. Greene, vice-president and general manager, Edgar Allen Steel Co., Inc., and sales manager, A. Milne & Co.; R. P. Rice, G. K.

Boland, A. E. Van Stone, E. R. Carnell and H. R. Adams, salesmen.

American Brass Co., Waterbury, Conn. Booth 97.

Complete line of Anaconda copper alloy welding rods; a demonstration of oxyacetylene welding by Charles Gallo (expert welder) using Tobin bronze filler rods, an exclusive product of American Brass Co.; Everdur (manganese-silicon bronze) also on display in the form of sheets, rods, tubes, castings, wires, bolts, rivets, etc. Represented by: A. M. Dinkler, C. W. Swift, W. H. Dowd, W. J. MacLean, John Becht, G. M. Hurlbut, J. H. Larmett, C. M. Saltsman, D. E. Hotchkiss.

American Car & Foundry Co., New York. Booth 24-A.

Berwick electric rivet heater and Berwick electric forging heater. Represented by: F. C. Cheston, John S. Helt.

American Gas Association, New York. Booths 1 to 14, 35 to 50.

Latest developments in gas-fired heating furnaces, including practically all types of combustion systems; completely outfitted metallurgical laboratory showing latest improved automatic sample polishing machine, hardness tester and micro-metallographic microscope. Represented by: D. W. Chapman, chairman American Gas Association Committee on Display at Industrial Exhibits, and members of this committee including H. S. Christman, A. P. Apmann, R. B. Burr, E. B. Dunkak, E. W. Rowand.

American Gas Furnace Co., Elizabeth, N. J. Booth A. G. A. section.

One of new, large size, rotary retort carburizing machines having a capacity of 1000 to 1250 lb. of work per charge. As in the smaller machines the retort is of highest grade heat resisting alloy. The furnace lining is practically monolithic and is backed by 9 in. of insulation. Individual motor drive is provided for rotating the retort and tilting and a small hoist is provided for handling the retort cover; a small rotary carburizing machine, capacity 75 to 100 lb. of work; also other furnaces. Represented by: P. C. Osterman, vice-president; John Mehrman, Gustav Schwab, Theodore Farwick, Sr., Elmer C. Cook, F. W. Hornbruch.

American Manganese Bronze Co., Philadelphia. Booth 263.

Specimens of manganese-bronze castings.

American Metallurgical Corporation, Boston. Booths 65 and 66.

Following new models of the American electric furnaces: HB-1 20 kw. 8 x 16 in. high-speed (temperatures up to 2400° F.); P-1 8 kw. 6 x 10 in. salt; B-2 15 kw. 12 x 24 in. tool room furnace; lead, salt or cyanide pots and box furnace for carburizing, hardening and annealing. Represented by: K. A. Juthe, president; S. N. Juthe, vice-president; A. J. Hanson, chief engineer; John C. Juthe, sales manager; A. B. Beach, L. A. Smith, A. D. Heath, E. E. Bolds, A. A. Anderson.

American Steel & Wire Co., Chicago. Booth 98.

Welding wire.

Ampco Twist Drill Co., Jackson, Mich. Booth 244.

Two automatic drilling machines requiring approximately 50 sq. ft. and weighing combined 10,000 lb.; display board of

drills and reamers. Represented by: George Melling, inventor of machines; Oscar Monrad, president; W. E. Loy, general manager; F. J. Sikorovsky, superintendent; G. G. Chapman, David O'Brien, Mr. McCumber.

Armstrong-Blum Mfg. Co., Chicago. Booth 203.

No. 8 Marvel metal band saw,—a fully universal metal saw for cutting off bar stock, for tool room and die work, for miscellaneous cutting of pipe, structural shapes, formed mouldings, etc., both straight and miter cuts; No. 5 Marvel automatic high-speed saw,—a fully automatic production cutting-off machine which has been increased in weight, has larger bearings and other improvements; No. 4 Marvel high-speed hack saw. Represented by: Harry J. Blum, secretary; G. L. Hunt, S. A. Woleben.

Armstrong Brothers Tool Co., Chicago. Booth 201.

Lathe, planer and shaper tools, lathe dogs, "C" clamps, ratchet drills, drop forged wrenches, pipe tools. Represented by: Horace Armstrong, secretary; A. F. Arbogast, G. L. Hunt.

Armstrong Cork & Insulation Co., Pittsburgh, Pa. Booth 24.

Armstrong's and Nonpareil insulating brick for furnaces, ovens, etc.; high pressure covering and blocks for steam equipment; cork covering for refrigerated lines; corkboard for cold storage rooms, insulation of residences and the roofs of buildings. Represented by: H. B. Gates, S. L. Barnes, John R. Livezey.

E. C. Atkins & Co., Indianapolis. Booth 220.

No. 4 metal cutting bandsaw machine; No. 18 Kwik-kut power hacksaw machine; No. 7 Kwik-kut power hacksaw machine; Silver-steel hacksaw blades. Represented by: Edward S. Norvell, W. H. Sherer, L. C. Garvin.

Atlas Steel Corporation, Dunkirk, N. Y. Booth 77.

Chrome bearing steel products; stainless iron and steel products; cold header dies and products; fractures of the principal brands of tool steel; L-XX high-speed steel forgings. Represented by: A. F. Dohn, president; F. B. Lounsberry, vice-president and works manager; C. P. Burgess, vice-president; W. H. Wills, W. R. Breeler, Gustaf Peterson, S. B. Matthews, James Malloy.

Automatic Nut-Thread Corporation, Philadelphia. Booth 178.

Automatic nut tapping machines.

Automatic Temperature Control Co., Philadelphia, Pa. Booth 174.

Motor-operated valves controlling fuel and air to industrial furnaces; other control devices. Represented by: J. D. Andrews, sales manager; C. Wilhelm, G. H. Johanson, G. S. Frazee, R. A. Smart, R. C. Lawlor.

B

W. O. Barnes Co., Detroit. Booth 191.

Barnes Red Arrow high-speed steel hack saws. Represented by: W. O. Barnes, president; J. H. Flavell, secretary-treasurer; F. M. Shaw, William Gross, C. G. VanTuyt, R. Schindler, C. B. Cecil.

Bastian Blessing Co., Chicago. Booth 128.

Complete line of welding and cutting equipment, including new approved portable acetylene generator and oxygen manifold. Represented by: E. L. Mills, sales manager; E. N. Stevens, assistant sales manager.

Bausch & Lomb Optical Co., Rochester, N. Y. Booth 216.

Metallographic equipment with several new improvements, as well as the contour measuring projector for inspection of screw threads, gear forms, etc.; the toolmaker's microscope for the checking of screw threads, measurements of small parts, etc.; also microscopes for the inspection of raw and finished products, and other optical tools of general interest to manufacturers in the metal working industry. Represented by: J. A. Ccheick, J. I. Wexlin, W. L. Patterson, I. L. Nixon, E. H. Anthes.

Bellevue Industrial Furnace Co., Detroit. Booth 68.

Several small heat treating furnaces. Represented by Walter E. Hinz, president; Louis J. Raymo, sales manager.

Bellis Heat Treating Co., Branford, Conn. Booth 72.

Lavite for hardening, tempering, annealing; new electric Lavite furnace. Represented by: A. E. Bellis, J. W. Black, R. C. Jordan.

Bethlehem Steel Co., Bethlehem, Pa. Booths 111 to 114.

A display of various grades of Bethlehem tool steels and Bethlehem stainless steel; an exhibit of alloy steels including an operating exhibit of silico-manganese spring steel; a display of interesting types of forgings and castings; structural steel sections; miscellaneous finished products illustrating the application of various grades of steels. Represented by: R. S. Tucker, manager of sales alloy steels; W. R. Shimer, metallurgical engineer; Henry Wysor, metallurgical engineer; A. P. Spooner, engineer of tests; H. G. Walton, general manager

of sales; G. F. Hocker, manager of sales forgings, castings, etc.; D. C. Roscoe, manager of sales tool steels; E. A. Buxton, assistant superintendent tool steel department; G. P. Witteman, tool steel development engineer; H. C. Bigge, superintendent tool steel department; T. G. Foulkes, assistant research metallurgist; W. C. Hartman, assistant research metallurgist; A. McDonald, assistant research metallurgist; E. R. Long, superintendent central tool department; W. B. Kennedy, manager of sales Philadelphia district; J. H. Stoll, M. W. Dalrymple, W. E. Titus, W. S. Lippincott, H. E. Graffin, E. H. Jamison, H. R. Weeman, J. D. Coddling, G. A. Cushman.

Blax Flexible Shaft Co., New York. Booth 286.

Portable flexible shaft machines, flexible shafting, portable grinders, portable sanding machines, die sinking and rotary filing machines. Represented by: R. Wezel, president; F. I. Vanderbeek, vice-president; G. M. Vanderbeek, secretary-treasurer; and from Riter Brothers, M. Buehler and Mr. Riter.

G. S. Blakeslee & Co., Cicero, Ill. Booth 299.

Blakeslee Niagara and pump type metal cleaning equipment for cleaning all kinds of stamped and machined parts, removing the oil, grease, dirt, chips, etc., prior to inspection, assembling, painting, etc. Represented by: G. R. Blakeslee, president; J. W. Dammers, secretary; A. T. Nogrady.

Charles Bond Co., Philadelphia. Booth 176.

Gas welding and cutting apparatus manufactured by Torch-weld Equipment Co., Chicago; the new Reeves variable speed transmission, manufactured by Reeves Pulley Co., Columbus, Ind. Represented by: W. A. Slack, president Torch-weld Equipment Co.; Charles Irwin, Reeves Pulley Co., sales engineer; T. A. Bergen and L. R. McKean, Charles Bond Co., sales engineers; C. Carter Bond, managing director Charles Bond Co.

Botfield Refractories Co., Philadelphia. Booth 59.

Adamant fire brick cement; Adachrome and Adachrome fines; the Adamant gun; Adapatch, plastic patching material. Represented by: Axel H. Engstrom, sales manager; L. B. Botfield, W. B. Smith, S. C. Lott, Joseph J. Sweeney, A. J. Wittwer, W. E. Tierney, Charles C. Phillips.

H. Brinton Co., Philadelphia. Booth 309.

Special machined parts, raw materials for all classes of manufacturing. Represented by: John Leafstrom, Elmer Nicholson, Wilfred Vaughan, Harry Doenges.

Bristol Co., Waterbury, Conn. Booth 21.

Bristol recording and indicating instruments, also electric controllers and motor operated control valves. Represented by: H. L. Griggs, general sales manager; H. W. Moss, G. H. Gaites, I. F. Inderdohnen, J. H. Ferguson, E. R. Wyatt.

D. P. Brown & Co., Philadelphia and Detroit. Booth 277-A.

Teon, a waterproof, oil and acid-fume proof belt that is not injured by heat up to 300 deg. Fahr.; Brown's woven endless belts, that have no end; Sprucolite, a new pulley, made of compressed spruce. Represented by: John McCauley, W. E. Warren, F. R. Andrews.

Brown Instrument Co., Philadelphia. Booth 116.

Pyrometers, flow meters, thermometers, automatic control valves, thermocouples, portable instruments, etc. Represented by: G. W. Keller, sales manager; J. P. Goheen, secretary; L. M. Morley, W. H. Lukens, K. R. Knoblauch.

Brown Lynch Scott Co., Monmouth, Ill. Booth 228.

Screening machine for cleaning and grading carburizing compound. Represented by: W. B. Lynch.

Budd Manufacturing Co., Edward G., Philadelphia. Booth 168.

Automobile metal stampings.

C

Andrew C. Campbell, Inc., Bridgeport, Conn. Booth 264.

Various sizes of nibbling machines in operation. One recent interesting adaptation of this machine was made for trade using slotted tubes, especially oil burner manufacturers.

Carborundum Co., Niagara Falls, N. Y. Booth 31.

A general display of abrasive material, including crankshaft wheels for roughing and finishing, Aloxite Redmanol cam wheels, tool room wheels, internal grinding wheels, centerless wheels, etc., Carborundum and Aloxite polishing grain, abrasive paper and cloth. Represented by: S. F. Courter, general sales manager; W. J. Griffin, district sales manager, Philadelphia; G. E. Chorman, Boyd Work, A. H. Prey, G. T. Kretschmar, E. C. Maguire, H. L. Henszey, J. F. Brady.

Carborundum Co., Perth Amboy, N. J. Booth 33.

Model demonstrating method of applying Carborundum combustion chambers to car type annealing furnaces; model of

Carborundum recuperator; model of wire annealing furnace, equipped with a Carborundum arch between the combustion and annealing chambers; Carborundum and Aloxite super refractories for high temperature installations; insulating Infrac refractory fire brick; various grades of high temperature cements. Represented by: C. E. Hawke, sales manager; John G. Fritzinger, F. W. Miller, R. A. Beverley, C. A. Dutton, S. A. Fenno.

Carpenter Steel Co., Reading, Pa. Booth 171.

Various articles made of Carpenter stainless steels, showing definite applications of the five grades of Carpenter stainless steels now on the market. Represented by: F. A. Bigelow, president; J. H. Parker, vice-president; R. V. Mann, F. R. Palmer, J. E. Sharp, E. P. Pyewell, B. H. DeLong, G. V. Luerssen, P. B. Greenawald, W. H. Kemper, W. M. Loos, G. H. Edmunds, J. B. Guthrie, R. L. Williams, C. A. Heil, H. J. Joyce, Jr., C. W. Olsen, K. L. Crickman, W. O. Steele, R. Calvert, H. B. Gaylord, V. B. Fisher.

Case Hardening Service Co., Cleveland. Booth 117.

Hardening room materials and equipment: Bohnite, carburizing compound; Caseite, cyanide hardening compound; Cyanide, all grades; Drawite, drawing salts, range 300 deg. to 1200 deg. Fahr.; Bathite, hardening salts, range 1200 deg. to 1700 deg. Fahr.; Ni-Cro-Al, nickel-chromium-aluminum alloy pots and boxes; Cleancoat, lead pot covering; Non-Case, anti-carburizing plant; pressed steel pots; B & G oil coolers. Represented by: W. C. Bell, president; E. J. Gossett, vice-president; J. S. Ayling, sales manager.

Celite Products Co., Los Angeles, Cal. Booth 52.

Sil-O-Cel heat insulating materials with especial attention to Sil-O-Cel C-3 which has recently been used widely for the construction of complete ovens as well as furnace doors and bases, and is often applied with a cement gun as a veneer insulating course on regenerator walls, etc. Represented by: Frank C. Coe, Fred H. Emerson, Angelo Gossman, E. S. Crosby, vice-president and sales manager.

Central Alloy Steel Corporation, Massillon, Ohio. Booths 158-159.

Agathon alloy steels, Enduro stainless iron, Toncan copper mo-lyb-den-um iron, Agathon nitralloy. Represented by: B. F. Fairless, president; J. M. Schlendorf, vice-president in charge of sales; W. M. Garrigues, assistant general manager of sales; M. J. R. Morris, D. B. Carson, C. C. Willits.

Char Products Co., Indianapolis. Booth 200.

Char carburizing compound, a case hardening material in which the energizing substance is sealed within each grain of compound by a shell of carbon. The product is characterized by low shrinkage, low dusting loss and constant activity with very small amounts of new material added to the mix. Also Char lead pot carbon, Char annealing carbon and Char calcined carbon. Represented by: William Higburg, sales manager; C. B. Edwards, C. Q. Swenson.

Chicago Pneumatic Tool Co., New York. Booth 211.

Pneumatic tools, electric tools, "Hicycle" electric tools, Uniloy jointless rotor. Represented by: A. E. Goodhue, vice-president; A. M. Brown, T. P. Harris, L. J. Walker.

Chicago Steel Foundry Co., Chicago. Booths 75 and 76.

Pyrasteel carburizing pots and boxes; pots for lead, salt and cyanide; conveyor chain, hearth plates, pusher plates and grids, oil burner equipment; parts fabricated from Pyrasteel sheets and samples of Pyrasteel sheets. Represented by: David Evans, president; William J. Chapin, George J. Jeffrey; J. N. Bourg, of Park Chemical Co., Detroit, agent; George O. Desautels, Indianapolis, agent.

Chrobaltic Tool Co., Detroit. Booth 288.

High Duty alloy castings for resisting heat, acid and for electrical resistance purposes. Represented by: W. B. Sullivan, vice-president; L. H. Whiteside, C. M. Conner, J. M. Mull, A. A. Cash, Louis Eitzen Co., Murdock Company, Premier Machine Co.

Cleveland Twist Drill Co., Cleveland. Booths 265, 266, 267, 268.

Two high-speed drill presses demonstrating Cle-Forge high speed drills at various speeds and feeds; also a display of complete line. Represented by: H. G. Smith, F. M. Hoelzle, O. B. Hansen, G. Burkhardt, W. C. Weidig, R. G. Berrington, E. Horan, T. Thomas, H. P. Jensen, H. A. Baier, T. Skove, D. Burdett.

Climax Molybdenum Co., New York. Booth 163.

Molybdenum ore as it occurs, together with the concentrates produced from the ore and all the forms in which it is prepared for use by the iron, steel and industrial trades. The display includes various exhibits of commercial products employing molybdenum in their manufacture. Represented by: B. F. Phillipson, president; F. C. Langenberg, vice-president

in charge of research; J. B. Thorpe, W. P. Woodside, and R. L. Rolf.

Clipper Belt Lacer Co., Grand Rapids, Mich. Booth 197.

Complete Clipper line consisting of all models of belt lacers, belt fasteners or hooks, belt cutters and connecting pins. Represented by: Carl P. Field.

Coats Machine Tool Co., New York. Booth 283.

Krupp line of Mikrotast gages; Elasticometer spring testing machine; Prestometer micrometer fluid gages; Coats hand tachometers; Coats divided machine vises; Skailnot, scale preventive. Represented by: Charles E. Coats.

Colonial Steel Co., Pittsburgh. Booths 279 and 280.

Complete line of products, including high-speed and carbon tool steels in both bars and sheet stock; tool steel forging products such as blocks, rings and special forgings; also a number of fractured specimens in both the cast and heat treated conditions. Represented by: Lawrence Wood, general sales manager; T. H. Nimick, assistant general sales manager; H. C. Poole, assistant general sales manager; N. B. Hoffman, chief metallurgist; A. C. Muller, C. M. Stevenson, E. L. Earley, E. A. Carleton.

Cooper Hewitt Electric Co., Hoboken, N. J. Booth 170.

Represented by: C. F. Streb, sales manager; D. R. Grandy, R. B. Chipman, W. R. Flounder.

Crucible Steel Co. of America, New York. Booths 184, 185, 187 and 189.

Various grades of high-speed steel, special machinery steel, alloy and carbon tool steel, cold drawn specialties, stainless iron and steel, and non-corrosive steels. Represented by: F. B. Hufnagel, president; J. A. Mathews, vice-president; A. T. Galbraith, vice-president; J. M. McComb, vice-president; H. L. Gellinger, auditor; R. Michener, general sales agent; R. E. Christie, W. K. Krepps, J. P. Jayme, E. P. Gaffney, R. H. Heatley, J. W. Barnett, F. J. Dawless, W. H. Plage, Allan Fraser, C. E. O'Connor.

D

Danly Machine Specialties, Inc., Cicero, Ill. Booths 243, 245.

Die sets, standardized and "special"; leader pins, bushings, die shoes, punch-holders, dowel pins, pry bars, goose neck clamps, swivel head cap screws, automatic stock stop for punch presses, hollow head cap and set screws, pressure pad springs, fillister and socket head, stripper bolts, laps and lap arbors, and Danly transparent die set templates. Represented by: P. H. Danly, vice-president and general manager; A. G. Gullberg, A. L. Miller, H. F. Bitzer, C. F. Schonmann, M. W. Rouse, A. F. Wallace, J. R. Fitzsimmons.

Darwin & Milner, Inc., Cleveland. Booth 225.

Alloy tool steel with particular reference to non-deforming alloy die steels, either oil-hardening or air-hardening for maximum quantity production; form tool castings from patent Cobaltrom steel; patent Cobaltrom steel safety razor blades, etc. Represented by: Victor F. J. Tlach, president; John R. MacCracken, H. L. Harrison.

Dearborn Chemical Co., Chicago. Booth 231.

No-ox-id, chemically compounded rust preventive; No-ox-id-ized wrapper; powdered cleaners. Represented by: E. M. Converse, sales manager; C. A. Remsen, C. I. Loudenback.

Henry Disston & Sons, Inc., Philadelphia. Booth 274.

Steel and hack saw machine in operation, using the new Disston high-speed steel machine hack saw blades. Represented by: S. Horace Disston, vice-president; H. A. Baxter, manager of steel sales; J. C. Forrest, Ed. Ludy.

Donner Steel Co., Buffalo. Booths 173 and 175.

Cold drawn material and parts made therefrom. Represented by: W. F. Vosmer, vice-president; J. W. Donner, general superintendent; A. G. Greenamyer, assistant general superintendent; C. A. Cherry, assistant to vice-president. District managers as follows: H. G. Uphouse, Philadelphia; E. D. Pumphrey, Detroit; P. M. Guba, New York; H. C. Richardson, Cleveland; R. E. Sherlock, and W. C. Peterson, metallurgical engineers; L. C. Miller, J. W. Percy, F. H. Lammert and N. F. Tisdale from the metallurgical department.

Driver-Harris Co., Harrison, N. J. Booth 30.

Cast Nichrome in form of carburizing containers, retorts, muffles, furnace parts, etc.; Nichrome grade B, an addition to cast iron for tougher, stronger and harder iron easily machined; new development of Nichrome sheet boxes for carburizing. Represented by: H. D. McKinney, general sales manager; G. A. Lennox, assistant sales manager; J. B. Shelby, W. E. Blythe, J. C. Bllek, J. C. Henderson.

Duriron Co., Inc., Dayton, Ohio. Booth 169.

Complete line of Duriron and Alcumite pickling equipment including exhaust fans, Duriron circulating steam jets, Duriron centrifugal pumps for unloading acid, Alcumite sheet, Alcumite tie rods, Duriron pipe, valves and fittings. Represented by: W. E. Pratt, sales manager; P. C. Lewis, E. B. Thacker.

E

Eastman Kodak Co., Rochester, N. Y. Booth 271.

X-ray films and accessories for use in radiographic examination of metals. Represented by: E. E. Smith and A. W. Fuchs.

Eclipse Fuel Engineering Co., Rockford, Ill. Booth A. G. A. section.

New Design 7 hp. type D steam boiler complete with automatic pump unit and condensation receiver; ½ hp. boiler, miniature; 4 hp. type C boiler with No. 4 feed water regulator and automatic fuel cut-off; No. 2 lead hardening furnace complete with low pressure gas burners; No. 3 high-speed steel furnace with No. 1 high pressure proportional mixer, new design base complete with burner equipment for high-pressure blast steam boilers; automatic core oven burner; centrifugal blowers, No. 2311, No. 2515, No. 6815 two stage mounted; new design series C controller mounted in connection with No. 4615 blower for demonstration; display of pressure steel and pressed alloy pots; single and compound injectors, burners, burner tips, inspirator type burners, etc.; demonstrating unit for new type tunnel burners with cooling wells, connected to 10-lb. gas line; No. 5 rivet heater with high pressure proportional mixer; and No. 3621 blower with 5 hp. 220 a.c. motor for furnishing air. Represented by: O. M. Olsen, Walter Frederick, D. A. Campbell, J. M. Traugott, L. B. Maximon, G. W. McKee.

Electric Furnace Co., Salem, Ohio. Booth 70.

Electric heat treating furnaces and equipment for all purposes; literature, information, and illustrations of unusual and interesting electric furnace installations; engineering representatives available for consultation. Represented by: R. F. Benzinger, vice-president; F. T. Cope, chief engineer; A. H. Vaughan, assistant chief engineer; R. D. Thomas, E. P. Larkin, F. J. Peterson, S. Floyd Keener, T. B. Bechtel, N. H. Knowlton.

Electric Steel Founders' Research Group, Chicago. Booths 304 and 306.

High grade steel castings, small and medium sized. Represented by: R. A. Bull, director, and C. N. Ring, assistant director, Electric Steel Founders' Research Group, Chicago; A. C. Jones, research engineer, Lebanon Steel Foundry, Lebanon, Pa.; and David Zuege, research engineer, Sivyer Steel Casting Co., Milwaukee.

Electro Alloys Co., Elyria, Ohio. Booths 119 and 120.

Thermalloy castings for use in construction of furnaces, combustion chambers, carbonizing pots, oil burner parts, resistance grids and steel mills. Represented by: A. L. Garford, president; W. C. Whyte, vice-president; J. B. Thomas, treasurer; J. W. Henry, metallurgist; A. M. Miller, Jr., H. P. Miller and W. J. Hansen.

Electro Refractories Corporation, Buffalo. Booth 293.

Silicon carbide brick, in various shapes; high temperature cement; and Mag-NO-Spall brick. Represented by: L. U. Milward, president; C. A. Asher, representative.

Elkon, Inc., New York. Booths 142 and 144.

Elkonite dies and some accomplishments by their use. Represented by: G. N. Sieger, vice-president; J. A. Weiger, Eddie Bremer, J. T. Cox, George H. Rockey.

Endicott Forging & Mfg. Co., Inc., Endicott, N. Y. Booth 272.

Drop forgings for automotive, tractor and general engineering industry. Represented by: S. J. Marshall, president; T. B. Kelday, superintendent; George B. Reed and J. I. Smith.

F

Falls Electric Furnace Corporation, Buffalo. Booth 71.

Electric box-type furnace using Falls former full radiating sheet type units; photographs, sample unit sections and refractories. Represented by: H. J. McCauley, president; J. R. Eves, vice-president and sales manager; C. M. Adams, H. E. Trent, J. V. Calhoun.

R. Y. Ferner Co., Washington. Booth 202.

Latest model of No. 5 high precision locating and jig boring machine demonstrating the use of a universal tiltable table for boring oblique holes or making small box jigs; micro-indicator tubes and supports for measurements of steel balls, rings, blocks, and other metal parts, or as an accurate indicator in the assembling of machine tools or set-up of

work on machines; high precision bench micrometers. Represented by: R. Y. Ferner, representative; Charles T. Ameel, demonstrator; Ernest Stucky, demonstrator; John Cetrule, sales engineer; Nicholas Cetrule, sales engineer; and Peter Seibel, sales engineer.

A. Finkl & Sons Co., Chicago. Booth 162.

Recent developed applications of hot work die steel and drop forge supplies. Represented by: Charles E. Finkl, general manager; Fred Finkl, William Finkl, J. C. Vance, E. H. Graham, J. M. Curley, N. H. Rieger and T. P. Wallace.

Firth-Sterling Steel Co., McKeesport, Pa. Booth 167.

Steels. Represented by: L. Gerald Firth, general manager; D. G. Clark, director of sales; Robert S. Stevick, works manager; G. J. Comstock, director of research; O. K. Parmiter, metallurgical engineer; A. S. Martin, C. G. Thoma, A. E. Barker, O. T. Smith, H. I. Moore, E. T. Jackman, G. A. Jacobs, W. C. Royce, W. J. MacFarland, J. V. Little, R. F. Kimber, F. N. Mead, I. Olsen, Harry Jarvis, Fred Jarvis, G. R. Bunting, J. Johnson, W. A. Ruppel.

J. B. Ford Co., Wyandotte, Mich. Booth 229.

Wyandotte metal cleaners. Represented by: B. N. Goodell, W. M. Cole, George J. Lawrence and W. P. Scott.

Frew Machine Co., Philadelphia. Booth 275.

No. 1 Frew automatic tapping machine and No. 4 motor-driven saw bench. Represented by: George H. Frew, Jr., H. Edwards.

Fusion Welding Corporation, Chicago. Booths 135 and 137.

Fuzon 300-amp. motor generator arc welder in operation and Weldite welding rods, including Green Surfaced rod, Yellow Jacket rod and Blue Streak rod. Will weld up sections of pipe using special method of copper backing weld so as to improve tensile strength of finished weld, and will then pull specimens with Tinius-Olsen tensile strength testing apparatus. Also new portable gas engine driven outfit mounted on wire automobile wheels with pneumatic tires. Represented by: J. B. Green, president; F. B. Toombs, sales manager; E. J. Shuler, D. C. Giles, R. W. Holt and F. A. Green.

G

Gairing Tool Co., Detroit. Booth 165.

Types A, B, C and interchangeable counterbores, types C and F core drills, multiple operation tools with solid and inserted blade, inserted blade boring heads, chucking reamers, grinding fixtures and counterbore sets. Gairing full floating holder and Gairing nose drive reamer are shown for first time. Represented by: E. Gairing, president; C. E. Wyrick, chief engineer; B. O'Meara, D. J. Normoyle and E. T. Gropler.

Gathmann Engineering Co., Baltimore. Booths 259 and 260.

Split ingots of different sizes cast in several types of molds, demonstration of effect of mold designs on solidification, and revised edition of "Big-End-Up versus Big-End-Down." Represented by: Emil Gathmann, president; G. A. Dornin and Mark Gathmann.

General Alloys Co., Boston. Booths 148 and 149.

Q-Alloy heat treating containers; carburizing and annealing boxes, cyanide, lead and salt pots, tubes and retorts, dipping baskets; Q-Alloy and X-ite furnace parts, retorts, muffles, rails, hearths, Hump furnace fixtures; Q-Alloy bars, sheet, forged bolts, fabricated shapes, oil still parts, special valve parts, etc. Q-Alloy Link-Belt chain. Represented by: H. H. Harris, president; W. K. Leach, general manager; George C. McCormick, chief engineer; Fred Blaney, general superintendent; W. R. Blair, R. A. Alger, J. C. Van Arman, R. M. Kirk, Ralph Hare, A. L. Grinnell, J. J. Donovan, W. A. Toohill, A. D. Heath, H. G. Chase.

General Electric Co., Schenectady, N. Y. Booths 53, 54, 55, 56, 57 and 58.

Electric furnaces, electric welding machines. Represented by: C. F. McLoughlin and others.

Gibb Welding Machines Co., Bay City, Mich. Booth 102.

Model 436 HDA seam welder, model 312 automatic welding press, 300 amp. Zeus air cooled arc welder, and type SS-12 spot welder. All except type SS-12 spot welder new additions to line. Represented by: W. H. Gibb, president; C. E. Shearer, advertising manager, and R. D. Thomas, C. M. Rusk, A. M. Taylor and E. P. Larkin of R. D. Thomas & Co., eastern sales agents.

Globar Corporation, Niagara Falls, N. Y. Booth 29.

High-temperature electric furnace equipped with Globar Elements in operation at 2400 deg. Fahr., and furnace equipped with latest type self-cooled terminal. Represented by: A. H. Heyroth, general manager; K. E. Rogers, assistant sales

manager; E. Hediger, plant superintendent, and B. A. Bovee, H. N. Berry, S. Evans and A. Pfau, Jr.

Goodell-Pratt Co., Greenfield, Mass. Booth 209.

Electric drills and precision tools. Represented by: F. W. Pratt, C. L. Jernberg and Lee Fluke.

Goss & De Leeuw Machine Co., New Britain, Conn. Booths 194 and 196.

6-in. multiple spindle chucking machine, threading type, motor drive; and an 11-in. multiple spindle chucking machine, threading type, motor drive; exhibited for the first time. Represented by: Stanley T. Goss, president; Val. C. Hart, J. J. Spring, H. J. Hauck, E. H. Peck.

H

George J. Hagan Co., Pittsburgh. Booths 60 and 62.

Information concerning furnace installations using coal, gas, oil or electricity, together with blueprints and other general operating data. Represented by: R. E. Talley, president; C. F. Cone, A. D. Dauch, J. L. Edwards, J. Sandberg and V. A. Hain.

Halcomb Steel Co., Syracuse, N. Y. Booths 186 and 188.

Airplane motor and starter parts, non-corrosive and heat resisting products, and tool and alloy steels for special purposes. Represented by: F. B. Hufnagel, president; A. T. Galbraith, general manager of sales; S. T. Harleman, assistant sales manager; H. A. Pardee, general manager; H. J. Stagg, S. C. Spalding, J. T. Leyden, H. Barlow and A. Fraser.

Harrington Co., Philadelphia. Booth 261.

Chain hoists, trolleys, and allied products, 1-ton electric hoists. Represented by: Roger Sherron, president; A. M. Harrington, treasurer; R. E. Bishop, sales manager; W. J. Somerset, David Black.

Hartford Machine Screw Co., Hartford, Conn. Booth 246.

Special screw machine products, cap screws, nuts, taper pins and set screws. Represented by: William C. Walsh, L. M. Church and P. M. Mueller.

C. I. Hayes, Providence, R. I. Booth 28.

Improved type Globar furnace for hardening high-speed steel and preheating and high-speed furnaces, equipped with full automatic temperature control and special attachment for

THE IRON AGE will have Booth 183 at the Steel Treaters' Exposition. Representatives of the editorial, advertising and reader service departments will be in attendance, and copies of THE IRON AGE will be on file.

controlling atmosphere in furnace chamber during heating. Represented by: C. I. Hayes, chief engineer, and J. E. Hines, sales manager.

Haynes Stellite Co., Kokomo, Ind. Booth 143.

Stellite wearing parts and method of applying Haynes Stellite to wearing surfaces using oxy-acetylene blowpipe. Represented by: W. A. Wissler, metallurgist; A. V. Harris, G. E. Wilson, A. S. Shiffert.

Heppenstall Forge & Knife Co., Pittsburgh. Booth 195.

24-in. and 10-in. octagonal ingot split through center, showing quality of steels made in company's 18-ton acid open-hearth furnaces; small model shear in actual operation, showing shear knives as manufactured by company. Represented by: C. W. Heppenstall, president; B. B. Weinberg, general sales manager; C. J. Sauer, manager Heppenstall Forge Co.; A. J. Porter, Jr., sales manager Heppenstall Forge Co.; J. A. Succop, D. A. Stuart, G. I. Allen, F. C. Moyer, A. L. Wurster, L. A. Daines, C. G. Singleton, G. O. Desautels and O. W. Mueller.

James H. Herron Co., Cleveland. Booth 61.

Industrial furnaces, including model of company's new continuous conveyor belt furnace, in operation but not heated. Represented by: James H. Herron, president, and Oscar C. Trautman, furnace division engineer.

Hevi Duty Electric Co., Milwaukee. Booth 67.

General line of electric heat treating furnaces. Represented by E. L. Smalley, president; F. A. Hansen, general manager; W. B. Cooley, sales manager.

Hisey-Wolf Machine Co., Cincinnati. Booth 334.

Electric tools as follows: Drills, screw drivers, nut setters, tool post grinders, angle plate grinders, combination ex-

ternal and internal grinders, vertical spindle grinders, bench grinders, floor grinders, bench buffers, floor buffers, combination disk and production grinders and portable grinders. Represented by: H. W. Wallace, J. W. Friedlander, W. J. Holtmeier.

Holcroft & Co., Detroit. Booth 84.

Continuous forging furnaces and continuous heat treating furnaces. Represented by: C. T. Holcroft, president; R. T. Cadwell, vice-president; H. L. Ritts, secretary and treasurer; C. H. Martin, C. E. Barba, C. L. Joy and A. Ruckstahl.

Hoskins Mfg. Co., Detroit. Booth 69.

New type electric heat treating furnace, alloy castings, chromel resistance alloys and thermo-couples and laboratory furnaces and hot plates. Represented by: W. D. Little, sales manager; W. A. Gatevard, F. L. Limmerman, G. L. Price and C. S. Kinnison.

E. F. Houghton & Co., Philadelphia. Booths 121 to 124.

Represented by: George W. Pressell, W. A. Buechner, W. J. Wright, J. Coleman Bentley, E. H. MacInnis, E. C. Barlow, E. W. Bock, C. H. Reiss, C. G. Schultze, H. C. Finck, Fred J. Ramsey, Arthur Jenner, W. I. Schwarz, F. R. Dieterich, D. J. Richards, C. H. Schultz, Raymond W. Justice, John T. Taylor, C. H. Stonerod, J. Weber, H. Seward, F. A. B. Harris, F. V. Armato and John D. Powers.

Hydraulic Tool Works, Philadelphia. Booth 310.

I

Ideal Industrial Machinery, Cincinnati. Booth 153.

An Ideal 36 x 60 in. Star return tumbling barrel with power loader and motor drive; photographs of a number of special installations. Represented by: C. A. Albrecht, George Walsh, N. Ranschoff.

Illinois Steel Co., Chicago. Booths 204 and 205.

Products manufactured by customers from steel produced by company, electric furnace model and photographs of company's alloy mill. Represented by: W. I. Howland, Jr., Assistant general manager of sales; A. L. Meyer, R. Korsan, C. R. Moffatt, R. G. Glass, F. S. Crane, E. Davidson, F. B. Mulvaney, H. McKeown, George Landrus, A. R. Williard, C. A. Parsons, H. G. Daley, C. F. Ramer and F. T. McCue.

Illinois Tool Works, Chicago. Booth 177.

New shear cut gear roughing hob, standard line of metal cutting tools and demonstration of Shakeproof lock washers. Represented by: J. M. Gribble, P. J. Nelson and S. O. Bjornberg.

International Nickel Co., Inc., 67 Wall Street, New York. Booth 219.

Typical applications of nickel and nickel alloys, including nickel steel, nickel cast iron and other nickel-bearing ferrous and non-ferrous alloys. Represented by: F. S. Jordan, sales manager; F. A. Wheeler, assistant sales manager; E. J. Bothwell, nickel department; A. J. Wadhams, manager, development and research department; and P. D. Merica, assistant manager, development and research department; T. H. Wicken-den, Charles McKnight, D. M. Houston, J. S. Vanick, F. B. Coyle, J. W. Sands.

J

Jessop Steel Co., Washington. Booth 237.

Stainless steels and irons, cold-rolled products and bar steel and sheet products. Represented by: S. A. Grayson, president; F. T. H. Youngman, secretary and treasurer; A. G. Lambert, metallurgist; R. M. Paxton, L. R. Samuels, J. C. Dawson and F. T. Morgan.

William Jessop & Sons, Inc., New York. Booth 152.

Represented by: Fred C. A. H. Lantsberry, director of William Jessop & Sons, Ltd., Sheffield; Robert Ross, secretary; G. J. MacQuarrie, A. L. Magilton.

Jones & Laughlin Steel Corporation, Pittsburgh. Booth 230.

Hot rolled and cold finished Jalcas steel and parts made therefrom; various shapes; cold finished bars; light weight channels and junior beams; new section of steel sheet piling. Represented by: W. B. Todd, manager of sales cold finished department; H. W. Graham, general metallurgist; T. C. Ham, Philadelphia district sales manager; C. S. Bradley, general manager of sales; A. A. Wagner, assistant manager hot rolled department; J. D. Allen, J. S. Grumbling, J. H. Flaherty, W. R. K. Scott, metallurgists, and William Miller.

Jones Machine Tool Works, Inc., Philadelphia. Booth 223.

C. M. Kemp Mfg. Co., Baltimore. Booth A. G. A. section.
Various types of burners and furnaces operating from the Kemp automatic gas system; special furnaces to demonstrate the exclusive features of the improved Kemp system; internally fired lead baths, open flame burners and special

display of gas burning under water. Represented by: Elmer B. Dunkak, sales manager; W. M. Ponder, William Hunt.

K

K-G Welding & Cutting Co., Inc., New York. Booth 88.

Style K oxygen and acetylene regulator, and styles A and M welding and cutting torches. Represented by: W. D. Flannery, H. H. Kress and A. W. Carr.

Keller Mechanical Engineering Corporation, Brooklyn. Booths 297 and 298.

Type BL-2416 Keller automatic tool room machine, demonstrating milling of blanking dies and punches from thin metal templates and forming of dies from cement masters; Kello-cater complete unit, with base and overarm and spindle; R-6 Keller cutter and radius grinder, and line of Kellerflex machines. Represented by: P. C. Renno, Henry Schreiber, Harry Reichert and H. P. Loewenberg.

The J. W. Kelley Co., Cleveland. Booth 82.

Machine for washing and quenching metal parts. Represented by: J. W. Kelley, president; H. B. Northrup, secretary, and J. E. Burns.

Kelly Reamer Co., Cleveland. Booth 155.

Line of boring and reaming tools, including single point, two point block type, rigid, adjustable core drills and multiple and shell reamers, also, special tools. Represented by: E. W. Putnam, vice-president and general manager, and Haviland Wright.

Charles F. Kenworthy, Inc., Waterbury, Conn. Booth 255.

Metals that have been bright-annealed in the new Kenworthy Kwik-Brite dry and wet type annealing furnaces; reproductions of other Kenworthy industrial furnaces and metal handling equipment. Represented by: Charles F. Kenworthy, president; Howard A. Kenworthy, designing engineer; Ralph E. Worthington, Selden E. Tracy, Irving W. Chapman.

Keystone Lubricating Co., Philadelphia. Booth 296.

Keystone pneumatic safety lubricating system, showing its adaptability for automatic feed intermittently or continuously; special greases for steel mill work, and lubricants for ball and roller bearings. Represented by: H. A. Buzby, president; C. O. Norstrum, H. M. Ludwick, G. W. Hall, T. B. Little, J. R. Lawrence, S. R. Marshall and F. D. Street.

Kinite Corporation, Milwaukee. Booth 179.

Kinite castings, Kinite weld rod, rolled Kinite bar stock, Patterns for Kinite castings, and metal stampings produced on Kinite dies. Represented by: E. J. Mohr, vice-president; William C. Eakin, William J. Graham, T. A. Moormann and L. L. Clark.

L

Lava Crucible Co. of Pittsburgh, Pittsburgh. Booth 19.

Various types of Super refractories in standard brick, standard tile, special shapes, plastics, cements and graphite crucibles. Represented by: H. E. White, R. P. South, F. South, Jr.

E. J. Lavino & Co., Philadelphia. Booths 81 and 82-A.

Chrome, magnesite and silica refractories, Kromepatch, refractory cement and K-N plastic. Represented by: R. E. Griffith, manager refractories engineering and sales; J. W. Corrison, H. A. Morlock, A. DeMacedo, C. B. Reynolds, J. B. Luckie, H. W. Pigott and P. S. Haserodt.

Leeds & Northrup Co., Philadelphia. Booths 214 and 215 and 192 and 193.

Hump hardening and Homo tempering furnaces consisting of latest Hump method hardening furnaces both for tools and for production work, showing advances in method accomplished during the past year; Homo furnaces for both high and low temperature work will also be shown in operation; pyrometer exhibit consists of L & N potentiometer pyrometers including latest models of automatic controllers, recording controllers, indicating controllers and temperature indicators and recorders; feature of the exhibit will be new indicating controller with visible index and scale over entire width of instrument; optical pyrometers and portable indicators will also be displayed. Represented by: Furnace exhibit: G. W. Tall, assistant sales manager; A. E. Tarr, W. A. Lane and W. C. Roxby; Pyrometer exhibit: Henry Brewer, assistant sales manager; E. B. Estabrook, H. N. McMichael, Earl C. Wood and Carl H. Parker.

E. Leitz, Inc., New York. Booths 281 and 282.

The 1929 model of Leitz Micro-Metallograph with a full line of accessories for micro and macro investigations; the Guthrie-Leitz grinding and polishing machine, a labor and time saving device. Represented by: R. Tvestman, O. Soetbeer, W. Schaaf.

Lincoln Electric Co., Cleveland. Booth 132.

Complete electric arc welding equipment together with a display of various castings replaced by welded steel; also a Linc-Weld motor together with a motor operating under water. Represented by: E. E. Lewis, O. P. Lang, J. W. Kenworthy, E. J. Pfister, D. C. Anderson, A. F. Davis.

Linde Air Products Co., New York. Booths 109, 145 and 146.

Products fabricated by the oxy-acetylene welding process. Represented by: R. W. Boggs, T. C. Fetherston, A. G. Wikoff.

M

Mahr Mfg. Co., Minneapolis. Booth 18.

Operating model of gas fired rotary hearth forging furnace. Represented by: W. G. Barstow, sales manager; C. F. Olmstead, assistant sales manager; A. J. Nordenson, Ray G. White, G. A. Ledebur, E. F. Piea, B. G. Harmon, C. W. Rudolph and A. Tenney.

Marburg Brothers, Inc., New York. Booth 238.

Precision die filing and sawing machines; and samples of work done on these machines. Represented by: Theodore H. Marburg, president; Louis C. Marburg, secretary-treasurer; Francis Marburg.

McCann Harrison Corporation, Cleveland. Booth 25.

Models of two new conveyor automatic furnaces. Represented by: H. P. McCann, president; Edward Busch, eastern sales manager, and Charles L. Stewart, western sales manager.

McGill Metal Co., Valparaiso, Ind. Booth 74.

Various types and sizes of ball bearings, together with several machine parts showing actual application of ball bearings; machine for testing ball bearings under service conditions will be in actual operation. Represented by: Frank R. Schubert, vice-president; W. E. Brownell, treasurer; T. L. Robinson, chief engineer, and William Scrimgeour, Washington district manager.

Metal & Thermit Corporation, New York. Booth 89.

Carbidefree alloys and materials and equipment for Thermit welding, showing improved process of welding with samples of completed welds. Represented by: J. H. Deppeler, H. D. Kelley and R. L. Browne.

Michigan Steel Casting Co., Detroit. Booth 27.

Misco high temperature alloy castings, bars and sheets, including carburizing boxes and tubes, cyanide pots, dipping baskets, rotary furnace retort; also furnace parts, such as rails and plates, and several types of pusher furnace trays and fixtures; Misco alloy chain of several types and Misco alloy rolled bars and rolled sheets. Represented by: F. J. Stanley, general manager; E. D. Flintermann, sales manager; J. D. Corfield, W. E. Broadbelt and J. C. Redmond.

Michigan Tool Co. and Colonial Tool Co., Detroit. Booth 240.

Gear hobs, spline hobs, gear shaper cutters, thread generating cutters, milling cutters, end mills, metal slitting saws, side milling cutters, screw machines and turret lathe tools, spline broaches, keyway broaches and serration broaches. Represented by: J. W. Mull, Jr., general sales manager; T. A. Oleik, E. O. Jenkins and C. M. Conner.

Midvale Co., Philadelphia. Booth 222.

Finish machined forgings, rough steel castings, hardened and ground forged steel rolls, automobile body die with tool steel inserts, Diamond brand tool steel tools and dies, extra high-speed steel cutters, stainless steel bars. Represented by: A. C. Dinkey, president; H. L. Frevert, vice-president; Stuart Hazlewood, vice-president; H. E. Rowe, bar steel sales manager; and others.

Milburn Co., Alexander, Baltimore. Booth 127 and Gas Sec.

Oxy-acetylene equipment, cutting torches, welding torches and regulators. Illuminating gas cutting torches; full line of paint spray equipment; oil burning and preheating equipment and portable carbide lights. Represented by: E. P. Boyer.

Milwaukee Die Casting Co., Milwaukee. Booth 198.

Various types of die castings in aluminum, zinc, lead and tin alloys, and samples which have been polished and plated; also various assemblies to demonstrate application of die castings in connection with the various metal working industries. Represented by: H. F. Schroeder, vice-president, and Charles H. Frantz, sales engineer.

Molybdenum Corporation of America, Pittsburgh. Booth 115.

Molybdenum steels. Represented by: Clifton Taylor, sales manager; William H. Phillips and G. M. Eaton.

Morse Twist Drill & Machine Co., New Bedford, Mass. Booth 212.

Complete line of high-speed and carbon steel drills, reamers, taps, dies and milling cutters; also new forge type high-speed

drill and other special tools. Represented by: F. O. Lincoln, vice-president in charge of sales, and George M. Read.

Mueller Brass Co., Port Huron, Mich. Booth 83.

Brass and copper tubing, brass and bronze nickel-silver rod, brass, bronze and copper nickel-silver forgings, brass, bronze and nickel-silver screw machine parts, and brass and bronze sandcastings. Represented by: W. W. Roach, assistant sales manager, mill products division; B. F. Mueller, assistant sales manager.

N

National Electric Light Association, New York. Booths 182, 218.

A five-reel motion picture film illustrating modern applications of various types of electric furnaces to annealing, carburizing, hardening, vitreous enameling, and steel melting; also an exhibit of various steel parts heat treated in electric furnaces. Represented by: C. E. Russell, C. P. Yoder, D. St. Pierre Du Bose, A. D. Spillman, R. H. Mather.

National Twist Drill & Tool Co., Detroit. Booth 320.

Complete line of twist drills, milling cutters, reamers, hobs, and special tools; what is said to be smallest twist drill in world; new type inserted tooth milling cutter, and new type heavy duty counterbore. Represented by: Harry Butler, assistant sales manager; George Ringstad, E. W. Haines, J. J. Jordan and C. Cornwall.

New Departure Mfg. Co., Bristol, Conn. Booth 190.

Ball bearings.

Norton Co., Worcester, Mass. Booth 51.

Display of alundum and crystolon and refractory ware, such as muffles, hearth plates, crucibles and similar products. Represented by: Harry B. Lindsay, sales manager refractory division.

R. D. Nuttall, Pittsburgh. Booth 135.

Complete new line of reduction gear units and speed reducers. These units all have as features of their design, single helical gears; Timken roller bearings; a rigid, ribbed, three-section case; and a positive splash lubrication system.

O

Tinius Olsen Testing Machine Co., Philadelphia. Booths 269 and 270.

Cloudburst hardness testing machine and equipment for super-hardening steel; Johnson hardness tester for applying Brinell hardness test; Haigh alternate stress testing machine; Herbert pendulum hardness tester; Honda sharpness testing machine for testing cutlery, etc.; Olsen universal testing machine for tension, compression and transverse testing; Olsen direct motor driven production type Brinell hardness tester and hand operated type of machine; latest type of direct motor driven ductility testing machine for sheet metal testing; Olsen polishing machine; various extensometers, including the Olsen-Smith stress-strain recorder; new Olsen-Lundgren dynamic type balancing machine, operated on centrifugal high tension spark principle, and latest Olsen-Lundgren automatic weighing static balancing machine. Represented by: Thorsten Y. Olsen, vice-president; Robert B. Lewis, Jacob Lundgren and Bruce L. Lewis.

P

Page Steel & Wire Co., Bridgeport, Conn. Booth 103.

Page welding wire, featuring the No. 10 package; a flame test, used for comparing various grades of welding wire; photographs and samples of Page bridge wire which was used in the Philadelphia-Camden Bridge and which is now being used in the Detroit International Bridge and the Mount Hope, R. I., bridge. Represented by: W. T. Kyle, L. S. Lankton.

Peerless Machine Co., Racine, Wis. Booth 278.

High-speed metal sawing machines. Represented by: Charles Rasmussen, president; I. M. Ward, vice-president, and A. H. Goetz, sales manager.

Pittsburg Instrument & Machine Co., Pittsburgh. Booth 284.

Precision Brinell testing machine, power-driven Brinell testing machine, hand-operated Brinell testing machine, Brinell microscopes, depth indicator for Brinell testers, sheet metal tester, metallographic grinder, and proving ring for checking Brinell machines. Represented by: Paul Kammerer.

Porter-Cable Machine Co., Syracuse. Booth 333.

Porter-Cable Hi-speed production lathe; Porter-Cable heavy duty universal milling attachment; Syracuse horizontal disk sander, type D-3; Syracuse two belt sander and grinder, type 2B3; Take-About and Super Take-About hand sanders

with bench stands; Porter-Cable portable electric hand saw. Represented by: K. O. Ditmars, D. J. Ridings.

Horace T. Potts & Co., Philadelphia. Booth 166.

Tools and dies made of various grades of tool steel. Represented by: Arthur L. Collins, Henry R. Wimmersberger, Maurice H. Felty, and L. D. Willis, A. W. Ainsworth, Guy P. Bible, Thomas C. Potts, Charles William Potts, J. J. Drexler, Claude Mengel, Stanley L. Bateman, W. H. Dunlap.

Production Machine Co., Greenfield, Mass. Booth 210.

Polishing and punching machines. Represented by: A. H. Behnke, vice-president.

Pyrometer Instrument Co., New York. Booth 151.

Pyro radiation pyrometers; Pyro optical pyrometers; Pyro immersion pyrometers; Pyro surface pyrometers. Represented by: Richard C. Jordan, F. D. Heidorn, O. Raab.

R

Reeves Pulley Co., Columbus, Ind. Booth 176.

Reeves variable speed transmission, unit for obtaining infinite variable speed control and used extensively in connection with continuous heat treating furnaces; improved design of Reeves transmission, embodying all recent improvements. Represented by: C. L. Irwin, T. A. Bergen and Philip C. Talbot.

Charles Reines, Brooklyn. Booth 17A.

George P. Reintjes Co., Kansas City, Mo. Booth 15A.

Display of Reintjes flat arch brick for use in high temperature furnaces; especially where large cross section of the gas duct is required and where head work is limited; also truss arch shapes. Represented by: George P. Reintjes, S. Skouse, John Hawkins.

Riehle Brothers Testing Machine Co., Philadelphia. Booth 291.

50,000-lb. vertical screw testing machine, universal type with new auto type gear box unit; Vickers diamond hardness tester; proving rings, and pamphlets and photographs. Represented by: F. Buckingham, superintendent; George Lawrie and A. Fuller Riehle.

Stanley P. Rockwell Co., Hartford, Conn. Booth 80.

Model LA (laboratory) Rockwell Dilatometer; Model RA (remote control) Rockwell Dilatometer on model furnace; also Rockwell Dilatometer equipment in booth of E. F. Houghton & Co., and in booth of Peoples Gas Light & Coke Co. Represented by: Stanley P. Rockwell, president and treasurer; Warren D. Fuller, vice-president; Raymond W. Woodward, secretary; William A. Stumpf, Kenneth Stumpf.

W. S. Rockwell Co., New York. Booth 63.

Illustrations, drawings and technical data on industrial furnace equipment, and special types of blast gates for controlling air lines. Represented by: M. L. Hollister, R. M. Atwater, J. A. Doyle, C. D. Barnhart, H. J. N. Voltmann.

John A. Roebling's Sons Co., Trenton, N. J. Booth 91.

Welding wire. Represented by: J. L. Unsworth, A. L. Miller, A. E. Gaynor and E. T. Bertram.

The Roessler & Hasslacher Chemical Co., New York. Booth 262.

Cyanide case hardening mixtures; cyanegg; copper cyanide; cadmium oxide; chromic acid; sodium stannate, and R & H drawing salts. Represented by: W. M. Gager, C. H. Proctor, W. J. Schneider and S. C. Harris.

Rotor Air Tool Co., Cleveland. Booth 22.

Rotor type D-1 grinder, standard; Rotor type D-1 grinder, high production model, using Redmanol, bakelite and rubber bonded wheels, 6 in. size, load speed 5000 r.p.m.; D-3 grinder, standard; D-3 grinder, high production model, a new model, using rubber bonded, bakelite and Redmanol wheels, 8 in. size, load speed 4000 r.p.m.; Rotor sander; E-1 drill; E-2 drill; E-5 drill, 29/32 in.; E-5 drill, 1 1/4 in. Represented by: H. P. Bailey, president; K. L. Pohlman, vice-president; G. O. Singer, F. R. Moore, L. K. Berry, F. W. Hammer.

S

George Scherr Co., New York. Booths 180 and 181.

Schuchardt & Schütte new size No. 10 quick-change gear hobber, special worm miller, automatic hob grinder, universal relieving lathe, small gear hobber with fully automatic cycle of operation; full line of Carl Zeiss optical measuring instruments, including a new 40 in. optical precision measuring machine. Represented by: George Scherr, president; Fritz König, secretary; George VandePlanck, George Kaner.

Sentry Co., Taunton, Mass. Booth 64.

No. 1 Model H small carbon steel hardening furnace, No. 1 Model HS small high-speed steel hardening furnace, No. 1

Model L 8 x 16 in. pot furnace (first time exhibited). Represented by: A. A. Harvey, sales manager; P. B. Crocker, treasurer.

Shenango-Penn Mold Co., Dover, Ohio. Booth 227.

Centrifugally cast bronze in various diameters and lengths made of standard and special compositions in the rough, semi-finished and finished in the form of solids, tubes, bushings, sleeves and liners; solids and tubes in the rough, bushings, sleeves and liners in the rough, semi-finished and finished. Represented by: H. S. Bradley, president; G. L. Col-lard, vice-president; F. A. Demms, treasurer; H. M. Wilson, secretary; J. P. Jefferis, manager; H. H. Zollar, P. H. Jef-feris, Rafford Pitt, C. R. Hayes.

Shore Instrument & Mfg. Co., Jamaica, N. Y. Booth 236.

Shore's scleroscopes, C-2 pneumatic and D dial types for test-ing the hardness of metals and materials; durometer and elastometer, improved, for testing rubber and plastic material for density, hardness and elasticity; optical pyrometers, A and B pyroscopes, for heat treating and foundry tempera-tures; Localcase and Localhard, for localizing, carburizing and hardening of steels; the Monotron hardness indicator, latest addition to company's line of precision testing appara-tus. Represented by: F. G. Kendall, sales manager; J. M. Kendall.

Siewek Tool & Die Co., Detroit. Booth 287A.

Small tools and dies.

Simonds Saw & Steel Co., Fitchburg, Mass. Booth 150.

Complete line of circular and band saws for cutting wood or metal; also hack saw blades, files, machine knives and high-speed, carbon and special tool steels; also a new inserted tooth metal cutting saw, developed this year by Simonds engineers, this new saw has a high-speed steel tooth especially shaped for faster cutting with a minimum of power. Represented by: C. R. Pafenbach, steel sales manager; H. B. McDonald, metal saw superintendent.

Sleeper & Hartley, Inc., Worcester, Mass. Booth 231.

No. 2 universal collar, with latest improvements. Represented by: Patsy Mignacca.

David H. Smith & Sons, Inc., Brooklyn. Booth 285.

Sonntag quadruple punch, angle, bar and plate shear notcher, with rolled steel plate frame construction, in two sizes; special new features are new type die blocks which allow clear use of all throat space, also notcher built-in as an integral part of the machine. Represented by: David H. Smith, chairman of the board; Austin D. Smith, president; Dudley J. Smith, vice-president; W. H. Krapohl, manager machinery dept.

Smith Welding Equipment, Eastern Corporation, Philadelphia. Booth 140.

Welding equipment.

Southern Manganese Steel Co., St. Louis.

Assortment of heat and corrosion-resistant alloys in the chrome, nickel series produced under the trade name of Fahrallloy. Represented by: E. F. Mitchell, sales manager; W. M. Black, J. T. Norris, D. M. Powers, F. A. Fahrenwald, A. W. Daniels, general sales manager.

Southwark Foundry & Machine Co., Philadelphia. Booth 217.

One 60,000-lb. testing machine; McCollum-Peters electric telemeter; Whittemore strain gage; and Huggenberger Tensometer. Represented by: H. A. Weaver, general man-ager, Steel City Testing Laboratory; Francis G. Tatnall, manager, testing equipment division, Southwark Foundry & Machine Co.

Spencer Turbine Co., Hartford, Conn. Booth 16.

Spencer Turbo-compressors for supplying air in connection with oil and gas burning industrial furnaces, foundry cupolas, etc. Represented by: S. E. Phillips, president; F. A. Wright, F. D. Bailey, O. J. Dingee.

Standard Alloy Co., Inc., Cleveland. Booth 19A.

Standard alloy carburizing boxes, lead pots, normalizing and pack heating furnace disks and spacers, enameling burning racks, heat resisting conveyor chain grates, furnace trays and shoes, chimney pots, furnace parts and miscellaneous heat and acid resisting castings covering in general the heat treating and chemical field. Represented by: Frank F. Jack-son, vice-president; Harvey M. Smith, sales director; Emer-son M. Williams, treasurer; J. H. Williams, secretary; Charles D. Cutting, Herbert A. Cutting.

Standard Tool Co., Cleveland. Booth 199.

Carbon and high-speed twist drills, reamers, milling cutters, taps, chucks. Represented by: W. P. Ross, sales manager; H. H. Polk, D. M. Dorsheimer, Jr., F. T. McGuire, C. C. Buck.

L. S. Starrett Co., Athol, Mass. Booth 248.

Mechanics' tools. Represented by: D. Findlay, sales manager; A. H. Starrett, master mechanic; D. Moffat, H. E. Masters.

Steel Casting Development Bureau, Philadelphia. Booths 316 and 314.

Steel castings of superior physical properties developed by care-fully controlled heat treatment; panels illustrative of the normal, annealed and heat treated structures of plain car-bon steels and special alloy steels, physical test specimens, photomicrographs. Represented by: George Batty, research director, and representatives of member companies.

Steel City Testing Laboratory, Detroit. Booth 217.

Style A hand Brinell machine; Type O3 power operated Brinell machine, latest model with chain drive; Type P portable hardness testing hammer; SKW adapter for scleroscope; Type R2 sheet metal tester; Southwark-Emery 60,000 lb. capacity universal testing machine; Brinell microscopes. Rep-resented by: H. A. Weaver, general manager.

Sullivan Machinery Co., Chicago. Booth 336.

WG-6 8 x 6 in. gas compressor, belt-driven from electric motor; WL-44 240 cu. ft. 4-cylinder vertical compressor (to furnish air to exhibitors). Represented by: H. C. Sargent, E. F. Pie.

Surface Combustion Co., Toledo, Ohio. Booth A. G. A. section.

Heat treating furnace with two stage burners and automatic temperature control for temperature range of 1200 deg. to 2000 deg. Fahr.; small oven furnace for high-speed steel treating; standard forge furnace; varnish burner; small oven heat treating furnace; circular cyanide hardening furnace; aluminum melting furnace; crucible brass melting furnace. Represented by: F. W. Manker, vice-president; C. B. Phillips, vice-president; C. A. Blesch, W. T. Fulton, Philip Kriegel, F. C. Starr, F. H. Trembley, K. H. Cree, E. A. Weaver.

Swind Machinery Co., Philadelphia. Booth 206.

Machine tools.

T

R. D. Thomas & Co., Philadelphia. Booths 100 and 102.

Westinghouse arc welders, T-grid furnaces, Gibb press and seam welders, Gibb spot welders, Hevi-Duty electric furnaces, Wanamaker arc welding electrodes. Represented by: R. D. Thomas, president, A. M. Taylor, C. M. Rusk.

Thwing Instrument Co., Philadelphia. Booth 276.

Thwing model 28 recorder, exhibited for the first time; Thwing radiation pyrometers (latest developments in this type of pyrometer including the new tube for permanent mount-ing); Thwing A5X pyrometer for non-ferrous metal tempera-tures; Thwing inspector's calibrating and checking set; Thwing electrical resistance thermometers. Represented by: C. B. Thwing, president; E. J. Albert, secretary and general manager; P. P. Bourquin, superintendent; A. S. Hall LeRoy Driscoll.

Timken Steel & Tube Co., Canton, Ohio. Booths 232 and 234.

Reception space. Represented by: A. J. Sanford, W. H. Wiewel, Robert Atkinson.

Torchweld Equipment Co., Chicago. Booth 176.

Gas welding and cutting equipment, improved cutting torches, Torchweld safety pressure regulators, acetylene generators, welding accessories and supplies. Represented by: W. A. Slack, president; R. M. Smith, assistant sales manager; M. N. Pike, L. R. McKean.

Transportation Engineering Corporation, Brooklyn. Booth 100.

Full line of Wanamaker coated electrodes and Rex electrodes, together with arc welding accessories. The Wanamaker coated and Rex electrodes are made in various diameters adapted for various classes of welding and in varying analyses to conform as closely as possible to the parent metal to be welded. Represented by: F. V. McGinness, president; H. W. Stortz, vice-president.

Harold E. Trent Co., Philadelphia. Booth 71.

Electric pot and trough type heat treating furnaces for lead, salt or cyanide; direct heat electric furnaces for steel treat-ing; melting pots for babbitt, solder, tin, etc.; and other Trent industrial equipment. Represented by: H. E. Trent, president; J. V. Calhoun, sales manager; C. M. Adams, J. R. Eves, and others.

Tuthill Pump Co., Chicago. Booth 277.

Full line of high grade rotary pumps, from ½ g.p.m. to 200 g.p.m. for use in heat treating departments or for general plant use in handling of oils for all uses, supplying coolant on machine tools, and thousands of plant uses. Represented by: O. L. Bock, H. C. Osborne.

U

Una Welding & Bonding Co., Cleveland. Booth 138.

Represented by: E. R. Alexander, president; E. W. Kronbach, general manager; A. A. Probeck, vice-president; L. S. Bur-gett, chief engineer; J. B. Austin, research engineer.

Union Mfg. Co., New Britain, Conn. Booth 239.

Lathe chucks; Union-Red roller bearing hoist, a new line. Represented by: H. H. Wheeler, treasurer; E. I. Stevens, G. V. Murphy.

Universal Steel Co., Bridgeville, Pa. and Cyclops Steel Co., Titusville, Pa. Booth 164.

Sheets of carbon and alloy steels, showing hack saw, gin saw, hand saw, circular saw, cutlery, magnet, high-speed, agricultural disk and soft center steels; bars of carbon, alloy and high speed tool steels, ball race, magnet, file and valve steels; sheets and bars of heat resisting and non-corrosive steel and alloys; cold-drawn bars and cold-rolled sheets; finished products from the foregoing; new die steel for hot forming and heading. Represented by, Universal Steel Co.: J. O. Rinek, assistant general manager; U. G. Miller, general superintendent; Frank Garratt, sales metallurgist; H. M. German, metallurgist; H. Copp, Jr.; Cyclops Steel Co.: Charles Evans, vice-president and general manager; F. F. Harter, F. H. Cooke.

Unishear Co., New York. Booth 207.

Mighty Midget Unishear, Model A-14 Unishear, Model O-54 Unishear, Model A-10 Unishear. Represented by: H. J. Heller, vice-president; George B. Shiras, sales manager; H. H. Gildner.

V

Vanadium-Alloys Steel Co., Latrobe, Pa. Booths 156 and 157.

High speed, alloy and tool steels; fractures of same showing the effects of different heat treatments; tools showing typical applications of these steels; cold-drawn, high-speed, alloy and carbon tool steels with products of same. Represented by: Roy C. McKenna, president; Floyd Rose, vice-president; L. D. Bowman, works manager; J. P. Gill, metallurgist; R. B. George, M. W. Caruthers, W. R. Mau, F. W. Potts, D. L. Bardes.

Vanadium Corporation of America, New York. Booth 257.

Ferro vanadium, silico vanadium, aluminio vanadium, vanadium metal (95 per cent), ferrochrome, ferro silicon, Alsifer; vanadium steel railroad springs, valve springs, carbon vanadium automobile crankshafts, forgings, etc. Represented by: Ward A. Miller, vice-president; B. D. Saklatwalla, vice-president, J. A. Miller, Jr., general manager of sales; G. A. Laub, assistant general manager of sales; H. T. Chandler, assistant to president; N. Petinot, assistant to president; G. L. Norris, chief metallurgical engineer; Jerome Strauss, chief research engineer; C. N. Dawe, C. B. Woodworth.

Van Dorn Electric Tool Co., Cleveland. Booth 292.

Standard line of universal tools, such as drills, grinders, electric screw drivers, electric wrenches and electric hammers, as well as reamers. Represented by: F. H. Zulauf, vice-president and general manager; Lyman H. Bellows, general sales manager; Louis Charnicky, S. S. Waters.

Vulcan Crucible Steel Co., Aliquippa, Pa. Booth 224.

High-speed, alloy and carbon tool steels and special steels. Represented by: S. G. Stafford, president, R. M. Kelso, A. D. Beeken, Jr., S. A. Stafford, W. H. Norris, Norman C. Einwechter, C. E. Conway, W. F. Kline.

W

Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa. Booths 133, 135 and 137.

Complete line of portable electric welders, one in operation; sectionalized pot-type electric furnace; double Nuttall gear unit; Nuttall mill unit, and other displays of Nuttall gears. Represented by: T. C. Kelley, W. W. Reddie, A. M. Candy, A. P. Lesnick, William Norberg, G. H. Koch, Mark Dawson and P. H. Grunnagle.

Wheeling Mold & Foundry Co., Wheeling, W. Va. Booth 299.

Section of chilled iron sheet mill roll, section of alloy steel heat treated roll; section of Wheeling metal roll, alloy steel heat treated forging die, and alloy steel hammer ram. Represented by: H. E. Field, president; E. A. Balsley, vice-president; R. C. Heaslett, Craig Adair.

Wheelock, Lovejoy & Co., Inc., Cambridge, Mass. Booth 147.

Hy-ten alloy machinery steels; Whelco tool steels in application to special parts, and replica of open-hearth furnace in operation. Represented by: A. Oram Fulton, president; F. H. Lovejoy, vice-president; E. C. Bartlett, S. W. Parker, C. R. Jenks, A. L. Knight, A. F. Erikson, H. B. Briggs, H. M. Foster, G. S. Longley and T. W. Knight.

Whitney Metal Tool Co., Rockford, Ill. Booth 273.

New 18 in. and 24 in. throat depth ball bearing punches. Represented by: Gus Jensen and John Jensen.

Wiedemann Machine Co., Philadelphia. Booth 236-A.

Photographs of plant and various parts. Represented by: Theodore Wiedemann, president; Henry Bockrath, vice-president; Joseph H. Bockrath, secretary, and Otto F. Wiedemann.

Edwin L. Wiegand Co., Pittsburgh. Booth 71.

Complete line of Chromalox products, such as strip heaters, space heaters, immersion units, complete electric heaters, automatic electric water heaters, etc. Represented by: Ernest N. Calhoun, sales manager; C. M. Adams, H. E. Trent, J. V. Calhoun.

J. H. Williams & Co., Buffalo. Booth 226.

Drop-forgings, for automobiles, airplanes, etc.; drop-forged wrenches from chromium-molybdenum and plain carbon steel; monkey wrenches, bull dog wrenches, drop forged clamps, crank handles, eye bolts and hoist hooks. Represented by: J. C. Scanlon, general sales manager, special forgings; Philip Rigby, Walter Linde.

Wilson-Macaulen Co., Inc., New York. Booth 78.

Rockwell hardness testers, indicating pyrometers, recording pyrometers and automatic temperature controllers. Represented by: G. B. Duff and William Printz.

Wilson Welder & Metals Co., Hoboken, N. J. Booth 95.

Model S 200-amp. welding machines, one driven by electric motor, and other by gas engine, in operation; also Wilson Color-tipt welding wire and other accessories. Represented by: T. B. Hasler, president; E. D. Bransome, vice-president; Alexander Churchward, technical manager; J. A. Quarumby, sales manager; Harry Schemm, demonstrator, and representatives from Joseph T. Ryerson & Son, Inc., and Peter A. Frasse & Co., Inc., distributors.

Y

Young Brothers Co., Detroit. Booth 233.

Electric laboratory ovens; working models of continuous conveyor ovens; photographic display; and descriptive literature of various types of ovens. Represented by: George A. Young, president; R. B. Reed, sales manager.

Z

Ziv Steel & Wire Co., Chicago. Booth 225.

Various tools and dies made from company's tool steels, and Darwin & Milner, Inc. tools and dies made from Neor and Cobaltrom PRK-33 steels. Represented by: N. J. Hyslip, vice-president; A. F. Brunck, general sales manager; V. F. J. Tlach, president, Darwin & Milner, Inc.; John R. MacCracken and H. L. Harrison of Darwin & Milner, Inc.

British Methods of Forging Large Seamless Drums

METHODS used by John Broun & Co., Sheffield, England, to manufacture forged drums for extra heavy pressures were described in a recent paper by H. E. Yarrow before the British Association for the Advancement of Science. Mr. Yarrow recommended the use of circular drum-ends or headers, which might be riveted on if the pressure was to be less than 600 lb. per sq. in., but should be closed in without seams for higher pressures.

To secure sound material in the actual forging, sufficient material is removed from the top of the ingot. When cold,

the ingots are cut to length and a hole of considerable diameter is trepanned through them.

In the forging process the ingot is both expanded and drawn, and thus is worked both circumferentially and longitudinally. The closed-in end drums are bored after the completion of the forging process, and when cut to length are closed in, particular care being taken to insure that the deformation of the material takes place gradually. The forgings are then heat treated so that the physical properties of the boiler ends are similar to the rest of the forging.

Precision Heat Treatment for Gears

Six-Zone Annealing, Controlled to 7 Deg., Necessary for
Maximum Machinability—Oil for Quenching
Presses Held to 3 Deg., Plus or Minus

AS outlined in former articles, the heat treating equipment installed at the plant of Dodge Brothers, Inc., Detroit, is placed in two plants, No. 1 for treating machined parts, and No. 2 for treating rough forgings. Units are installed for several general classes of operations: (a) normalizing, quenching and drawing of forgings¹; (b) carburizing,² quenching and drawing; (c) cyanide hardening and drawing; (d) heating in electric furnaces, quenching and drawing; (e) lead hardening. Sometimes combinations of these, such as electric furnace heating and cyaniding, are met.

The present article will describe operations on transmission and ring gears. The former are upset from bars analyzing 0.48 to 0.53 per cent carbon, 0.80 to 1.00 chromium, and 0.15 vanadium. The heat number is stamped

on each gear, and its identity is preserved through to the finished product.

Exact Annealing Gives Maximum Machinability

Dodge transmission gears are annealed in a double tunnel furnace of the pusher type heated by electricity and built by the Electric Furnace Co. The chambers are 46 ft. long, 40 in. wide and are separated by a 12-in. fire wall. The capacity is 1250 lb. per hr. per chamber. The work moves through the chambers in opposite directions, so that the charging end of one tunnel is the discharge end of the other. This permits hot trays to be reloaded and recharged without the necessity of trucking them back to the opposite end.

Operation is automatic and intermittent. A pusher moves the tray into the furnace at a predetermined time interval (approximately 12 min.) and simultaneously dis-

¹ See THE IRON AGE, Aug. 16, page 389.

² See THE IRON AGE, Aug. 30, page 513.

Fig. 1.—Side View of Furnace Annealing Transmission Gears. Work pushed through in trays. Equipment at side includes automatic temperature control, and automatic control of circulating air for cooling zone

charges a tray at the far end. Trays are of alloy steel, 12 x 36 in. in dimensions and are carried on three alloy roller rails. The load is approximately 200 lb. per tray.

The furnace is divided into six zones. First there is a heating zone, then a holding zone and after that a cooling zone, which is followed by three holding zones. Work in the cooling zone is cooled by forced air delivered by a blower through four pairs of cooling ducts made of chrome iron sheets that are located over and under the trays. Thus no air is blown into the furnace hearth. The ducts carry it across and heat is absorbed through the walls of the duct. Each duct has a hand control valve. A common mani-

temperature is electrically controlled by Leeds & Northrup recorders. Temperature is held within a range of $7\frac{1}{2}$ deg., plus or minus.

It is necessary in this furnace to produce and control the above cycle to obtain the desired microstructure, which is coarse lamellar pearlite with some massive ferrite without any sorbite or spheroidal cementite. Experience in the department has shown that this structure gives smoother finished gears from the gear shapers. All annealed blanks are held within limits of 187 to 207 Brinell.

After the transmission gears are annealed in the above described manner for best machinability, they go through

Fig. 2.—Double-Hearth Hardening Furnace for Ring Gears. Hearth bottoms are rollers, ratchet-driven through bars, cranks, and rod to eccentric on top of furnace

fold is run from the fan to the first four ducts and a second manifold to the second four ducts. The air supply of each of these manifolds is automatically controlled from a thermocouple inserted between the first and second ducts in the furnace over the trays, as indicated in one of the accompanying illustrations.

Power and time temperature cycles on this annealing furnace are: Heating zone, 150 kw., 2 hr. to 1600 deg. Fahr.; holding zone, 70 kw., 2 hr. at 1600 deg. Fahr.; cooling zone, no power, 1 hr. 15 min. cooling to 1330 deg.; first holding zone; $1\frac{1}{2}$ hr. at 1330 deg., 10 kw., top and bottom elements; and second and third holding zones 2 hr. 50 min., 15 kw., top and bottom elements. Work enters these holding zones at 1320 to 1330 deg. and is discharged at 950 deg.

Work therefore remains in the furnace 9 hr. 35 min. There is a separate thermocouple for each zone and the

the various machine operations and are then ready for hardening.

Transmission Gears Hardened from Cyanide Pot

All Dodge transmission gears are hardened by a so-called duplex method, a combination of both electric furnace and cyanide treatment. Equipment for this work includes six 105-kw. rotary furnaces and six electrically heated 30-kw. cyanide pots. Four of these pairs were supplied by the American Metallurgical Corporation and two by the Electric Furnace Co. An oil quenching tank of the conveyor type is provided between each pair of furnaces and the cyanide pot is located near the discharge door of each furnace.

The rotary hearth furnaces are 10 ft. $7\frac{1}{2}$ in. in diameter, the hearth is 18 in. wide and the hearth area 27 sq. ft. On it are 20 stations, 18 of which are active. Each carries

*Fig. 3—(Above) Discharge End of Ring Gear Furnace. Battery of six quenching presses at right
Fig. 4.—(Below) Inspection of Finished Ring Gears for Flatness, Roundness and Hardness*

two fixtures of gears, each fixture holding three or four flat gears, or two clutch gears. Production varies from 450 to 750 lb. per hour.

Gears are kept in the furnace from 48 to 54 min. At the predetermined time cycle, i.e., $2\frac{1}{2}$ min., the hearth moves forward one station, a motor operated door opens automatically, the furnace tender removes the hot fixtures, places them in the cyanide pot and closes the furnace door. Gears are left in the pot exactly one minute and then removed to the old quenching tank. Time for holding the work in the cyanide pot is indicated by a signal light that burns one minute.

The furnace temperature is 1485 deg. Fahr. and that of the cyanide pot 1490 deg. The latter serves the dual purpose of cleaning off any scale and imparting a slight skin hardness. Oil in the quenching system is circulated through Griscom-Russell coolers and is maintained at a temperature of 90 to 110 deg. Fahr. At the front end of each tank is a propeller to promote a better circulation around the hot gears.

From the quenching tank the gears are suspended from a conveyor that passes through a washing machine and returns them to electrically heated drawing tanks. There are two of these tanks, each 5 ft. 10 in. wide and 19 ft. 6 in. long, containing 1000 gal. of oil. The gears, carried in wire baskets, are kept in these tanks for 45 min. at 400 deg. Fahr., after which they are hung on another overhead conveyor that carries them through a washing machine built by the Detroit Sheet Metal Works. They are then taken from the baskets and given a light wire brushing, and inspected for hardness. Gears are held to scleroscope limits of 72 to 76. It is stated that more than 1250 gears will pass before one rejection is encountered.

Each oil drawing tank is heated by twelve 5-kw. Westinghouse units ranged along the sides of the tank. Baffles are located in front of each heater and a propeller in the end of the tank forces the oil through the center of the tank along the conveyor and back inside the baffles past the heaters.

Ring Gears Oil Quenched in Press

Rear axle ring gears for Dodge motor cars, after forging, are annealed at 1700 deg. for 3 hr. in continuous electric furnaces (described on page 390, issue of Aug. 16), one hour of which is at heat, and then cooled in boxes. The next operation is machining, after which they are carburized in a counterflow furnace and box cooled, as shown on page 513, issue of Aug. 30. This produces a case depth of 0.035 in. to 0.040 in. They are then hardened in a roller type hearth furnace (Fig. 2) with a temperature range of 1430 deg. to 1440 deg. in the heating zone, being kept

in the furnace 42 min., quenched in oil in a Gleason press, and drawn 40 min. at a temperature of 300 deg. Gears are then cleaned in a washing machine built by the G. & M. Industrial Equipment Co., Detroit. Hardness inspection follows and then an inspection for flatness and roundness. (Fig. 4.) Straightening is done if necessary. File and scleroscope tests on the finished gear must approach a file hardness and within a scleroscope hardness of 80 to 90.

Two roller hearth furnaces built by the Electric Furnace Co. are used for hardening the ring gears. Each has two tunnels, one above the other. The gears are propelled through the furnace by 30 rollers that form the hearth and are driven outside the furnace walls by ratchet and an eccentric through a speed reducer from the motor located on top of the furnace. This drive is shown at the right center of Fig. 2.

These furnaces are 9 ft. 2 in. long and 24 in. wide and are arranged to bring the gear up to heat in 30 min. and to soak for 12 min. In the first zone of each chamber 23 kw. of energy is required, and 12 kw. in the second zone. Each tunnel delivers 28 gears an hour. A signal flashes 15 sec. before the gear reaches a stop at the discharge end. The loading end shown in Fig. 2 is arranged with trap doors and guides so that the gears must maintain a staggered position one inch apart. Six Gleason quenching presses (Fig. 3) with dies of improved design are located in front of the furnaces. Oil is delivered to the gears in the press at the instant of quenching at 30 lb. pressure through 2-in. lines.

Oil Circulating Systems

Oil for quenching ring gears is carried in a 1000-gal. underground storage tank and is pumped by a centrifugal pump driven by a 50-hp. motor at 40 lb. pressure at the pump and 30 lb. pressure at the quenching machine. It passes through a Griscom-Russell tubular cooler that holds the pressure constant. Water for cooling the oil is taken from a cooling tower. The oil temperature is controlled automatically by Tagliabue air-operated controllers and diaphragm motor valves. These valves are opened and closed by air pressure. Air is admitted or allowed to escape by a Griscom-Russell controller.

Oil for quenching the transmission gears is stored in a 5000-gal. tank, and is pumped and controlled by a similar unit. The control of the oil temperature is very close at the Dodge plant, being within 3 deg., plus or minus, in the ring gear unit and 10 deg., plus or minus, in the transmission gear unit. The capacity of the ring gear unit is 700 gal. of oil per min., and that of the transmission gear unit 600 gal. per min.

Metal Fuselage Becoming More Popular in European Aircraft

A BRIEF comment on the annual exhibition of aircraft held in the Grand Palais, Paris, was printed in *Engineer* for July 20. From this it is gathered that many countries sent planes, and while there is a noticeable trend toward uniformity in the main details of design, it is obvious that each country is developing a type primarily adapted for its needs. For instance, civil aviation in England and Italy desires overseas communication; Germany represents the other extreme in covering its own territory.

"Bristol" machines particularly show sound mechanical construction, in pleasing contrast with the artifice of punching holes and stressing with wires in order to secure lightness which many machines at one time displayed. All the Continental machines which may be regarded as illustrating progress are noted for their clean appearance, and most of the French airplanes are now made with stiffer sections instead of with very small angles riveted and stressed with wires. The old and rather flimsy construction has prac-

tically disappeared. It was noticeable that the majority of machines shown were built almost wholly of metal.

Another feature is the increasing use of reduction gears between the engine and propeller. At one time it was feared that such mechanism would prove unreliable, but the type of gear usually employed has stood up to the work, and is now used on a number of the most prominent machines. There is, consequently, a tendency to adhere to the two-bladed propeller, and this also is often metallic.

The rotary engine has practically disappeared, and the question whether the straight engine or the radial type engine is to be preferred, seems to be answered in favor of the latter. There do not appear to be many cases of straight engines being substituted for the radial type air-cooled engines, and the latter were more strongly represented at the show than formerly, but the Germans use both types, and in Italy the V and W-shaped engines appear to retain their popularity.

Numerous Uses for Bessemer Steel

Cannot Be Duplicated by Open-Hearth Grades for Screw Stock—
Makes Excellent Pipe, Bolts and Implement Bars

BY JOSEPH R. MILLER*

IN these later years Bessemer (that is, acid Bessemer) steel has been passing—for in one after another of the purposes for which it formerly was used it has been replaced by open-hearth steel, and in one use after another it has failed in workability and service.

There are three reasons for this situation. First, open-hearth steel with its control of the phosphorus content is available in increasing quantities, and this, of course, is the greatest of the three reasons. Second, service requirements have grown more and more severe; there are more cold operations and there is greater severity in fabricating methods. Third, Bessemer ores of low phosphorus content are becoming scarcer and the ores now available yield a product somewhat higher in phosphorus than was the case in the old days, when Bessemer steel had a pretty good quality reputation.

Open-hearth steel properly made can be a very good quality material. With the control over phosphorus and the more leisurely method of oxidation, and an opportunity to do more or less complete deoxidizing and refining before tapping, open-hearth has a distinct advantage over Bessemer steel from the standpoint of quality and adaptability. With this better material available, the demands of the steel user and fabricator became more severe. And as men could get steel that would stand it, uses and operations came into vogue that were too severe for Bessemer steel. In this way many people have grown to think it inferior and, like anything else that is peculiar, there are certain things for which it should never be used.

Old-Time Bessemer Steel Was Better

When Bessemer steel was used without much limitation for structural sections and rails it was undoubtedly a better product than now, in other ways beside that of lower phosphorus content. Old Bessemer men maintain that the earlier blast furnace practice produced a better iron for Bessemer operations. It is also likely that the older Bessemer men were more skillful, in the art of blowing, in bringing out the proper quality in the blown metal, aided perhaps by peculiar qualities of virtue in the iron, as they say. Be this as it may, the present problem in the use of this product must take account of it as it is, for any trend for betterment cannot be expected.

In spite of these considerations, there are certain purposes for which Bessemer steel is better fitted than open-hearth steel, and there are many uses to which the two are equally adaptable; and it is in these uses and for the convenience of the duplex process that the Bessemer plant survives.

The qualities which give Bessemer steel value for certain definite uses or combinations of uses are three:

- a. Machineability.
- b. Weldability.
- c. Stiffness.

These qualities are greater in Bessemer steel and they can be combined in unusual ways so as to produce desirable results. For instance, we can make a weldable steel that is easily machineable, while any weldable steel made in the open-hearth furnace will not be particularly easy to

machine, and especially to thread. This makes the Bessemer very good as pipe steel and especially for the internal threads of pipe couplings. This also makes it successful for bolts and rods which are to be threaded and welded. This material, also, will be stiffer and stronger than either iron or weldable open-hearth steel. The combination of weldability and stiffness and superior machineability gives the soft grades of Bessemer steel a place of preference for the agricultural implement trade and similar uses.

With added sulphur, and sufficient manganese content to carry it, different gradations of a free-cutting material are produced: steel for cut thread bolts and nuts, steel for wood screws with more moderate manganese content, and the magnificent Bessemer screw steel, which cannot be duplicated for its purpose by any other steel mixture.

Interchanging in the Higher Carbons

In the higher carbon grades Bessemer steel is made for many special uses, and particularly for the agricultural implement trade, which in the main sticks to its old habits. These grades have the advantage of being a little stiffer in Bessemer. The mills have with permission substituted open-hearth of equivalent stiffness in higher carbons on many occasions, so that an interchangeability has been mostly established. In substituting basic open-hearth steel, in a general way the carbon content must be 0.15 per cent higher than that of Bessemer, but allowances are made for manganese and silicon, as the 15 points of carbon are allowed for the natural inherent difference from the Bessemer.

In structural shapes Bessemer steel is used successfully up to certain thicknesses and sizes. One will follow very closely these rules:

I-Beams—10 in. and smaller, but seldom above 6 in. Channels—10 in. and smaller, but seldom above 8 in. Angles—6 x 6 x 7/16 in. and lighter, but seldom put in 6 x 6-in. angles; the usual limit applied is 6 x 4 x 7/16 in. Tees—All sections 7/16 in. thick and less.

Trouble with Bessemer shapes is experienced at times in cold punching, shearing, curving to a radius, etc. They are especially susceptible to damage in straightening, and for this reason occasionally one fractures when suddenly overstrained, as by a fall or quick jerk in lifting. This is often a cause for undue alarm about their safety in use; with ordinary care in fabrication, however, they are safe for any standard specifications that allow them.

Bessemer steel which runs above the normal manganese content is apt to be brittle. This is somewhat more marked in the grades carrying sulphur, so that the regular Bessemer screw steel is a somewhat brittle mixture, and should not be used for any structural purpose. The bolt steel, however, carries a normal manganese and is not brittle. For the most part these grades are ruled out of structural use by sulphur specification limits.

Fills Out the Section More Closely

In the rolling mills Bessemer steel has a tendency to resist and fills the grooves, and so, on certain sections with deep flanges or sharp corners, it makes a superior dimension. In cold drawing it comes from the die larger and

*245 Melwood Avenue, Pittsburgh.

more uniform in size than open-hearth, and it tends to have a brighter surface. Sometimes these features favor the use of Bessemer.

Attempts have been made to simulate Bessemer qualities by making additions of phosphorus to open-hearth melts. The result is not the same. The phosphorus content is not different and some stiffness is added, with the bad fault of cold shortness to some degree. But it does not to any degree help machineability, and when so added phosphorus destroys welding quality. These experiments make the causes for the easy machining and the good welding qualities of Bessemer steel very obscure.

Knowledge of Facts Will Help Users

There are these special peculiarities which make it necessary to use precautions in applying and in working Bessemer steel. Were these facts well known to users of steel

a permanent confidence would be established behind its use. The main points in which the Bessemer grade is inferior depend upon a tendency toward brittleness under shock or under the effects of cold working, such as bending, punching and shearing. This is accentuated in the grades that carry manganese in amounts above normal—say, above 0.50 per cent roughly, or in segregated portions where the phosphorus tests high—say, much above 1 per cent. Besides this cold shortness, certain Bessemer grades show a more or less marked critical temperature in forging, especially when hot bending is involved—a sort of hot shortness without the expected sulphur as a cause.

If a few of these things are remembered, the use of Bessemer can be regulated properly and its application extended in the right channels, and proper care taken in its fabrication so that it is safe to perform the service for which it was specified.

British Flying Boats Made Entirely of Duralumin

Protection Given Against Corrosion by Anodic Oxidation Process—Light Alloy Found Superior to High-Strength Steel or Wood

ALL-METAL flying boats constructed by Short Brothers, Ltd., Rochester, England, are described in great detail in *Engineering* for Aug. 17. A 20,000-mile flight was taken a year ago in one of these boats by Sir Alan Cobham, powered by two Rolls-Royce "Condor" engines. The above

noted article describes a pair of machines constructed during the spring, which have three Bristol "Jupiter" geared engines, each developing 525 hp. at 2200 r.p.m. These are bi-planes of 93 ft. span, weighing 12,404 lb. empty. Each can carry 7596 lb. of load, which includes 15 passengers, pilot, navigator, steward, luggage, instruments, and gas and oil for a 500-mile flight.

Duralumin, protected against corrosion by the anodic oxidation process, is used for the bracing and the covering of hull, wing floats, and engine nacelles. (The latter are mounted midway between planes.) This light strong alloy forms the main spars, ribs and skeleton bracing of wings, rudder and ailerons. These parts are covered with doped fabric except for walkways of duralumin plate on the lower wing for platforms under the engines and walkways on the wing floats. The builders consider that duralumin is as light in weight as high-tensile steel for skeleton frames, is easier to work, and is also less liable to local injury on account of the greater thickness necessarily employed.

Details of the wing construction are shown in an accompanying illustration. The front spar shown dotted is uni-

form in shape from end to end, and consists of semicircular troughs top and bottom and corrugated sides. These are connected at the lapping flanges by 5/32-in. rivets. The plates are formed in a hand-operated screw press using metal-faced hardwood dies, and afterward finished by rolling. The number of plates used (all of No. 18 gage) depends upon the bending moment to be resisted. Joints between the duralumin tubing forming chords and diagonal bracing of the ribs are made by clips pressed from stainless steel sheet and 1/8-in. hollow rivets.

The hull and the engine nacelles are made of a number of cross frames to which is riveted the outer skin of duralumin sheet, varying from 14 gage to 22 gage. The interior of the hull and nacelles is entirely clear, except for

All Main Frames of Hull Are Made of Double Angles, to Which Outer Surface Is Riveted, and Flanged Plate to Give Lateral Rigidity

the depth of these frames. The latter are of varying construction, depending upon the load requirements; a sketch herewith may be taken as typical of the stronger ones in the hull. Between frames the outer skin is riveted to stiffeners of Vee cross section, the ends of the legs being flanged out for rivets on 2-in. centers. No water-tight packing material is used between the joints in the outer skin, water tightness being secured with a metal-to-metal joint by close riveting below the water line.

Duralumin has these advantages over wood for the construction of that portion of the flying boat which is submerged when in port: Its strength is known with much greater certainty. The weight is less for a structure of equal strength. Water soakage, which may add 500 lb. to the weight of wooden members after some service, is entirely eliminated. Metal hulls remain watertight and may readily be repaired by cover plates if punctured.

The Factory as an "Attractive Nuisance"

An Industrial Plant May Incur Serious Liability Through Injuries to Trespassing Children Attracted by Its Equipment

BY LESLIE CHILDS*

FAILURE to guard factory premises from access by children has frequently proved a costly mistake in management. Under the doctrine of "attractive nuisance" children, attracted by the nature of industrial equipment, may be held to have rightfully entered the premises, upon the implied invitation of the owner.

If such a child suffers injury, through contact with the plant machinery or equipment, the owner may be placed in a difficult position to defend an action for damages. The possible danger to industrial plants in situations of this kind is illustrated in a striking manner in the recent Texas case of *Duron vs. Beaumont Iron Works*, 7 S. W. (2d) 867, which arose under the following facts:

Machinery Attracts Children

In this case the defendant was engaged in the manufacture and sale of iron and machinery. It maintained an A-frame derrick, painted a salmon color, which stood in bold relief against materials and other equipment.

This derrick was upon the defendant's premises, located in a factory district, and access was easy by way of a spur track, which ran by the derrick and was frequently used as a footpath by people traveling in that vicinity. It does not appear that the premises of the defendant were guarded by a fence or otherwise, but there was evidence to the effect that defendant's employees ordered boys away from the derrick, because of the danger of their playing upon it.

On the day of the accident which resulted in this suit, the plaintiff, a boy between 13 and 14 years of age, accompanied by a younger brother, went upon the defendant's premises and began playing around the derrick. The boys in some manner started the boom of the derrick in operation, the plaintiff got his left hand in the cog wheels of the machinery, and all the fingers with the exception of the thumb were mashed off. Plaintiff thereafter brought action for damages against the defendant for the injury suffered.

This action was squarely based upon the doctrine of attractive nuisance—that the derrick was attractive to children of tender years and that, therefore, it became the duty of the defendant so to guard this machinery as to prevent injury to children who might come in contact with it. On the issue as raised, the trial of the cause resulted in a judgment against the defendant of \$5,000. The defendant appealed, and the higher court, in stating the case before it, said:

Attractive Nuisance Defined

"The theory of liability under the attractive nuisance doctrine is that, where the owner maintains a device or machinery on his premises of such an unusually attractive nature as to be especially alluring to children of tender years, he thereby impliedly invites such children to come upon his premises, and, by reason of such invitation, they are relieved from being classed as trespassers, but are in the attitude of being rightfully on the premises.

"Under such circumstances, the law places upon the owner of such machinery or device the duty of exercising ordinary care to keep such machinery in reasonably safe condition for their protection, if the facts are such as to raise the issue that the owner knew, or in the exercise of ordinary care ought to have known, that such children were likely or would probably be attracted by the machinery, and thus be drawn to the premises by such attraction. . . ."

Following the foregoing statement of the legal principle involved, the court turned to the record to ascertain whether or not the evidence was sufficient to hold the defendant liable thereunder. In reviewing the record, and in passing upon this question, the court used the following language:

What the Court Decided

"We think the evidence amply supports the findings of the jury. In the first place, the photograph of the hoisting derrick, . . . shows a device which a jury might conclude was well calculated to attract the eye of childhood. It was painted an attractive salmon color, and stood in bold relief, bright and attractive in the sunlight, while everything else about it was black, dirty and greasy.

"The giant boom . . . at the time of the accident was raised and extended some 40 or 50 ft. in the air. It and the derrick also were latticed with steel strips, which rendered it easy to climb, thus constituting a mute appeal to the climbing propensities of the average boy. Connected with the machine were pulleys, cylinder drum, cogwheels, ropes, and there was a platform leading up to it.

"The machine was not one in such general use as to be familiar to the average child. Each of the boys testified that he was attracted by the machine and went over to examine it and see how it worked. They also stated that they had passed by the machine many times, and had been theretofore attracted by it, but on these occasions had not had time to play with it; that they had made up their minds to go over and see how it worked as soon as they got a chance. . . .

"The device in this case was of such a nature as to be not only attractive for climbing purposes, but the machinery connected therewith which operated the giant boom was reasonably calculated to, and it seems did, arouse the curiosity of the injured boy and his brother. It also appears that the attractiveness of this device had theretofore allured other boys to inspect it. . . . We find no error presented that demands a reversal of the judgment of the trial court. . . . Judgment . . . affirmed."

In the light of this decision and other holdings it would be well for every owner or operator of an industrial plant to ask: "Is there upon my premises any machinery, equipment or condition that may fairly be termed an attractive nuisance?" And, if the answer is in the affirmative, a judicious expenditure, in erecting fences, walls or other barriers that will make the premises proof against access by children may prove a wise investment.

*332 East Vermont Street, Indianapolis.

Forging Machines of Heavier Design

Low-Weight Accurate Forgings Produced, with Pierced Holes That May Be Finished by Broaching

PROGRESS in the manufacture of machine forgings was reflected in the improved forging equipment and methods demonstrated recently by the National Machinery Co., at its Tiffin, Ohio, plant.

New models of high-duty forging machines, ranging in size from 2 to 7½ in., the latter weighing 365,000 lb. and said to be the largest ever built, were shown. These are of more rigid construction than those previously built by the company and are arranged so that the forging tools are maintained in the close alinement necessary for accurate work. To the development of machines of sturdier type is attributed the progress in the methods of manufacture and the improved quality of the machine forgings.

Low weight forgings of the internal displacement type are produced with pierced holes that are accurate within 0.015 to 0.020 in. of size, so that drilling is eliminated and the holes may be finished by broaching or reaming. The newer models also require less material to forge and a minimum of machining to finish. In accuracy of size and shape the forgings are said to approach die castings, and require the removal of only 1/32 to 1/16 in. of metal in finishing.

The majority of the machine-made forgings are produced without flash, and where there is a flash it is usually slight and is trimmed off in the dies. There is considerable saving in the cost of material by buying unannealed stock, it is pointed out, because the stock in being cut hot in the forging

machine does not require annealing. The scrap produced by the forging is limited usually to a short crop end and a very small slug from the hole.

The new machines have short compact bed frames, much of which are located below the floor line. In addition, massive tie bars are used to resist tension stresses. Compactness of the bed frame has been made possible, as in the company's previous line of machines, described in THE IRON AGE of Feb. 18, 1926, by the overarm heading slide which extends over and beyond the crankshaft. This added length of slide, together with the narrow width, is said to provide

an accuracy of movement to the heading slide that makes possible the internal displacement forging process. The same principle is applied to the grip slide, the long outboard support being a factor in securing close registration of die impressions. This construction, combined with powerful gripping action, is emphasized as keeping the dies closed against the hydraulic action of the heading tools on the hot stock and preventing swollen shanks and part line flash, the elimination of which materially increases the life of the dies.

Forgings Pierced Progressively

Progressive piercing of various types of forgings may be done on these machines. In deep piercing the stock is spread until it reaches the confines of the pierced die impression, there being no extrusion or lengthening of the upset portion. A recent

The Compact Bed Frame Is Made Possible by the Overarm Heading Slide. The new machines are equipped with large tie rods, as shown in the 7½-in. unit above

Heading and Gripping Slides Are Shown at the Upper Left. Dies for forging an oil well drilling tool joint are above, these dies and the slides shown at the upper left being used in the 7½-in. machine

Steps in Forging a Tractor Hub Are Shown at the Left. The hole is 1 9/16 x 5 5/8 in. The slug left at completion is indicated by the arrow

development is a die arranged so that the forging may be partly sheared from the bar, with the shear serving as a backing in the die against which the stock is forced by the piercing tool, thereby squaring the end. Being still attached to the bar, the forging can be transferred to another impression in the die in which the shearing operation is completed.

The making of forgings from the bar and piercing a hole completely through the blank is an important application of deep piercing on these machines. The blank is sheared from the bar, carried over into the die impression and on the same stroke a hole is punched through the blank. The thickness of wall of the pierced forging may range from that ap-

proaching seamless steel tubing up to several times the diameter of the pierced hole.

One application of the new 7½-in. machine, shown in the illustration, is in making a hollow tool joint used in oil well drilling. This forging is 15½ in. long and its outside and inside diameters at the large end are 8¼ in. and 6½ in. respectively. This forging is made in three steps, the first being two internal displacement operations and the third the punching of a small slug in the bottom. This machine weighs 365,000 lb. and requires four flat cars for shipment. The heading slide is 10½ ft. long and the driving motor is 150 hp. The machine is intended for continuous production of various types of large upset work.

Segment Wheel for Blanchard Grinder

SAVINGS in abrasive cost on medium and broad surface work is claimed for the segment wheel illustrated which has been made available by the Blanchard Machine Co., Cambridge, Mass., for use on its direct-motor-drive No. 16 surface grinder.

Less rapid wearing of the abrasive

of the segments, being round, have no corners to crack off. When the clamping screw is tightened the segments are forced outward against the surface of the chuck body and against the fixed abutments, a large area taking the clamping pressure.

More than 5 in. of the segments,

The Pocket That Holds the Segments and the Single Clamp for Positioning Are Shown in the Wheel With Two Segments Withdrawn

segments, as compared to a cylinder wheel, is said to be due to the spaces between the segments, which allow the particles ground from the work to escape easily from under the wheel. It is stated that on suitable work the life of the segments is about twice that of the cylinder wheel. Cutting is cooler and faster, less power is used and a wider variety of work can be ground without changing the grade of the segments.

Six abrasive segments held in position by three simple clamping devices are carried by a chuck, the body of which is machined from a solid piece of steel and is rust proofed. The three fixed abutments and three clamping units are of aluminum bronze, the screw in the clamping unit being of stainless steel. The ends

which when new are 6 in. deep, can be used and as they wear down they may be set out a distance of 2 in. from the chuck. This adjustment is made by running the magnetic chuck under the wheel, unclamping the segments, one pair at a time, dropping them down to the face of the magnetic chuck, using a sheet of cardboard or other material to protect its surface, and then reclamping in place. The clamping screws are located so that dirt cannot get into the threads to interfere with the removal of the wedge.

The segment wheel is not adapted for pieces that cannot be held securely, such as gear blanks which rest on a small hub, or work which is high and has little area in contact with the magnetic chuck.

Portable Machine for Squeezing Light Rivets

A NEW portable pneumatic riveter that squeezes instead of hammers light rivets into place is being manufactured by the Chicago Pneumatic Tool Co., 6 East Forty-fourth Street, New York, in two sizes. The smaller unit, weighing 8 lb., is designed for driving steel rivets up to ⅜ in. in diameter, duralumin rivets up to 5/32 in. and aluminum rivets up to

Squeeze Riveter for Light Sheet Metal Parts. Interchangeable yokes adapt the machine for pieces of various size

3/16 in. The larger machine weighs 16½ lb. and has capacity for driving 3/16 in. steel rivets, 5/16-in. duralumin rivets and ⅝-in. aluminum rivets.

The yoke is arranged so that it may be removed conveniently and replaced by another. Interchangeable yokes, which provide different sizes of gap and reach, permit use of the one machine for a variety of work.

Engineers Consider Fuel Problems at Cleveland

THE second National Fuels meeting conducted under the auspices of the Fuels Division of the American Society of Mechanical Engineers was held at Hotel Cleveland, Cleveland, Sept. 17 to 20, with a registered attendance of about 750. Victor J. Azbe, chairman of the Fuels Division, presided at the opening session. Thirty technical papers were presented during the four-day meeting. Separate sessions were held for various subjects and industries. These included industrial, powdered fuels, heat transfer, fuel characteristics, smoke abatement, refractories and stoker, central station and other sessions. The sessions were well attended and a great deal of interest was shown in the discussions.

Another fuels meeting is being planned for next year, to be held in the East, probably in New York.

Abstracts of several of the papers read last week will appear in later issues of THE IRON AGE.

The Aetna-Standard Engineering Co. is moving its quarters from the Realty Building in Youngstown to the Home Savings & Loan Building, where it has leased larger space. The company is also concentrating its engineering department in Youngstown, bringing engineers from Warren and Ellwood City, Pa.

Gleason Spiral Cutter Truing Fixture

CIRCULAR cutters used in connection with Gleason spiral bevel gear generators may be trued up accurately on the fixture illustrated,

accommodates the various sizes of spiral bevel gear cutters and has a large handwheel attached directly to it for turning the cutter to the point

The Fixture Facilitates Accurate Truing of Spiral Bevel Gear Generator Cutters

which has been placed on the market by the Gleason Works, Rochester, N. Y.

Heretofore these cutters have been checked, in most cases, on the generators. The truing fixture not only permits more accurate and more convenient checking of the cutters, but it releases the more expensive machines for production work. After truing, the cutters may be placed on the generator and used without further checking, provided the cutter spindle of the generator runs true.

The fixture is of simple design and is mounted on a rigid base, which is adjustable for height. The spindle

desired for checking. A lever at the front of the fixture serves to lock the spindle, this lock being used also when mounting or removing the cutter from the spindle. The spindle is mounted on carefully selected precision ball bearings and is ground in its own bearings. It is stated that the runout is thus reduced to within 0.00005 in.

Several different measuring instruments may be used in connection with the truing fixture, all of which read to 0.0001 in. By the use of a finger device operated through a system of levers, one indicator is used for checking both the inside and the outside of the cutting blades.

New Slip Roll Former

A SLIP roll former which is a departure from its split-bearing top roll lifting type machine has been brought out by the Niagara Machine & Tool Works, Buffalo. A special gear arrangement permits parting the front rolls sufficiently to allow

folded edges of sheets to pass through.

Arrangement of the machine may be seen in the illustration. A trigger release and knurled roll handle are located on the same end of the machine and upon completion of the forming operation the trigger

The Trigger Adjacent to the Roll Handle Permits Simultaneous Release and Pulling Forward of the Roll

release is pulled and the top roll swung forward in one movement. It is stated that this is accomplished in less time than is necessary in opening rolls of the split-bearing type.

The machine is provided with a heavy box section base to assure permanent alinement of rolls, bearings and housings, and tie rods are not employed. A full bearing sleeve is provided on the movable end of the front roll, which in the operating position is held in place by the trigger mechanism. When the upper roll is moved forward to permit removal of the work, the bearing sleeve remains in place on the roll, protecting the bearing from dirt and grit. Gears are of steel, machine cut, and are entirely inclosed.

Sheet metal up to No. 22 gage may be formed on the machine, three sizes of which, with rolls 2 in. in diameter and 30, 36 and 42 in. long, respectively, are available. The weight of the machine ranges from 195 to 265 lb.

Roller Bearing Speed-Box for Garvin Tappers

FOR use on Garvin No. 2-X and No. 2-BG automatic tapping machines, the Western Machine Tool Works

Four Selective Speeds Are Provided by the Speed Box, Which Is Taper Roller Bearing Equipped

Holland, Mich., has brought out a new tapered roller bearing speed-box which is intended to eliminate the single-speed speed-reducer. The speed-box may be furnished either for direct motor drive or single pulley drive machines, the latter being illustrated herewith. For direct motor drive, a base is furnished; for single pulley drive arrangement the unit is bolted directly to the base of the tapping machine. Four selective speeds are provided so that direct shifting

may be made from one speed to another.

The speed box is equipped throughout with Timken tapered roller bearings. Gears are of chrome-nickel steel, heat-treated and hardened. Long bearings are provided for the two sliding cone gears to prevent chattering and to facilitate shifting. The gears are of coarse pitch and the ends of the teeth are rounded for easy engagement. The gears, bearings, shafts, shifter forks and lever fulcrums are lubricated by the bath of oil in the

box. Shift levers are located within convenient reach of the operator.

All shafts are ground and are provided with fine threaded nuts for close adjustment of the roller bearings, the adjustment being made from the outside of the box. With a 1200-r.p.m. motor the spindle speeds of the No. 2-X automatic tapper are 223, 300, 432 and 582 r.p.m. and of the No. 2-BG tapper, 56, 76, 109 and 149 r.p.m. With an 1800-r.p.m. motor the spindle speeds of the No. 2-BG machine are 84, 114, 163 and 224 r.p.m.

The first station of the machine is without a tool head and is for unloading and loading the work. The other five stations have tool heads, which are arranged for rapid traverse downward and to the left to the point of cutting, where the feed motion is engaged. The tools feed through the cut and are then retired from the surface and returned to their initial high position.

Clearance is provided for turning work up to 4 in. in diameter for the maximum length of 12 in. and for 10 in. in diameter up to approximately 7¾ in. above the spindle. There is also clearance for facing flanged pieces. Setting of tools on the slides may be by individual or block-type combination tool-holders; they are firmly secured in place and are accessible for adjustment or change of tool bits. Individual speeds and feeds for each head are obtained by means of change gears on brackets in the upper compartment.

Multi-Au-Matic Center Lathe Announced by Bullard Company

A SIGNIFICANT development in manufacturing equipment for the automotive and other industries employing quantity-production metal cutting methods is a Multi-Au-Matic center lathe, announced recently by the Bullard Machine Tool Co., Bridgeport, Conn. The new machine is offered as providing for shaft turning the economies afforded by the chucking type of Multi-Au-Matic, one model of which was described in THE IRON AGE of Dec. 8, 1927.

The number of automotive and other parts for which the new machine is adapted is said to be as great as in the original chucking field, the savings in production time being also comparable. As an example of the latter the company cites a reduction from 3½ min. per piece in machining the spindle and brake drum flange of a steering knuckle forging on a single-spindle machine to 50 sec. on the Multi-Au-Matic center lathe. The time on a stem pinion requiring 4½ min. on a horizontal machine is reduced to 50 sec.

On the Multi-Au-Matic lathe six pieces are in process at one time and the individual operations on each piece are in sequence. Spindle speeds and tool feeds at each station can be set to suit the exact requirements of the work at the respective stations, which is emphasized as not only assuring maximum efficiency in each work unit, but as offering a further economy in tools, tool grinding and down time for tool change. It also permits intensive tooling without crowding and inaccessibility and facilitates the balancing of all operations and work units to be completed in the same length of time. The independent speed and feed arrangement at each station is further said to be easier on the tools and the work.

Pieces to be machined are set vertically, on end, between centers. In addition to concentricity in running and wearing of the work spindle on its bearings, a number of advantages are claimed for the vertical mounting. A live center tail-stock is mounted above, between guides secured to the work-spindle carrier, and is held firmly in place by a steady-ring. These tail-stocks are adjustable to accommodate work up to 12 in. in length between centers. The tail-center is

operated by a lever, one movement of which drops the center in place and binds it. The work is held and driven at its lower end by a power-operated chuck or other device mounted on the work spindle, and the pressure of all

feeding cuts, except in underfacing, is carried against this lower bearing.

The registering position of the work spindle in operation is not directly below the tool head as in the Multi-Au-Matic for chucking work, but is between the tool faces of the column. The arrangement is such that the tool slides and heads on the faces of the column are vertically and horizontally traversed to the point of cutting and retired to permit clearance in indexing the work.

Thorough attention has been given to the lubrication of bearings and other wearing parts, and a complete coolant system has been provided. The drive is by a 10-hp. constant speed motor through flexible coupling. The height of the machine to the top of the drive bracket is 128 in. and floor space requirements are a circle approximately 77 in. in diameter. In addition space of 25 x 29 in. is required for the coolant tank.

Heavy Increase in Orders for Steel Castings

WASHINGTON, Sept. 24.—Orders for steel castings in August totaled 80,932 tons, or 56 per cent of the capacity of 144,200 tons of the 129 reporting producers, according to the Department of Commerce. This represented a sharp increase over July orders, which amounted to 66,667 tons, or 46 per cent of capacity. Production also rose in August, aggregating 86,809 tons, or 60 per cent of capacity, against 78,324 tons, or 54 per cent of capacity, in July.

For the eight months ended with August orders were 654,529 tons, or 57 per cent of capacity, compared with 674,963 tons, or 59 per cent of capacity, for the corresponding period of last year. Production for the first eight months of 1928 totaled 690,063 tons, or 60 per cent of capacity, while for the eight-month period of 1927 production was 714,953 tons, or 62 per cent of capacity.

Of the August orders, 25,171 tons was for railroad specialties, being 37 per cent of this class of capacity, against 20,483 tons, or 30 per cent of such capacity, in July. Bookings of miscellaneous castings in August totaled 55,761 tons, or 73 per cent of this kind of capacity, against 46,184 tons, or 60 per cent of such capacity, in July.

Production of railroad castings in August was 27,157 tons, or 40 per cent of this class of capacity, compared with 27,501 tons, or 41 per cent of such capacity, in July. The output of miscellaneous castings in August was 59,652 tons, or 78 per cent of such capacity, against 50,823 tons, or 66 per cent of such capacity, in July.

Automobile Production Breaks Monthly Record

WASHINGTON, Sept. 21.—Totalling 458,513, production of passenger cars and trucks in the United States broke all records in August. The passenger car output was 398,689 units and 59,824 trucks were produced. The previous record of passenger car production, 397,332, made in October, 1925, was exceeded by 1357 last month, while the previous truck production record of 58,651, in September, 1925, was exceeded by 1173. The previous record of combined passenger car and truck production was 442,114 units, in October, 1925, now exceeded by 16,399. Passenger car and truck production in July, 1928, totaled 391,180.

Production of both passenger cars and trucks during the first eight months of 1928 totaled 3,051,304, of which 2,702,514 were passenger cars and 348,790 were trucks. Output during the corresponding period of last year was 2,646,285 units, of which 2,313,869 were passenger cars and 332,416 were trucks. Only in 1926 was the 1928 record surpassed, with 3,144,466 units in eight months, of which 2,801,720 were passenger cars and 342,746 trucks. Truck production this year

has made the highest total ever reached in the first eight months. Not only has it exceeded that of the first eight months of 1926, but also that of 1925, which showed in 12 months the greatest total of trucks (505,245) ever yet made in this country.

August production of automobiles in Canada, as reported to the Department of Commerce by the Dominion Bureau of Statistics, was as follows: Passenger cars, 24,274; trucks, 6971. This compares with 20,122 and 5104 respectively in July, and with 10,139 and 2387 in August of last year.

Foundry Equipment Orders Rise

Bookings of members of the Foundry Equipment Manufacturers Association in August were larger than for any month except May, this year, since 1924. The index of both gross orders and net orders for 19 companies was 278, using average monthly shipments for the years 1922, 1923 and 1924 as a base of 100. The index of gross orders in May, 1928, was 335.6. The index of shipments in August was 154.1, while unfilled orders at the end of the month stood at 467.2, or about the equivalent of three months' shipments at the current rate.

Employment Gains in Ohio Metal-Working Plants

Employment in Ohio iron and steel companies increased 3 per cent in August as compared with July, and 7 per cent as compared with August, 1927, according to the current bulletin of the bureau of business research of Ohio State University. The improvement was shared by 95 of the 160 reporting companies. In the first eight months of 1928 the average number of wage earners was 2 per cent less than during the same period last year. The index for the machinery group in August stood at 110, or 1 per cent greater than in July and 3 per cent greater than in August, 1927. The increase came from 57 of the 94 reporting concerns. Among automobile and automobile parts manufacturers the August employment index of 94 is four points higher than in July and 16 points higher than in August, 1927.

Increase in Coke Production

Production of by-product coke in August is reported by the United States Bureau of Mines at 3,994,924 net tons. This represents a gain of more than 2 per cent over the July figure of 3,911,082 tons. Correspondingly there was a gain in output of beehive coke, from 271,000 tons to 288,000 tons, making the total coke produced in August 4,282,924 tons. The gain over July was almost precisely 100,000 tons. Compared with August, 1927, the gain was 116,500 tons, or nearly 3 per cent.

Steel Furniture Orders Are Far Above Last Year

WASHINGTON, Sept. 22.—Orders for steel furniture in the "business group" in August were valued at \$2,619,230, against \$2,594,216 in July, according to reports received by the Department of Commerce from 34 producers. Shipments were valued at \$2,564,633 and \$2,515,482 respectively, and unfilled orders at \$2,118,633 and \$2,071,553 respectively. Orders for the eight months ended August, 1928, were valued at \$23,805,868, against \$20,655,390 for the corresponding period of last year.

Orders in the "shelving group" in August were \$863,420, compared with \$713,330 in July, according to reports received from 16 manufacturers. Shipments were valued at \$836,104 and \$722,516 respectively, and unfilled orders at \$734,365 and \$705,655. Orders for the eight months ended August, 1928, were valued at \$6,138,545, compared with \$4,997,919 for the corresponding period of last year.

Further Rise in Commodity Price Index

Commodity prices in August are reported by the United States Bureau of Labor Statistics at 98.9, on a base of 100 as the average of 1926. This is a fractional increase over the July figure of 98.3, which itself recorded a gain from the 97.6 of June. The figure was 95.2 in August, 1927; hence the year has shown an increase of 3.7 points, or about 3.8 per cent.

Foods, fuels and metals recorded the principal gains during the month. The latter advanced from 98.6 in July to 100.4 in August. This was brought about by fractional advances in iron and steel and non-ferrous metals and a substantial advance in the automobile index. A year ago the metal index stood at 98.

Immigration 20,682 in July

WASHINGTON, Sept. 22.—Immigrants entering the United States in July totaled only 20,682, while the number of emigrants was 7804, according to the Bureau of Immigration. The bulk of the immigrant aliens came from countries in the Western Hemisphere, with Canada and Mexico leading the list. These two countries, with 5234 and 4927 respectively, contributed almost one-half of the total, while Central and South America and the West Indies sent 895.

Germany led the list of European countries, contributing 2205, followed by Italy, 1885, while the Irish Free State sent 1024, Great Britain, 1020, the Scandinavian countries, 778, and Poland, 367. Of the emigrants, nearly 80 per cent, or 6205, went to Europe. Italy, with 1624, received the largest number, while 1060 went to Germany, 599 to Great Britain, 406 to Greece and 416 to Poland.

Offers Tools of Widia Alloy

Higher Efficiency Claimed, Based on Increased Cutting Speeds, and Ability to Hold Cutting Edge

TOOLS and tool bits of Widia alloy, manufactured by Fried. Krupp Steel Works, Essen, Germany, as noted in *THE IRON AGE* of March 17, 1927, are being placed on the American market by Thomas Prosser & Son, 15 Gold Street, New York. This alloy, which in hardness is said to be only slightly inferior to a diamond, is available in a wide variety of shapes and in sizes up to 1 x 1 x 4 1/4 in.; also as points for drills ranging in diameter from 1/8 to 2 1/4 in. The material does not require heat treatment and except for brazing to the shanks and grinding by a special wheel developed for the purpose, the tool bits are ready for use as manufactured.

Claims for the higher efficiency of the Widia tools are based entirely on the greatly increased cutting speeds made possible while retaining the feeds and cuts usually employed with high-speed steel. It is claimed that the metal operates efficiently even with its cutting edge at a bright red heat, as it has no temper to be drawn, and the ability of the alloy to hold a cutting edge is said to be several times greater than that of high-speed steel. Tools of the Widia metal are used successfully for intermittent cuts, and to illustrate the effectiveness of the tool under these conditions the makers cite a recent test of one of the cutters in machining an 1 1/4-in. cast iron workpiece of 200 Brinell hardness, having two slots 1 3/8-in. wide extending the full length. The feed was 0.036 in., the depth of cut 0.59 in. and the cutting speed 655 ft. per min. The intermittent cutting caused by the two slots is said to correspond to 400 blows per min. at the edge of the tool, which at the completion of the test is said to have suffered no injury.

Cutting Qualities Unaffected by Sand or Slag

The cutting qualities of the alloy are also unaffected by sand or slag and in the machining of bakelite, light alloys used for automobile pistons and other material having abrasive characteristics, the tool bits are said to give unusual service. The increased efficiency of the Widia tools as compared to high-speed steel, using the chip cross-section multiplied by the cutting speeds as the basis, expressed in percentage, is given by the company in part as follows: Cast iron, 400 Brinell, 200 per cent; cast iron, 160 Brinell, 600; brass, 800; hard rubber and similar materials, 500; cast iron with silicon up to 16 per cent, 200; manganese steel, 12 per cent mn., 150; rustless steels, 300; and chilled iron, 65 to 90 scleroscope, 400 per cent. Steels of different tensile strengths are said to be machined at 75 to 200 per cent increase in efficiency as compared with high-speed steel.

Widia metal can be brazed to carbon tool steel, but not to high-speed steel,

the brazing being done with brass or copper, preferably the latter, at 1150 deg. C. The flame should be reducing, so that when using gas, there should be an excess of gas. The quality of the material is affected by a direct flame and therefore it is desirable to do the brazing in a muffle furnace or to protect it by a wall of fireproof material. After preparing the surfaces of the tip and shank so that they make close contact throughout, the tip is put in place, and the shank and tip heated. The brazing material is then put between the tip and shank and heated until the brazing material runs off on all sides. The tip is then pressed on the shank by means of a light pressure, and the tool then placed in pulverized electrode carbon in order to cool slowly and to protect the edge from the influence of the oxygen in the air.

Sharp Edge Essential

A prerequisite to the successful working of the Widia tools is a sharp edge, which is obtained by means of special grinding wheels. These can be furnished in grades for rough and finish grinding. Wet grinding is preferred and grinding speeds of 3936-4920 ft. per min. are recommended. Overheating by dry grind-

ing must be avoided, as well as too sudden cooling by water, because overheating or sudden cooling tends to crack the material. The grinding machine should be of such design and in such condition that vibration is eliminated. The grinding is said to be accomplished in the same time and at the same cost as the grinding tools of high-speed steel.

When used for intermittent cuts the tool is held very close to the cutting tip and is fixed very firmly to eliminate vibration and chatter, which must also be absent in the case of revolving tools of Widia metal. To avoid damage to these tools, they must be removed from the cutting position when the machine is stopped for gaging of the work or for other reasons. For heavy cuts a side slope of 3 to 5 deg. is recommended so that the chip may be guided to one side of the tool.

Tool angles recommended for turning, boring and milling with the Widia alloy range from a clearance of 4 deg. and a lip angle of 82 to 86 deg., for chilled iron to 6 to 8 deg. clearance and 60 to 75 deg. lip angle for cast steel. For planing tools the clearance is 4 deg. and the lip angle is approximately 5 to 10 deg. greater than that of the turning tools. In planing and shaping operations it is necessary that the tool be lifted from the work on the return stroke of the tool. In turning, the tool must be located at or slightly above the center line of the work and, in boring, the tool should be at the center line.

Electrochemists Honor Edison

The American Electrochemical Society, in session at Charleston, W. Va., Sept. 20 to 22, bestowed upon Thomas A. Edison, a member of the society since the year of its inception, the distinction of honorary membership. Edison's achievements in the electrochemical field are well known. His alkaline storage battery set a new standard for high capacity at minimum weight. He has also contributed many valuable processes and products in the electrochemical plating art. The phonograph record owes its very existence to high perfection in electroplating.

Cartel Output to Be Unchanged in Last Quarter

WASHINGTON, Sept. 25.—The International Steel Cartel at a meeting in Luxemburg, Sept. 14, voted to continue production during the closing quarter of 1928 at 7,321,750 metric tons, the level maintained in the earlier quarters of the year, says a cablegram received by the Department of Commerce from the commercial attaché in Brussels.

Following the action of the conference at Düsseldorf, July 13, when the Central European Steel Cartel was

abolished, Czechoslovakia, Austria and Hungary were allotted separate ton-nages instead of the group allotment that had been in effect. The combined allotment, however, continues the same as when they were in the Central European Steel Cartel.

At a meeting, Sept. 10, the machine-wire cartel voted to increase the export price of its product 2s. 6d. (61c.) per ton.

Pittsburgh Steel Co. Profits Decline

The Pittsburgh Steel Co., Pittsburgh, had net income after all charges in the year ended June 30, 1928, of \$1,342,141. This compares with \$1,951,958 in the previous fiscal period and with \$2,533,577 in the year ended June 30, 1926. Other comparisons with the 1926-27 period are not available. Total inventories as of June 30, 1928, amounted to \$11,086,199 as against \$9,105,955 on June 30, 1926. The largest gain was shown in finished steel products, the stock at the end of the 1928 fiscal year having stood at \$3,617,727, as compared with \$2,319,124 in 1926. Average number of employees at the company's steel works in the 1927-28 period was 4520 as against 4834 in the 1925-26 fiscal year. Shipments of finished steel products during the most recent period amounted to 384,083 net tons.

Discuss Aircraft Manufacture

Mechanical Engineers on Ohio River Trip Deplore Relative Ease of Establishing Plants

ASHLAND, KY., Sept. 25.—With approximately 225 members and guests on board the steamboat Cincinnati, en route to Ashland, Ky., to inspect the continuous sheet mills of the American Rolling Mill Co., the first technical session last night of the national machine shop practice meeting of the American Society of Mechanical Engineers created more than normal interest. A paper by Hugh W. Roughley, quality manager Wright Aeronautical Corporation, Paterson, N. J., read in the author's absence by L. C. Morrow, described in detail the inspection methods and quality control in the manufacture of aircraft engine parts and was the feature of the session. That the airplane industry is getting out of the purely experimental stage to a stabilized basis, comparable with that of the automobile industry fifteen to twenty years ago, was the report made by Eric Oberg on the consensus of opinion of men attending an aircraft meeting held at Wichita, Kan., last week. The greatest need of the industry today

is a small reliable reasonably priced motor for small planes. Unfortunately the airplane industry is one of the cheapest lines in comparison with the price of the product into which a manufacturer can put his resources. Little equipment is needed and the time necessary for getting into production is remarkably short, so that many builders who know nothing about the business are attracted to that field. The result is likely to be that the industry will acquire a bad reputation from which it will require much time to recover.

Bennett Chapple, vice-president American Rolling Mill Co., made a short talk in regard to the continuous rolling of sheets at Ashland. R. E. Flanders, manager Jones & Lamson Machine Co., Springfield, Vt., presided in the absence of Capt. E. E. Aldrin, Wright Field, Dayton, Ohio. After the trip through the Armco plant today, the technical sessions will be continued tonight aboard the Cincinnati and Wednesday morning at the Hotel Sinton, Cincinnati.

bring the building code of New York into conformity with the codes adopted by practically all cities of the United States as a result of our recommendations. We hope that steel construction, rendering buildings fireproof, will ultimately supplant all of the present non-fireproof structures."

New Sales Agency for Copper Formed

The Phelps Dodge group of copper producers has formed a new selling agency through which to market its copper, to be known as the Phelps Dodge Sales Co., Inc. Beginning Oct. 1, the new company will market all copper heretofore sold by the Phelps Dodge Corporation and the Nichols Copper Co., control of which is owned by the Phelps Dodge Corporation. That will include the product of the Phelps Dodge Corporation, the Calumet & Arizona Mining Co., the C'd Dominion Co., also of the Nichols Copper Co., and its clients, including the United Verde Extension Mining Co. and the Granby Consolidated Mining, Smelting & Power Co., Ltd.

The officers of the Phelps Dodge Sales Co., Inc., will be Walter Douglas, chairman of the board; C. Walter Nichols, president; Gordon R. Campbell, vice-president; A. T. Thomson, secretary and treasurer; Walter C. Bennett, chairman of the advisory committee; Charles A. Austin, manager of sales, and Martin H. Crego, assistant manager of sales.

The directors will be Walter Douglas, C. Walter Nichols, Gordon R. Campbell, Cleveland E. Dodge and Walter C. Bennett. Mr. Douglas, the chairman of the new company, is the president of the Phelps Dodge Corporation, while Mr. Nichols is president of the Nichols Copper Co.

The offices of the Phelps Dodge Sales Co. will be at 99 John Street, New York.

Scrap Freight Rates Asked on Defective Material

WASHINGTON, Sept. 25.—Briefs have been filed with the Interstate Commerce Commission by steel makers, jobbers and others interested, asking that rates no higher than the billet or scrap rate be established from Pennsylvania, Ohio, West Virginia and Kentucky points to Youngstown, Cleveland and Detroit on wasters and other defective materials. Tariffs proposed by the carriers, now under suspension, call for the same rates on wasters as those applying on prime finished material. The proposed billet or scrap rate, the briefs contend, would be in conformity with the commission's decision in the Wrought Washer Mfg. Co. case.

from the Harvard Graduate School of Business, Soldiers' Field Station, Boston, or from A. H. Oberndorfer, Siver Steel Casting Co., Milwaukee, chairman awards committee, National Industrial Advertisers' Association.

New York Favors Structural Steel Standard

An amendment increasing the working stress in structural steel has been adopted by the New York Board of Aldermen, which is expected to save builders in that city approximately \$6,000,000 on current contracts for new structures. The amendment is based upon a standard specification of steel construction recommended by the American Institute of Steel Construction and was introduced by a committee representing the New York and Brooklyn chapters of the American Institute of Architects, the American Institute of Consulting Engineers, the Building Trade Employers Association, the Iron League of New York and the New York and National Boards of Fire Underwriters.

The old building code permitted a basic working stress of 16,000 lb. per sq. in., but under the amendment the basic working stress may be increased to 18,000 lb. per sq. in. This reduces the amount of steel going into a building roughly by 10 per cent. By reason of this change, estimated on current contracts, the city itself will save about \$500,000 a year on school buildings alone.

Commenting upon the amendment, Charles F. Abbott, executive director American Institute of Steel Construction, said: "The amendment will

\$2,000 Award for Best Industrial Advertising

Again the Harvard advertising awards committee of the National Industrial Advertisers Association has announced the annual Bok award of \$2,000 for the best industrial advertising campaign for 1928 appearing in newspapers and periodicals. Closing date of this competition is Dec. 31.

To enter competition for this award, the industrial advertisers must submit a manuscript describing the campaign, its functions and its application, together with reproductions of the "ads" as they appeared and a statement of the analysis of the market on which the campaign was founded. The manuscript and the ads must be submitted in prescribed form, the details of which may be secured

Exhibit of Highway Equipment at Mexico City

A special train carrying 450 American delegates to the second Mexican Highway Congress will leave San Antonio, Tex., Sept. 28, en route to Mexico City. A feature of the congress will be an exhibition of highway building equipment, covering 125,000 sq. ft. of floor space. Exhibits will be shown by 100 manufacturers of the Western Hemisphere, of which 85 will be from the United States.

Steel Barrel Shipments

Shipments of steel barrels by members of the Steel Barrel Manufacturers' Association in August totaled 380,343 units. The volume of business for the month was \$1,093,889. Unfilled orders at the end of August were for 358,581 units. Productive capacity was engaged during the month at an average of 56 per cent, light barrel capacity being employed at 63 per cent, against 27 per cent for I.C.C. barrels.

Acheson Establishes Prize Fund

Inventor of Graphite and Carborundum Donates \$25,000 for Benefit of American Electrochemical Society

AT the fifty-fourth convention of the American Electrochemical Society at Charleston, W. Va., Sept. 20 to 22, Dr. Edward Goodrich Acheson, known the world over for his electric furnace products, presented to the society \$25,000 as a trust fund. This is to form the basis of an award every second year of a gold medal and a prize of \$1,000 to any man who has made a distinguished contribution to any of the branches fostered by the American Electrochemical Society.

Dr. Edward Goodrich Acheson was born on March 9, 1856, at Washing-

EDWARD G. ACHESON

ton, Pa., where his grandfather, coming from Ireland, settled in 1788. In 1880 Doctor Acheson entered the employ of Thomas A. Edison at Menlo Park, N. J., then a "fountain head of chemical knowledge and experiment." His first position was that of assistant draftsman under John Kruesi, father of the present president of the American Electrochemical Society. In July, 1881, Doctor Acheson was sent as first assistant engineer of the Edison interests to the electrical exposition in Paris. He returned to the United States in 1884 and for a time was connected with the Consolidated Lamp Co. of Brooklyn and the Standard Underground Cable Co. of Pittsburgh. The spirit of experiment was strong with him, and electrical and chemical problems engaged his spare hours.

Early in 1891, Doctor Acheson produced in the electric furnace the first sample of carborundum, the well-known abrasive and refractory. Not long after the invention of carborundum, Doctor Acheson produced the first large sample of artificial graphite. He took ordinary coke and heated it to extremely high temperatures in his electric furnace, the hard brittle coke being transformed into a soft,

unctuous product, graphite. And this graphite, which he thus produced artificially, was better and purer than the natural mineral "plumbago" or "black lead" as natural graphite is commonly called. Today about 20,000,000 lb. of Acheson graphite is produced annually. The applications number a thousand and one: Lubricants, electrodes, crucibles, etc. The tungsten wire of the incandescent lamp owes its existence to "aquadag," an aqueous lubricant of "defloculated Acheson graphite." The range of American guns was increased 20 per cent by surfacing the inner walls with graphite. The product is so fine that it will pass through a chemist's filter paper, which ordinarily retains the finest precipitate.

Doctor Acheson's name is widely known. His career has been a fascinating and fertile one. Untiring in his zeal and highly skilled in the experimental art, he has transformed into realities the visions of his active and imaginative mind.

Wages and Hours in Radio Manufacturing

Analysis of labor conditions in the radio manufacturing industry has been made, by the United States Bureau of Labor Statistics, in such form that the manufacture of radio receiving sets, of loud speakers and of tubes are handled separately. The number of establishments covered was 23, 19 and 18 respectively, with total employees of 10,070, 2428 and 2213 in the three branches of the industry.

Average hours in making receiving sets were 48.4 for a full-time week and 45.8 for the typical week actually worked. These figures are for the latter half of 1927, radio manufacturing being a seasonal occupation, with greatest activity in the second half year. Average earnings were 59c. an hour for male employees and 38.4c. for female, giving an aggregate of 50.8c. for all workers. In this branch of the industry, 58 per cent of the employees were male. Earnings in a full-time week averaged \$28.62 for male employees, \$18.55 for female and \$24.59 for all employees.

In the manufacture of radio speakers the male employees outnumbered the female almost two to one. Average hours were 47.8 in a week. Hourly earnings averaged 55.5c. for male employees and 39.9c. for female, being 50.2c. for all employees. Full-time earnings weekly were given as \$26.86 for male employees, \$18.67 for female and \$24 average.

Making of radio tubes showed a large preponderance of female employees, who aggregated five-sixths of the total. Average hours in a full-time week were 48.6. Earnings of male employees averaged 60.2c. an

hour against 40.7c. for females and 44.4c. for all employees. Earnings in a full-time week showed an average of \$29.44 for males, \$19.74 for females and \$21.58 for all employees.

Leading Malayan Tin Companies Merged

Consolidation of important Malayan tin producing companies has just been concluded under the aegis of the Anglo-Oriental Mining Corporation with a view to arranging for single technical direction and a coordinated policy in marketing. Although the names of the companies concerned have not yet been disclosed, it is understood that they control, or will control between them, approximately 12 per cent of the world output of tin.

This is the most recent of several significant mergers in the tin producing industry reported this year. Earlier in the year a large number of Nigerian companies, controlling 65 per cent of the Nigerian output, were absorbed into a single group called the Associated Tin Mines of Nigeria, with a single sales and technical organization. Since then the Anglo-Oriental group, which controls this merged group, has been drawing together a large number of concerns in Burma, Siam and Malaya into a single cooperating organization called the Anglo-Oriental (Malaya), Ltd.

The significance of the latest consolidation is that all these groups will now be associated under single control and the marketing of the greater proportion of the world's tin will in effect be in the hands of three great combines the Dutch, the Patino interests and the Anglo-Oriental group.

German Works to Increase Electric Steel Output

HAMBURG, GERMANY, Sept. 11.—Completion of the new Ruhrtalkraftwerke (Ruhr Hydroelectric Power Plant) some time this winter is expected to greatly increase German production of electric steel, which for the past two years has been from 14,000 to 16,000 tons a month. The power station is being constructed with the financial aid of the steel works in the Ruhr and will supply a part of its current to these plants, which plan to use it to increase their production of electric steel. In some quarters it is estimated that output will be about doubled, while crucible steel production will be further curtailed. As German consumption of electric and crucible steel is only about 20,000 tons a month, it is expected that a large portion of the increased output of electric steel will be exported.

The seventh national exposition of power and mechanical engineering at the Grand Central Palace, New York, Dec. 3 to 8, will include the marine field.

Seek Equalized Freight Rates for Coke

Producers and Consumers of By-Product Coke to Meet Oct.

1 in Attempt to Formulate Satisfactory Schedule

WITH an increased output of by-product coke for domestic use in the Central Western States and with keener competition for a market for this fuel, which in the case of steel plant coke ovens means the disposal of surplus coke, by-product coke producers have renewed their efforts to have new rail rates established on their domestic coke output. They will attempt to agree among themselves upon certain fixed rates between producing and consuming points in the Central Freight Association territory and secure the adoption of these rates in place of the mileage rates that have been proposed by the railroads. Formerly all by-product coke rates were on a mileage basis in this territory. As additional steel plant coke ovens were built and as the output was also increased by new ovens built by commercial and gas plants there was considerable departure from these mileage rates, resulting in a chaotic rate situation. This unsatisfactory situation still exists. In some cases there were different rates covering movements in opposite directions between the same two points. This condition exists today between Valley points and Erie, Pa., the Valley rate to Erie being \$1.51 per ton and the rate from Erie to the Valley \$1.76 per ton.

Coke producers have held meetings at various times during the past three years to attempt to work out rate schedules between producing and consuming points that would replace the present rates, but they have been unable to reach an agreement. Because

of the failure of these efforts a new committee was organized last year known as the Producers and Consumers Coke Committee, which is continuing the work.

While the by-product coke producers were trying to iron out their differences of opinion over rail rates, the railroads of the Central Freight Association in June, 1927, prepared a new mileage rate scale for by-product coke, which is still pending. Some of the rates per ton proposed in this scale are as follows:

20 miles and under, \$1.01; 50 to 60 miles, \$1.51; 80 to 90 miles, \$1.89; 100 to 120 miles, \$2.14; 120 to 140 miles, \$2.27; 200 to 225 miles, \$2.77; 300 to 325 miles, \$3.28; 500 to 525 miles, \$4.16; 725 to 750 miles, \$4.67.

Committee to Meet Oct. 1

The Producers and Consumers Committee has held various meetings, at which conflicting views were presented. Another meeting will be held about Oct. 1, and the committee plans to stay in session until it reaches an agreement, even if it takes a week. This committee is under the chairmanship of Murray N. Billings, traffic manager Illinois Steel Co., Chicago. If the committee succeeds in agreeing, its proposed rates will be submitted to the carriers for their approval as a substitute for the mileage rates suggested by the railroads.

With by-product coke producers seeking new markets for their output, Michigan seems to have become the important battleground for ovens in

adjoining districts. Some producers, perhaps looking out for their own interests, want low rates for long hauls and high rates for short hauls. Others want high rates for long hauls and low rates for short hauls. Another proposal that will be considered is for the establishment of a separate and lower rate scale for blast furnace coke, which in some cases is shipped a considerable distance to furnaces that are under the same ownership as the coke ovens. While domestic coke is usually shipped in single car lots, furnace coke is moved in large volume, sometimes in full trainloads. For this reason it is maintained the railroads can carry this coke cheaper than domestic coke.

Booklet on Spiegeleisen

Feeling that the value of spiegeleisen has never been adequately stressed, the New Jersey Zinc Co., New York, has issued a booklet of 12 pages, which discusses the history, grades and uses of this alloy, as well as methods for sampling and analyzing. An interesting feature is a table giving the equivalent value of spiegeleisen and 80 per cent ferromanganese.

Details of mass manufacturing of vehicles and parts will be discussed in addresses to be given at the convention of the Production Division of the Society of Automotive Engineers to be held in Detroit Nov. 22 and 23. The annual four-day meeting of the society will take place in Detroit, Jan. 15 to 18, following the annual dinner in New York, which will be part of the society's participation in the National Automobile Show in that city.

New Testing Laboratory of American Gas Association At Cleveland

THE building, here shown, which has just been completed for the American Gas Association and which will be given over largely to the testing of gas appliances, is "dedicated to promote and develop the gas industry to the end that it may serve the best interests of the public to

the fullest possible extent." The structure provides 3200 sq. ft. of office space, 8700 sq. ft. for storage and 14,700 sq. ft. for appliance testing and research. Three rooms are given over to the uses of the 200 manufacturers who make up the membership of the association.

This Issue in Brief

Demand for special steels is widespread. While much of the expanding tonnage of high-grade steels is absorbed by the automotive and railroad industries, makers of all sorts of equipment are participating in the demand.—Page 741.

* * *

Hardens transmission gears by duplex method. A combination of electric furnace and cyanide treatment is used in Dodge plant. Furnace temperature is 1485 deg. Fahr. and cyanide pot 1490 deg.—Page 762.

* * *

Finds duralumin superior to high-strength steel or wood for flying boat construction. The aluminum alloy, protected against corrosion by the anodic oxidation process, is used for bracing and for covering hull, wing floats, and engine nacelles. It is considered less liable to local injury than steel, on account of the greater thickness employed.—Page 766.

* * *

Commodity price average continues to rise. August index of Bureau of Labor Statistics was 98.9, against 98.3 in July and 95.2 in August, 1927, an advance of 3.8 per cent in one year. The average of 1926 was 100.—Page 772.

* * *

New cutting tools are said to be almost diamond-hard. Greatly increased cutting speeds claimed for new Krupp alloy. Ability to hold a cutting edge is several times greater than that of high-speed steel, maker declares.—Page 773.

Uniform machinability, toughness and soundness are gained by use of new deoxidizer in making steel, producer declares. Harmful aluminum oxide or aluminum carbide inclusions are said to be eliminated in the ladle by adding a carbon-free alloy of aluminum, silicon and iron.—Page 742.

* * *

New testing machine could pull apart a 26-in. billet of structural steel, says maker. Yet this universal testing machine, said to be the largest in existence, is so sensitive that it responds to a slight pressure of the hand.—Page 749.

* * *

Succeeds in making a twist drill which will cut high-manganese steel castings. New drill, running at 50 r.p.m., with 0.0075-in. feed, cuts nine holes through 1½-in. material with one grind.—Page 750.

* * *

For aircraft welded construction, chrome-molybdenum steel is said to be most suitable. The heated joint air-hardens on cooling and thus regains nearly all the original strength.—Page 742.

* * *

Where machinability, weldability and stiffness are needed in combination, Bessemer steel is superior to open-hearth, metallurgist declares. Possession of these three qualities gives Bessemer a preference for agricultural implement trade and similar uses.—Page 765.

* * *

Manufacturer held liable for injuries received by child trespassing on plant property. Manufacturer should have guarded premises, court rules.—Page 767.

Quenches ring gears in press. After carburizing and hardening, Dodge ring gears are quenched in oil in a press and drawn 40 min. at a temperature of 300 deg. Fahr.—Page 764.

* * *

Under effects of cold-working Bessemer steel has a tendency toward brittleness. This is accentuated when manganese content is above normal. Bessemer shapes are especially susceptible to damage in straightening.—Page 765.

* * *

Will growth of "industrial institutes" curtail straight competition? No, says editorial writer. But blind competition may be eliminated, for which both buyers and sellers should be thankful. Exchange of business statistics among competitors permits business to be done in the daylight.—Page 778.

* * *

Automobile production close to record. During first eight months of 1928 the total output of passenger cars and trucks was 3,051,304. Only in 1926 was this surpassed, with 3,144,466 units in eight months.—Page 772.

* * *

High machinability is produced by annealing transmission gears to obtain a microstructure of coarse lamellar pearlite, with some massive ferrite, without any sorbite or spheroidal cementite.—Page 762.

* * *

Smaller as well as larger companies are cooperating in simplification, Department of Commerce reports. Fourteen per cent of 212 producer-acceptors behind 10 simplified practice recommendations are capitalized under \$100,000.—Page 774.

ESTABLISHED 1855

Competition in Darkness or Daylight?

THE organization of industrial institutes and their effect upon competition are viewed with concern in some quarters. Thus, the *New York Journal of Commerce* writes: "This new kind of competition proves upon analysis to be the antithesis of the economist's definition, implying as it usually does some sort of agreement to combine or at least to cooperate to reduce the intensity of the competition already existing." Here the implication is that this will lead to some new kind of governmental regulation.

The "new competition" is indeed different from the old, as Arthur J. Eddy showed in his book under that title some years ago. In former times competition was haphazard and produced violent cycles, which were but imperfectly understood. In periods of strong demand producing capacity was extended, generally too much, the result being that industries became overbuilt and overmanned, with the ensuing evils of a cut-throat struggle for business, unemployment and general loss. The pendulum then would overswing the other way and upon revival of demand industries would be found to be underbilt and prices would tend to rise extravagantly.

It may be declared as a principle that an extravagant rise in prices is the premium offered for new capacity, while conversely an extravagant decline is nature's method of extinguishing an excess. During the World War this principle exhibited itself in acme. When the price for spelter rose to 25 cents per pound buyers were simply advancing the cost of building new plant, to be amortized perhaps in a year. In peace such orders are far less imperative than in war, but the theory is the same. In practice the great difficulty was that no one had any means of gaging what the market was saying. Its tenor was clear but its pitch certainly was not.

In our modern development this has been changed in that we are able to translate into numerical expressions what was formerly only vague sentiment. There is just the difference between doing business in the daylight and in the dark. There is no curtailment of straight competition. There may be an elimination of blind competition, and for that everyone should be thankful. If blind competition occasionally produces bargains for buyers and profitless activity for sellers, oppositely it leads to the strangulation of buyers and temporarily to plums for sellers. Contraction of fluctuations is so beneficial that it is welcomed by both buyers and sellers. If academic economists have any different definition of the meaning of competition or its working, they will do well to revise their dogmas.

Does the Public Know Us?

AT a recent meeting of the Lake Superior Mining Institute, held jointly with the iron and steel division of the American Institute of Mining and Metallurgical Engineers, Thomas T. Reed of the latter organization emphasized the undoubted fact that the public as a whole has no real appreciation of the importance of the iron and steel industry to our modern machine-made civilization. Engineers, constructors and manufacturers readily recognize that iron and steel are fundamental. Even though they work in wood, or silk, or sugar beets, the machinery which brings in the raw materials, which actually does the work, which finally delivers the goods at home or abroad is impossible except for ample and ready supplies of iron.

But the public generally does not stop to think that things made of iron and steel cultivate the farms, pack the foodstuffs, weave the textiles, transport all commerce, and carry all passengers. Ask a man at random, and he would probably say (thanks to publicity) that electricity is the most potent mechanical influence in his life; but he would fail to visualize the large quantities of iron, steel and copper without which electricity could not be generated or transported to his many utilities.

The same is true of steam, of coal, of transportation. Whatever aspect of everyday life one views it is machine made; in its present form it needs steel and iron in increasing amounts—but sad to say, the average man does not comprehend it.

It is important that this mutual relationship between the ordinary citizen and the iron and steel industry be brought home to him. To achieve this object would be the justification of a most determined publicity effort. The whole industry could not do better than to foster jointly such an attempt. Just now we hear much from contending politicians, vying for the farmer's vote, as to the essential nature of agriculture; how it must be fostered, how all artificial handicaps must be removed, how it may even be subsidized. While the iron and steel industry does not expect any coddling, nor does it need it, a proper appreciation of its importance would avoid some well-meaning but misdirected actions against trusts and "malefactors of great wealth." An intelligent golden-rule policy of live-and-let-live would naturally be set in operation. That such a consummation is possible is proved by the public attitude toward the telephone system, as rich and complete a monopoly as could be wished, yet well managed enough to acquire the confidence and good-will of the vast majority of the people.

Prosperity is a mutual thing. If one section of our

country suffers, or one nation in the world family, its condition affects economic life in a wide area. Contrariwise expanding wealth creates more wealth. Such facts are now becoming generally appreciated. It remains to associate with them in the popular mind a vivid realization of the necessity for a sound condition in the fundamental industries, those that underly modern civilization. Of such industries iron and steel is chief.

Why This Stock Market?

FEDERAL RESERVE banks appear to have suspended their efforts to control the stock market. At the same time, commercial banks have essayed to discourage the private lending of money on call. The rate for call money continues high. Nevertheless, the stock market pays but scant attention to any of these conditions. Indeed, there has been a renewed bull movement, with a broader participation in the stock market than ever before. The business of New York brokerage houses that emanates from their branches as far west as San Francisco and as far south as New Orleans is immense. Hence, four-million-share days.

The public has gone into the market with its own money to a greater extent than ever, buying outright or preserving large equities. Thus, it is not shaken out by breaks. The public also is showing unusual discrimination, selecting those securities that give good promise, for economic reasons, of increase in value. Hence, it is disregarding of low immediate dividend yield.

The man who is convinced that the mail order houses, for example, are going to do increased business and to earn greater profits because they are working a major economy in retail merchandising is not deterred by any figuring that their present dividend to himself as a stockholder will be only 3 per cent. And if he is investing his own money he will be quite indifferent to a call rate of 8 per cent.

The same man will not touch the stocks of textile manufacturing companies with a ten-foot pole, for they offer nothing appealing to his imagination.

When we say "the public," we mean the composite judgment of the investors and business men of the country, and it may be sounder than that of academic experts. The present speculative era does not look at this stage like one that involves the flyers of milliners, actresses and small tradesmen. It is more an expression of confidence in the growth of the country and a study of the new things which promise profits in producing goods and services that are wanted by an increasing population.

At the same time it is not exempt from liability to the excesses which have brought unpleasant reckonings on other occasions. Even the best reasoned upward movements, with all the resources and brains that have been behind them, have attracted an unthinking but highly impressionable following which eventually proves their undoing.

AUTOMOBILE and motor truck exports from the United States have grown this year to an extent quite justifying the industry's assiduous cultivation of foreign fields. To Aug. 1, 233,200 passenger cars had been sent abroad, an increase of about 30 per cent over

the 179,100 cars exported in the like period of 1927. There has been a 12 per cent increase this year in exports of motor trucks—71,700 against 63,900 last year for the seven months. A continuance of passenger car exports at the rate of the first seven months would give a year's total around 400,000, which is somewhat more than the largest month's output the industry has had. Similarly, a continuance of the seven months' average of motor truck exports would mean that about 25 per cent of the year's output had gone abroad. At such proportions, this branch of our export trade means much to the steel and foundry industries, accounting for no small part of the year's increased demand for sheet and bar steel, alloy steel and forgings, as well as copper, tin and other metals.

Steel Consuming Records

AS the time of the presidential election approaches the tonnage of steel is making a still more favorable showing. In this department of THE IRON AGE of June 21, under the caption "An Active Presidential Year," it was pointed out that half the year was virtually ended and had "made a very fair showing" in trade generally. Now we are less than one-third as far away from the election and the showing is still better.

Three items as to steel consumption are of particular interest in this connection. Fabricated structural steel lettings as reported for August at 356,250 net tons made a new high record for any month, and shipments at 300,000 net tons also made a new high record for any month. Production of automobiles and trucks in the United States, reported at 458,429 for August, also made a new high record for any month. Production of the agricultural implement industry in this year as a whole is making a new high record, by a substantial margin.

Now and then it is said there are those who argue that members of one of the political parties have a desire in presidential years to manufacture prosperity for its influence upon the election. That might be theoretically applicable to fabricated structural steel, but it fails utterly as to automobiles and agricultural implements. Members of both parties buy automobiles and the farmers are not known to have indulged in any concerted action to influence the election by buying farm implements. Their campaign activities follow a much less expensive course.

Barring a totally unexpected slump, steel ingot production this year, as we have pointed out, will make a new calendar year record, and it is no small thing in these post-war years for it to do this. In eight of the 15 pre-war years steel ingot production made a new high record, but six years elapsed after the war before the 1917 record was passed, 1925 accomplishing the feat. Then 1926 made another record, but 1927 fell below both those years.

Production in this year to Sept. 1 was above 1926 by nearly 4 per cent, and it is significant that July and August gained more over 1926 than did the first six months. One might venture to expect that the remaining months of this year will bring larger gains than 4 per cent over the same months of 1926, particularly as that year showed sharp declines in November and December from the October rate, while merely a 4 per

cent gain for the whole year seems a conservative guess. That would make 49,000,000 tons of ingots for the year, against 43,776,717 tons last year, 46,936,205 tons, the previous record, in 1926, 40,881,392 tons in the apparently boom year of 1920, and about 30,280,000 tons in both 1913 and 1912.

The reference is wholly to what is commonly called "steel," measured by the steel ingot. Steel castings have not been doing particularly well. Rolled iron had dropped from 1,678,257 tons in 1913 to 544,344 tons last year. Iron castings have had little growth in the last 15 years or more. Some of the gain in steel has been at the expense of other ferrous products. There are, however, gains in the total of all ferrous products. It is a detail that on account of increasing supplies of scrap the gains in pig iron are smaller. Pig iron made a new record in 1923, and this year will run 20 to 25 per cent above the mean of 1912 and 1913.

Quantity Discounts on Steel

QUITE a while ago the suggestion was made that steel mills might well arrange quantity discounts on some of their products, merchant bars being particularly mentioned. Nothing came of the suggestion, but the success mills have had in the last year with various changes in sales terms indicates that the possibility of making this one has greatly increased. The wire mills established a new and better proportioned card of size extras on nails; the bar mills adopted lump sum extras for small quantities of a size; the sheet and cold rolled strip mills are revising their cash discount, and in various other ways sales practice has been changed.

The essence of the proposed quantity discount is that it relates the price received to the actual cost of production. It would be made in accordance with the quantity of one section (and one analysis or quality) specified for shipment at one time. A mill cost is reduced when there is a run of a given length. Sometimes mills can make the saving by combining specifications, sometimes they can not. Frequently the cus-

tomer could arrange a larger specification if it were to his advantage. Many customers now furnish such runs but do not obtain an advantage by doing so.

Some mills have definitely expressed a desire to get away from the idea that the total purchases in a year should influence the price. The majority of their customers, in point of number, heartily agree with this view. The customer desires to be on even terms with his competitor, and the smaller buyer naturally asks the mill how he is expected to grow if his larger competitor secures cheaper raw material. With the proposed system, the smaller buyer would specify less frequently, thus accumulating sufficient demand for a given size to obtain the quantity discount.

Some efforts to realine prices have failed, probably because they merely named an invariable quantity, irrespective of size, requisite to command the discount. In merchant bars, to illustrate, there should be one tonnage in case of half-inch rounds and a much larger tonnage in case of four-inch rounds, to command the discount. A carload of half-inch rounds makes quite an order for a mill; a carload of four-inch rounds is relatively a small thing.

Inasmuch as there is already an extensive card of extras on bars, according to section and size, it would not be hard to introduce an additional column or columns to indicate the amount to be specified for shipment at one time in order to command a quantity discount. These figures would be determined by a study of mill costs. The saving in cost would be shared between the producer and the customer.

Such a system would help the trade get away from the condition of there being different bases for invoice prices at a given time according to the class of trade, something that has always been difficult to handle. In the old days, when market prices had the way of advancing by successive stages, the matter of preference was handled in large part by giving the preferred buyers contracts farther ahead. The system was crude but it seemed to work rather well. Conditions are different now, as forward business is no longer done to the same extent, and new practice is needed to cover the point that production costs vary according to the length of the run on a given size and section.

CORRESPONDENCE

Dwight and Lloyd-Greenawalt Patent Litigation

To the Editor: In your issue of Sept. 13, page 674, is a statement purporting to be an account of the litigation between the Dwight & Lloyd Sintering Co. and myself. I consider this statement not only very unfair to me, but also unfair to your numerous readers who have been vitally interested in this litigation. Therefore I am inclosing you a copy of the decision handed down by the Court of Appeals of this circuit, and also a copy of Judge Thacher's decision in the District Court.

The heading of your article is misleading, and you will notice that there is no truth whatever in the statement that Dwight and Lloyd are "recognized as the inventors of this contribution to the art and its importance acknowledged." The court did say that the Dwight and Lloyd apparatus went into extensive use, which is not denied by anyone.

Originally nine patents were involved, and the suit with reference to all of these was dismissed by Judge Thacher. No appeal was taken on two of the nine patents, leaving seven patents that were appealed. The basic Dwight and Lloyd patent was disposed of by the court on the basis of laches, so it was not necessary for the court to go into the question of infringement, the decision maintaining that "To allow them to hold in reserve this patent appears to us to invite just those delays which are so oppressive an incident to patent suits. If we are to recognize such an excuse, we weave one more thread in the mesh which entangles those who must pass through their mazes." Judge D. J. Thacher, in the original decision, said that "Assuming infringement, I am entirely satisfied that Greenawalt honestly believed he was not infringing. This belief was confirmed and encouraged by the plaintiff's acquiescence, with full knowledge and without objection, in all that he did."

The sintering pan patent is disposed of on the basis that it is invalid if infringed. The invalidity is based upon the Eldred patent, No. 885,328.

Two of the claims of the so-called "iron patent" are held invalid because "The process apparently appears to us completely anticipated by Heberlein's patent, No. 844,355. . . .

The merit of the invention (Dwight's) is its avoidance of silicates; it does not appear that merely to use the carbonaceous material when the ores did not contain their own combustible proved a great step in the art."

The other two claims of the iron patent were held invalid if infringed, the court holding that the matter so introduced was a new invention, also that "the delay was for over two years after Greenawalt's plant was in operation, and if his process involves temperature control at all, a disputed question, the amendment was too late."

Ignition claims in two of the Dwight patents are held invalid for the reason that the invention "was new matter which he was no longer entitled to claim since Greenawalt had already more than two years earlier been using such a process to set fire to the ore." The claims of the other ignition patent are held invalid because an application was renewed more than two years after the original application had been allowed.

You will notice that this is a sweeping decision in my favor, and that Dwight and Lloyd did not succeed in a single one of the numerous claims sued upon, and that four of the patents were invalidated and two more practically so.

JOHN E. GREENAWALT.

New York, Sept. 20.

[The title of the article of Sept. 13, to which Mr. Greenawalt takes exception, was "Dwight and Lloyd Patent Decision Affirmed." It did not say, as Mr. Greenawalt seems to imply, that the Dwight and Lloyd claims were sustained. The Court of Appeals did affirm the decision of the United States District Court, as is stated in the first sentence of the article, and that was practically all that with safety could be put into a headline, so complicated was the litigation and so hedged and qualified were various findings of the court.—EDITOR THE IRON AGE.]

Michigan College Studies Copper and Iron Ores

In 1927 the State Legislature appropriated to the Michigan College of Mining & Technology, Houghton, Mich., the sum of \$50,000 per year for two years, for research on iron and copper. The Governor found it necessary, despite his strong approval of the work, to cut the first year's appropriation to \$25,000, and this sum became available July 1, 1927. On June 27, 1928, the college was able to announce that the copper mining research, in cooperation with the United States Bureau of Mines, had demonstrated that the copper loss in the amygdaloid tailings could be reduced from 4½ lb. per ton to about 1½ lb. Dr. W. O. Hotchkiss, president, in an address before the Lake Superior Mining Institute, Sept. 7, said that these new findings will not only result in marked savings in present operations, but will enable many deposits formerly considered worthless to be opened or reworked.

A study of the possibility of removing sulphur from some of the high sulphur iron ores has been carried on for two years—first with funds supplied by mining companies and later with college research funds. While interesting scientific results have been obtained, nothing has yet been discovered that leads the investigators to hope for the solution of the economic problem.

The largest problem, and one which in Dr. Hotchkiss' opinion is a long and arduous one, is the problem of "manufacturing" iron ore from low grade deposits not of present economic value.

Type Metal Contracts During Solidification

Contrary to the general belief that type metal alloys expand during solidification, a research by Y. Matayama (directed by Professor K. Honda) indicates that a small contraction actually occurs during freezing, although less in amount than in many other metals. Good impressions are made in modern type machines more because a certain pressure is applied to the molten metal in the mold. Furthermore the surface tension of the type metal alloys is small, this being responsible for good fluidity and ready flow into finely engraved depressions in the mold. The

alloys used at present are also cheap and of low melting point; an improved metal must have these present characteristics and expansion during solidification as well.

A thermobalance was used to determine density at changing temperature. Results as published in *Science Reports*, Tohoku Imperial University, January, 1928, as shown in the accompanying table.

Mullite and Other Special Refractories

The possibilities resulting from the use of the sillimanite group of minerals, including cyanite and andalusite, for refractories has been a live subject in recent years. The physical and chemical properties of these materials are of a most promising nature. Their proper use in brick-making has, however, required careful study and the full merit of the present products has not been established in many types of service. Their field will broaden in the future, filling the positions that cannot be satisfactorily met by other materials. The comparative cost of the raw materials will necessarily limit their use and place them in the class of specialties, in the opinion of Stuart M. Phelps expressed in Technical Bulletin No. 21, American Refractories Institute.

A noteworthy refractory material of this class is the cast mullite. This product, which is simply a casting from an electric furnace melt, is of considerable interest. Raw materials of the composition necessary to produce mullite are used for the melt and after being cast the shapes are annealed. The finished product has almost no pore spaces and is, therefore, specially resistant to slag action. It has been found that the addition of low percentages of certain materials will substantially alter the properties of the finished casting, especially with regard to slag action. It is logical to expect that this principle will be applied to the manufacture of refractories of other compositions. Chrome, magnesite and spinel compositions made in this way should prove to be of value to the steel industry.

In recent years a highly calcined kaolin refractory has been marketed and like other special materials it is becoming established in certain limited uses. This product, by reason of the purity of the clay used in manufacturing and the exceedingly high temperature to which it is fired, possesses some unusual properties for clay refractories.

Alloy	Composition	Melting Point	Contraction During Solidification
Pure lead.....			3.4 per cent

Iron and Steel Markets

Rail Buying Movement Begins

Over 150,000 Tons of Rails Bought—Volume of Steel Business and Pressure for Deliveries Stiffen Price Situation

EXPANDING demands from the railroads, together with unabated pressure for material by the automobile industry, are strengthening the position of steel producers.

The inflow of business in the last month of this quarter has proved more than enough to sustain a high rate of output—it has resulted in a gain. The operations of Steel Corporation plants now average 85 per cent of ingot capacity, compared with 75 per cent a month ago. The rate of a leading independent is 86 per cent. Among the producing districts, Chicago, Pittsburgh and Youngstown alike have increased production, in each case reaching an average of close to 85 per cent.

Mill backlogs, after being built up by liberal specifications against expiring contracts, have been reinforced by orders for 155,500 tons of rails, mostly for winter rolling. Of this total the Louisville & Nashville bought 50,000 tons, the Chesapeake & Ohio 45,500 tons, the Union Pacific 40,000 tons and the Great Northern 15,000 tons. The New York Central and the Pennsylvania are expected to enter the market shortly for 200,000 tons each.

With the launching of the customary fall rail buying movement come more insistent reports that the railroads will soon make liberal purchases of rolling stock.

The large volume of business on the books and still coming, in some cases with increased emphasis on prompt shipment, has stiffened the mills' attitude on prices. The failure of producers to fix a uniform deadline for shipping orders against third quarter contracts for bars, plates, shapes and sheets caused confusion, which they hope to prevent three months hence by general adherence to Dec. 15 as the last day for specifications.

Now that specifying is drawing to a close for those mills that are accepting releases until the end of September, price uncertainty appears to be passing. While many buyers are not yet showing an interest in forward commitments, the number of fourth-quarter contracts so far closed is larger than expected.

At least one large user of bars succeeded in covering at 1.85c., Pittsburgh, but a preponderant number of contracts for bars, plates and shapes closed to date have brought 1.90c. to 2c., a full advance of \$2 a ton over third quarter figures.

Specifying was heaviest in sheets, and some buyers

are covered for fully 60 days; yet the price advances asked for fourth quarter are apparently not impeding contracting.

With some consumers, particularly the automobile industry, prices have become secondary to deliveries. The motor car makers, after setting a new monthly record for production in August, are taking more steel than ever before at this season and expect to maintain present operations through October. Mills face a pressure for shipments indicating that much of the steel now being rolled is passing directly into consumption. In certain instances buyers are dividing orders among several producers to insure deliveries when wanted.

The improved tone of prices of finished steel has extended to semi-finished material, and it now seems probable that fourth quarter contracts will carry advances of \$1 a ton on sheet bars and \$1 to \$2 a ton on billets and slabs.

A decline in inquiry for fabricated steel and backwardness of pending projects, reported from some market centers, has caused mills to extend protections on plain material and has raised doubts regarding the trend of construction activity.

In pig iron, the fourth quarter buying movement is largely over, although sales by Cleveland producers totaled 35,000 tons for the week. Fortified by liberal bookings, furnaces are holding firmly to recent price advances. Blast furnace stocks are being reduced, and, if demand holds at the present rate through the coming quarter, producers that had large accumulations early this year will have little stock iron left. Shipping orders from the automotive industry indicate that it will take as much iron next month as in September.

Scrap prices, although as a rule no longer rising, remain strong.

British makers of ferromanganese, according to our London cable, have raised prices \$5 a ton, to \$110, American seaboard, duty paid.

Copper advanced another ¼c. a lb. to 15.25c., delivered Connecticut Valley, on Sept. 24. Sales for the month establish a new recent record at over 200,000 net tons, of which 70,000 tons is for export.

THE IRON AGE composite price for pig iron has advanced for the third consecutive week, now standing at \$17.71 a gross ton, within 4c. of the highest level to date this year, reached in February. The finished steel composite remains unchanged for the eighth week at 2.348c. a lb.

Pittsburgh

Steel Orders and Specifications Exceeding Those of Last Month—High October Production Assured

PITTSBURGH, Sept. 25.—The steel market continues to disprove the theory that the exceptional summer activity was at the expense of fall business. In all finished products except wire products and tin plate, which usually are quiet at this time of the year, the report uniformly still is of maintained demand, with tonnage releases generally exceeding those of August.

In some cases the delivery promises of mills are not sufficiently prompt to bring them the orders. A buyer of bars seeking 100 tons of a size found it necessary to split the order between makers to insure delivery when wanted. The demand, particularly from the motor car builders or those serving them, is featured by its urgency. Steel consuming industries are normally busy for the time of year, and close observance of purchasing in strict accord with real needs has prevented any building of stocks.

Additional business stimulant is found in the continued effort of steel manufacturers to secure higher prices, to which was coupled the setting of a time limit as to acceptance of specifications on contracts. Although full success has not attended these efforts, the desire for better returns has not abated. Because a lack of uniformity as to the limiting date on third quarter contracts is held to be responsible for the failure of mills to gain their price objective, it is noted that they

are setting Dec. 10 or 15 as the deadline on specifications on fourth quarter contracts.

It is becoming apparent that steel manufacturers will have to be satisfied with a lower minimum than 2c., base, on fourth quarter bar, plate and shape business. Sheet makers are getting a good many fourth quarter contracts at the prices they named several weeks ago, but they also have much business taken at lower prices that will be an obligation against

fourth quarter production. The average prices on fourth quarter strips will not be materially higher than those of the second and third quarters of this year. An advance of \$1 to \$2 a ton in prices, plus the charges contained in the new card of chemical extras, is proposed on billets, slabs and sheet bars for shipment in the final quarter.

If there is a definite tendency to steel plant operations, it is upward, notably in the Youngstown district, which is feeling the full effect of heavy demand from the automotive industry and a good demand for seamless oil country pipe and for line pipe. The general average of ingot production is close to 85 per cent of capacity, with the independent companies doing somewhat better than the Steel Corporation plants. September production will show up strongly in comparison with either of the two preceding months, and there is promise of a good October from the momentum of this month, even should there be some abatement, as is expected, in automobile industry demands and a falling off in structural lettings.

Pig iron is not doing enough to provide a real test of the higher prices, which makers recently announced.

The advance in scrap has stopped with a decline of mill buying and the fact that the demand now is chiefly from dealers, who recently went short and who are naming prices calculated to net them a profit on their sales.

Pig Iron.—A moderate amount of business is being done in foundry iron and in all cases at the full quotation of \$17, Valley furnace, for the base grade. In other directions sales are few and small and provide no real test of prices. It is said that there is no basic iron to be had at less than \$16.50, Valley furnace, and one of the steel companies which ordinarily has some of this grade for sale has let it be known that it does not expect to have any for market during the remainder of the year on account of the size of its finished steel orders. However, no sales of this grade have yet been reported at more than \$16.25 and it is not easy to get users to bid even that price, as they are well covered and at the moment would be interested in additional supplies only as a speculation. The quotation of \$17 for basic iron may be interpreted merely as an announcement that those naming the price are out of the market. The actual price will probably be established when a steel foundry seeking 2000 tons for December shipment closes. No important sales of Bessemer and malleable iron are reported. The Republic Iron & Steel Co. is starting up its one idle Haselton stack to maintain pig iron production lost through the shutting down of the Trumbull-Cliffs furnace at Warren, Ohio. The Claire furnace, Reliance Coke & Furnace Co., Sharpsville, Pa., which it was said some time ago would be blown out Nov. 1 will probably be kept in blast to the end of the year or later.

Prices per gross ton, f.o.b. Valley furnace:

Basic	\$16.25 to \$17.00
Bessemer	17.25 to 17.50
Gray forge	16.50
No. 2 foundry.....	17.00
No. 3 foundry.....	16.50
Malleable	17.25 to 17.50
Low phos., copper free....	26.50

Freight rate to Pittsburgh or Cleveland district, \$1.76.

Hot-Rolled Flats.—Strip business is maintaining a surprisingly high rate,

with all makers in this area reporting tonnage releases to be well in excess of those of last month. This activity reflects the unusually high rate of motor car production. Reports that automobile manufacturers are figuring on as big a production in October as in this month are credited, but there is some doubt whether the orders for steel will hold up correspondingly. While the Ford Motor Co. is steadily expanding production, the maker of another low-priced car is winding up production of the present model and is yet to release much steel on the new model to come out about Nov. 1. Strip prices are steady at substantially the levels which ruled during the past two quarters. Prices also hold well on hoops and bands, in which business is fairly active.

Cold-Rolled Strips.—Business is active and prices are firm at 2.75c. to 2.85c., base, according to the size of buyer's requirements. These are practically the prices that have ruled during the past five months. It is said that sales at 2.65c., base, during that period were few and were for especially attractive tonnages.

Coke and Coal.—Cool weather is stimulating the demand for coal and coke for heating purposes. While heating coke is available at, as low as \$2.50 and commonly is selling at \$2.65, some buyers prefer standard furnace grade at a higher figure. This demand, plus the fill-in demand from pig iron producers, is keeping the market well cleaned up of spot supplies of furnace coke, and prices are firm. The demand for spot foundry coke is more active. Prices, though no higher, are firm. The coal market, particularly for slack grade, is still weak. Even in domestic sizes, for which demand is good, prices are kept down by abundant supplies.

Semi-Finished Steel.—Fourth quarter prices on billets, slabs and sheet bars are beginning to crystalize, and while all makers have not yet announced the new quotations, it is probable that the market will be established at \$33 for sheet bars, \$34 for 4 x 4-in. billets, or equivalent area of slabs, and \$35 for small billets and

slabs, with the size and chemical extras announced more than a month ago to apply. These prices represent an advance of \$1 a ton on sheet bars and from \$1 to \$2 a ton on billets and slabs over the third quarter contract prices. For that period the price of sheet bars was generally \$32, while on billets and slabs there were contracts carrying both \$32 and \$33. Incidentally, the new price setup reverses the former order in which sheet bars commanded a premium of \$1 a ton over billets. The base price of forging quality steel is still a little indefinite; some producers have renewed present arrangements carrying a base price of \$38 for the final quarter of the year, while others now quoting \$34, base, for billets are maintaining the former extra of \$5 a ton for forging quality, and one important producer has announced a base price of \$40. Non-integrated manufacturers are taking out steel freely on third quarter contracts and some of the strip makers are said to have sizable stocks of billets and slabs. The decline in billets, slabs and sheet bars in the third quarter was directly associated with heavy melting steel scrap at \$14 and basic pig iron at \$15.25; in the past month or so, heavy melting steel has advanced to \$17 and basic iron has actually sold \$1 a ton above its low point and now is held at \$17, Valley furnace. The higher prices on semi-finished steel also have a connection with the higher prices that are being sought for several of the finished products, since with higher raw material costs, those who buy their steel would be expected to take a firmer stand on the finished lines. Wire rods are steady at \$42, base Pittsburgh and Cleveland, for either prompt or fourth quarter shipment.

Bars, Plates and Shapes.—There continues to be heavy specifying against expiring third quarter contracts, and manufacturers are growing more confident of their ability to obtain some advance over third quarter contract prices on business for the final quarter of the year. The eagerness of buyers to get in specifications, which has made the past week an-

Above prices are for hot-rolled steel bars, forging quality. The ordinary differential for cold-drawn bars is 1c. per lb. higher. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis. For billets under 4 x 4 down to and including 2½ in. squares, the price is \$5 a gross ton above the 4 x 4 billet price.

Slabs with sectional area of 16 in. or over carry the billet price; slabs with sectional area of 12 in. to 16 in. carry a \$5 extra above the billet price and slabs with a sectional area under 12 in. carry the bar price.

Band sizes are 40c. per 100 lb. higher.

On carloads the above discounts on steel pipe are increased on black by one point, with supplementary discount of 5%, and on galvanized by 1½ points, with supplementary discount of 5%. On iron pipe, both black and galvanized, the above discounts are increased to jobbers by one point with supplementary discounts of 5 and 2½%.

Note.—Chicago district mills have a base two points less than the above discounts. Chicago delivered base is 2½ points less. Freight is figured from Pittsburgh, Lorain, Ohio, and Chicago district mills, the billing being from the point producing the lowest price to destination.

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.	

other big one for Pittsburgh district mills, is taken to mean that buyers expect to pay higher prices in the fourth quarter. Since all manufacturers did not insert a limiting clause as to when third quarter contract specifications must be in—and all deliveries against these contracts cannot be completed until after the turn of the fourth quarter—the actual prices for the final period are not yet clearly defined. Against reports that one large user of bars has been covered for the next quarter at under 1.90c., base Pittsburgh, are those that many larger users are signing up at 1.90c. and that the smaller consumers are contracting at 1.95c. and also at 2c. The price paid by individual buyers on third quarter contracts seems to govern the price they will be called upon to pay, not only for bars, but plates and shapes; a \$2 a ton advance is being sought.

Wire Products.—Nails still are slow, but there is a fairly good demand for most of the other wire products. Prices are steady here and are reported to be holding well in other markets.

Tubular Goods.—Seamless oil country pipe and oil and gas line pipe still are the bright spots in the tubular division of the market. While no additional pipe lines of size have lately been placed, most makers are well supplied with orders, and in seamless casing and drill pipe the demand still is strong, notably from southern California. Pipe for building construction and heating is only moderately active and lapwelded pipe for oil country consumption is very dull. Good demand still is noted for mechanical tubes from the motor car builders, but boiler tube business could be better.

Sheets.—There is no letdown in business or mill operations. The American Sheet & Tin Plate Co. last

week operated at 90 per cent of capacity and the general average of independent producers was not far from that mark. While the lower rate of discount to be allowed for cash in 10 days on and after Oct. 1 still is being objected to by jobbers and one of the larger motor car companies, the change is being accepted in other directions. It is also observed that the higher prices asked for fourth quarter on black, galvanized and blue annealed sheets are not impeding contracting for that period. Most buyers will enter the final quarter with lower-priced sheets due them, but those who have occasion to come into the market will doubtless find quotations firm at 2.75c., base, for black, 3.50c., base, for galvanized, and 2c., base, for blue annealed. There is still an urgency about shipping instructions that is taken to mean an absence of speculation in the present demand, and reports from the consuming industries generally are that they are normally busy for this time of the year, while the motor car industry is taking more tonnage than ever before at this season. That industry now is figuring on maintaining its present gait through next month.

Tin Plate.—Business and mill operations are tapering, as usual at this time of the year, but none of the makers expect that the dip this year will be severe, as the demand for general line tin plate is good and export business lately has been improving.

Cold-Finished Steel Bars and Shafting.—There is some resistance to 2.20c., base Pittsburgh, on fourth quarter contracts, but consumers generally are signing up at that figure. Specifications on third quarter contracts, meanwhile, remain heavy and evidence is lacking that the tonnages released are for other than immediate consumption.

Rails and Track Supplies.—The Pennsylvania Railroad is taking bids until Sept. 27 for 2500 tons of tie plates and 875 tons of spikes. The Chesapeake & Ohio Railroad has followed its recent spike award to a southern Ohio mill with another inquiry for 3000 kegs. In a prospective way, the market for track supplies is active, but current business is light. Light-section rails are slow, but standard-section rail requirements for 1929 are expected to begin reaching the market in the next week or 10 days.

Old Material.—The market has stopped advancing and its tone is a shade easier. Consumers who needed supplies are covered as a result of recent purchases and the only buyers are the dealers who took the orders. They are bidding \$16.50 to \$16.75 for heavy melting steel, and with no mill buying and one melter holding up shipments, they are getting fair-sized tonnages. But there are no offerings of railroad steel under \$17. The pressure for deliveries of scrap, which accompanied the August upturn in steel works operation and started the

scramble among dealers to cover short sales at advancing prices, has subsided materially. There is still a sizable short interest in steel works scrap, but whether this means still higher prices depends on whether there is another bulge in steel ingot production. There is usually a short interest in this grade, and it becomes acute when steel production is to be increased and there is a demand for deliveries from several consumers at the same time. Machine shop turnings are slightly easier, with \$11.75 now the top of the market, and on the blast furnace grades \$12.50 appears to be all that is obtainable, as against \$13, the recent top.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:	
Heavy melting steel.....	\$16.50 to \$17.00
Scrap rails	16.00 to 16.50
Compressed sheet steel....	16.50
Bundled sheets, sides and ends	15.00 to 15.50

Rails 3 ft. and under....	16.50 to 17.00

To Aid Industry in Securing Census Statistics

The American Management Association, 20 Vesey Street, New York, has appointed a committee to co-operate with the Government in planning the collection of official statistics on marketing and distribution with special reference to the 1930 census. H. A. Richmond, director marketing and distribution, Policyholders Service Bureau, Metropolitan Life Insurance Co., New York, is chairman of the committee. Companies or persons wishing the Government to gather certain statistics in connection with the 1930 census are requested to get in touch with the chairman and present suggestions.

The Oliver Iron & Steel Corporation, Morris & Bailey Division, Pittsburgh, announces the appointment of Edgar T. Ward's Sons Co., Pittsburgh, as its mill representative and warehouse distributor of cold-rolled strip steel in Indiana, Illinois, western Michigan, Wisconsin and Missouri.

Chicago

Steel Business Sufficient to Support 84 Per Cent Mill Operation—Rail Orders Total 100,000 Tons

CHICAGO, Sept. 25.—New business and specifications coming to Chicago district steel mills remain at the high level of recent weeks and are ample to support an ingot production at 84 per cent of capacity. The opening of fall rail buying, which in the week has totaled 100,000 tons, and the rather widespread belief that large railroad equipment purchases will be made before the end of the year offset to some extent the lack of confidence in the continuance of the present high demand from the building construction and automobile industries. Although deliveries of steel to automobile companies remain at a high rate, there is speculation as to how long this will continue. The sustained demand from the agricultural machinery industry is an important factor in the market.

Fourth quarter contracting is moving slowly. In fact, it is disappointingly small in total volume, considering that the turn of the quarter is less than a week away. Orders are larger in number, but smaller in size. Heavy specifications of recent weeks have resulted in the crowding of rolling schedules to the point where some third quarter tonnage will necessarily be delivered in October.

The No. 10 blast furnace at Gary, which was banked several weeks ago, has been brought back into service. There are now 24 active steel mill furnaces of 36 in this district.

Coke.—Shipments continue at a high rate and producers are drawing on stocks. Prices are firm at \$8 a ton, f.o.b. local ovens.

Bolts, Nuts and Rivets.—Fourth quarter contracting is practically completed. Prices are firm. Future obligations compare favorably both in number and size with commitments for the three months' period now ending. Specifications are a trifle lighter, but stocks held by farm machinery builders are reported low and increased releases from that source are expected early in October.

Pig Iron.—The local pig iron market continues to show a moderate amount of activity. Large inquiries, among which is included 1000 tons for a melter in Milwaukee, are less numerous, and, with fourth quarter requirements well covered, there is also a drop in the number and volume of spot orders. Prices are firm, as indicated by sales during the week. Several users are showing interest in first quarter iron. Sales of silvery iron are fairly active, and prices show greater strength. A boat carrying a cargo of iron which grounded several weeks ago in Lake Erie has not reached its destination at Milwaukee, and it is now reported that it has been unloaded at Detroit.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25..	\$18.50
N'th'n No. 1 fdy., sil. 2.25 to 2.75..	19.00
Malleable, not over 2.25 sil.....	18.50
High phosphorus	18.50
Lake Super. charcoal, sil. 1.50.....	27.04
So'th'n No. 2 fdy. (all rail).....	22.26
Low phos., sil. 1 to 2, copper free	\$28.50 to 29.00
Silvery, sil. 8 per cent.....	29.79
Bess. ferrosilicon, 14-15%.....	46.79

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Ferroalloys.—A carload of ferromanganese has been purchased by a Chicago user at \$105, seaboard. Prices for this commodity are strong, and there are intimations of advances for

first half deliveries. Users of ferrosilicon are issuing liberal specifications. An order for 250 tons of 19 to 21 per cent spiegeleisen has been placed at \$33 a ton, Hazard, Pa. This sale, as do others, indicates the stronger position of prices for this commodity.

Prices delivered Chicago: 80 per cent ferromanganese, \$112.56; 50 per cent ferrosilicon, \$83.50 to \$87.50; spiegeleisen, 19 to 21 per cent, \$40.76.

Plates.—Over 8000 tons of plates have been ordered from Western mills for oil storage tanks to be erected in the Southwest. There is in the making an inquiry for 8000 to 10,000 tons of oil tankage steel for a producer in California. This business has come into the market rather unexpectedly. Shipments of pipe made from plates are heavier and promise to expand further as releases are made against recent heavy tonnage contracts. Mills are now receiving specifications for the tonnage required for the Great Northern car orders, including the equipment to be built in this railroad's own shops. Otherwise, the railroad car market is unusually quiet. Reports heard a week ago that cars will come into the market in good number by December are now more persistent, though positive statements to this effect are not to be had. Wear and tear on equipment now in use, earnings of railroads and the replacement of old wooden cars are given as reasons for an expected buying movement. On the other hand, there is no shortage of cars and the stress of moving farm products probably has passed the peak. Prices for plates are steady at 2c. to 2.10c. per lb., Chicago. Deliveries are satisfactory to buyers, particularly since producers make a close study of rolling schedules and adjust shipments to meet the needs of users, even at the risk of crowding into October tonnages that were specified against third quarter contracts.

Mill prices on plates, per lb.: 2c. to 2.10c. base Chicago.

Bars.—Mild steel bar mills are operating at close to capacity. Two weeks of heavy specifications have extended deliveries. Rolling schedules

are better arranged, affording lower mill costs. Road machinery builders remain busy, and changes in the rate of specifying by the automobile industry are chargeable principally to new models. Orders from agricultural manufacturers indicate that they are enjoying the heaviest fall business on record. New buying is larger, and prices appear to be well established at 2c. to 2.10c. per lb., Chicago. Spot purchases of iron bars are more numerous, but forward buying is dull. Prices are unchanged at 2c., Chicago. Forward contracting in alloy steel bars has progressed rapidly this week, and indications are that the buying movement for the final period will be fully as heavy as for the third quarter. The total volume of specifications received in the last seven days compares favorably with shipments. Rail steel bars have been advanced \$2 a ton to 1.95c. per lb., Chicago Heights. This increase in price followed a steady buying movement, during which most of the quarterly contracts were closed. Shipments are steady, and both Chicago Heights mills continue to operate on double turn.

Mill prices per lb.: Soft steel bars, 2c. to 2.10c., base, Chicago; common bar iron, 2c., base, Chicago; rail steel bars, 1.85c. to 1.95c., base, Chicago Heights mill.

Structural Material.—Higher prices for fabricated material and tightening in building loans now appear as the major factors in holding the local structural demand in check. Prices asked by shops are not far from \$5 a ton higher than in midsummer. This advance is not all that fabricators had hoped to get, in view of small profit or none at all, and so at the moment they are holding rigidly to the gain already made. The backwardness of pending projects has made it necessary that mills give protection on the prices on which bids have been based. The deadline was originally set at Sept. 15, but that has now been pushed forward to Oct. 1 and even further extensions may be asked for. The contract for the Fine Arts Building, Chicago, calling for 5000 tons, will not come before the South Park Commissioners until about the middle of October. Revisions in the design of the Patterson Estate Building, Chicago, are delaying that project. Shops in Chicago and Milwaukee are busy, but backlogs are dwindling. Old projects, though numerous, are moving slowly, while new plans are few in number. Prices for structural material are steady at 2c. to 2.10c. per lb., Chicago.

Mill prices on plain material, per lb.: 2c. to 2.10c. base, Chicago.

Wire Products.—Not much can be said about the wire market other than that it is steady, but shows as yet very little of the impulse of fall buying. Forward purchasing has made some progress, and, judging by the character of orders and the insistence on prompt shipments, there is little room to suspect that speculation has entered this market. Mills are slowly building backlogs, the total at the

end of the third week in September having been larger by a fair margin than at the corresponding time a year ago. Specifications from the manufacturing trade are steady, but the needs of distributors are spotty and uncertain. The jobbing trade is developing slowly, being particularly spotty in the Central West and in the Northwest.

Rails and Track Supplies.—Rail purchases aggregate over 100,000 tons, of which 15,000 tons is for immediate delivery and the remainder is for shipment in November, December and in the early months of 1929. The Chesapeake & Ohio has ordered 45,500 tons, of which 39,000 tons will be rolled in Western mills. One-half of the 15,000 tons placed by the Great Northern will come to Chicago mills. The Union Pacific order for 40,000 tons will be divided, 30 per cent to local producers and the remainder to the Colorado mill. It is reported here that the Louisville & Nashville has ordered 50,000 tons of standard-section rails from the Tennessee Coal, Iron & Railroad Co. Recent purchases are affording steady operation of rail mills, the rate being about 50 per cent of capacity, and the annual repair period is no more definitely settled upon than it was a week ago. Sales of light rails are confined to scattered car lots. It is reported that two Western railroads are rapidly shaping their 1929 rail requirements. Business in track accessories is light and operations are pointing downward.

Prices f.o.b. mill, per gross ton: Standard-section open-hearth and Bess. rails, \$43; light rails, rolled from billets, \$36. *Per lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.15c.; angle bars, 2.75c.

Cold Rolled Bars.—Fourth quarter contracting is making rapid headway at prices that are well established at 2.20c. per lb., Chicago. Specifications have grown a trifle in the week and producers are operating steadily at 80 per cent of capacity.

Cast Iron Pipe.—The United States Cast Iron Pipe & Foundry Co. is re-

ported to have taken 725 tons of 42-in. pipe for Milwaukee at \$33, Birmingham, or \$41.50 a ton delivered. The market is quiet except for car lot orders. Delivery on small business is prompt. Contractors are anxious to complete work before cold weather and they are asking for rush shipments against old contracts.

Prices per net ton, deliv'd Chicago: Water pipe, 6-in. and over, \$42.20 to \$43.20; 4-in., \$46.20 to \$47.20; Class A and gas pipe, \$4 extra.

Old Material.—This market continues active, as many users buy to replace stocks that were depleted during the late summer months. Dealers are now willing to pay as high as \$13.75 a gross ton, delivered, for heavy melting steel for delivery against old obligations. Steel mills are drawing heavily against old commitments. In a number of cases producers are holding back supplies in anticipation of higher prices. Among railroad lists this week are 1800 tons offered by the Nickel Plate and 1500 tons by the Chicago, Milwaukee, St. Paul & Pacific.

Prices deliv'd Chicago district consumers:
Per Gross Ton

Basic Open-Hearth Grades:		
Heavy melting steel.....	\$13.00 to	\$13.50
Shoveling steel.....	13.00 to	13.50
Frogs, switches and guards, cut apart, and misc. rails	14.75 to	15.25
Hydraul. compressed sheets	11.50 to	12.00
Drop forge flashings.....	9.50 to	10.00
Forg'd, cast and r'l'd steel carwheels	16.50 to	17.00
Railr'd tires, charg. box size	16.50 to	17.00
Railr'd leaf spring cut apart	16.50 to	17.00
Acid Open-Hearth Grades:		
Steel couplers and knuckles	15.25 to	15.75
Coil springs	18.00 to	18.50
Electric Furnace Grades:		
Axle turnings	13.50 to	14.00
Low phos. punchings.....	15.50 to	16.00
Low phos. plate, 12 in. and under	15.00 to	15.50
Blast Furnace Grades:		
Axle turnings.....	11.00 to	11.50
Cast iron borings.....	10.00 to	10.50
Short shoveling turnings..	10.00 to	10.50
Machine shop turnings....	6.75 to	7.25
Rolling Mill Grades:		
Iron rails	14.75 to	15.25
Rerolling rails	16.00 to	16.50
Cupola Grades:		
Steel rails less than 3 ft..	17.00 to	17.50
Angle bars, steel.....	16.25 to	16.75
Cast iron carwheels.....	13.50 to	13.75

Malleable Grades:		
Railroad	15.00 to	15.50
Agricultural	12.50 to	13.00
Miscellaneous:		
*Relaying rails, 56 to 60 lb. heav.	23.00 to	25.00
*Relaying rails, 65 lb. and heav.	26.00 to	31.00

Per Net Ton		
Rolling Mill Grades:		
Iron angles and splice bars	14.50 to	15.00
Iron arch bars and transoms	20.00 to	20.50
Iron car axles.....	24.50 to	25.00
Steel car axles.....	16.25 to	16.75
No. 1 railroad wrought...	12.00 to	12.50
No. 2 railroad wrought...	11.50 to	12.00
No. 1 busheling.....	10.00 to	10.50
No. 2 busheling.....	5.75 to	6.25
Locomotive tires, smooth..	12.50 to	13.00
Pipes and flues.....	9.00 to	9.50

Cupola Grades:		
No. 1 machinery cast.....	15.00 to	15.50
No. 1 railroad cast.....	14.50 to	15.00
No. 1 agricultural cast....	13.00 to	13.50
Stove plate	11.25 to	11.75
Grate bars	12.25 to	12.75
Brake shoes	11.25 to	11.75

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Sheets.—Sheet prices are firm, and it is believed by some observers of the market that an advance is not far in the future. Spot sales are numerous and specifications are in such volume that deliveries have been extended. Hot mills are engaged at close to capacity.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 2.80c. to 2.90c.; No. 24 galv., 3.65c. to 3.75c.; No. 10 blue ann'l'd, 2.15c. to 2.25c. Deliv'd prices at other Western points are equal to the freight from Gary plus the mill prices, which are 5c. per 100 lb. lower than Chicago delivered prices.

Reinforcing Bars.—Large tonnage awards and inquiries are lacking. Competition is keener for small lots. Dealers are aiming for stability in prices on large orders for billet steel reinforcing bars. The level now sought is 2.30c. a lb., Chicago warehouse. Rail steel reinforcing bars have been advanced \$2 a ton by warehouses. The Great Lakes Construction Co. is low bidder on the general contract for the 124th Field Artillery Armory, Chicago. This bid, however, is far above the estimate of cost and it is probable that bids will be rejected. New business and fresh inquiries are shown on page 802.

Tin Plate.—Shipments to date are running a trifle heavier than in the corresponding part of the last half of 1927. Spot orders are fairly numerous at unchanged prices.

Railroad Equipment

Central of Vermont Will Buy 500 Freight Cars

PURCHASE of 100 gondola cars by the Western Maryland and of 20 locomotives by the Canadian National were the outstanding transactions of the week's business, details of which follow:

Belt Railway of Chicago has purchased five eight-wheel switching locomotives from Baldwin Locomotive Works.

Western Maryland has ordered 100 gondola cars from Bethlehem Steel Co.

Sanitary District of Chicago has purchased 16 30-yd. air-dump cars and four 20-yd. air-dump cars from Magor Car Co.

Pittsburgh & Shawmut has ordered four caboose cars from Pressed Steel Car Co.

American Oil Co., Baltimore, has ordered two three-compartment tank cars from General American Tank Car Corporation.

Denver & Salt Lake is inquiring for one business car.

Canadian National Railways have bought 20 of a total inquiry for 55 locomotives from American Locomotive Co.

Central of Vermont is inquiring for 500 automobile cars.

Steel Mill to Be Built in Oklahoma

The Tulsa Rolling Mill Co., Tulsa, Okla., has authorized construction of a new plant at Sand Springs, Okla., to consist of two main one-story units, 135 x 430 ft., and 132 x 135 ft., for rolling mill and open-hearth plant.

Warehouse Prices, f.o.b. Chicago

Base per Lb.	
Plates and structural shapes.....	3.10c.
Soft steel bars.....	3.00c.

Cement c't'd nails, base per keg.....	3.10

Philadelphia

Fourth Quarter Steel Contracting Light—Sheet Mills Well Filled—Further Scrap Advances

PHILADELPHIA, Sept. 25.—Contracting for fourth quarter is rather limited. Sheet mills are heavily booked with specifications for early delivery and in most cases have sufficient tonnage on their books to maintain a good rate of operation for the next 60 days. This situation has developed from the activity of consumers in anticipating their requirements before Oct. 1, so as to obtain the benefit of the 2 per cent discount for cash in 10 days, which is to be discontinued by the mills Oct. 1. In consequence, a real test of present prices, which are firm, is expected to develop later in the quarter when mills have less tonnage on their books. Some last quarter contracts for steel bars have been made, large preferred buyers securing 1.90c., Pittsburgh, and others 1.95c. and 2c., Pittsburgh. On the few plate contracts closed thus far, the price range has been from 2.05c., Coatesville, for preferred buyers to 2.15c., Coatesville, for smaller users.

Pig Iron.—Pig iron prices are firm at \$20, base furnace, on foundry grade, but with most consumers covered for the last quarter, and with sufficient iron in some instances to carry them over the first of the new year, no real test of the present prices has developed. Foundry iron buying is confined to small orders. There is a moderate demand for low phosphorus iron at unchanged prices. A large consumer at Trenton, N. J., is reported to have closed for a small tonnage of Bessemer iron with an eastern Pennsylvania steel company furnace.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.	\$20.76
East. Pa. No. 2X, 2.25 to 2.75 sil.	21.26
East. Pa. No. 1X.	21.76
Basic (del'd east. Pa.)	\$19.00 to 19.25
Gray forge.	19.75 to 20.25
Malleable.	21.00 to 21.50
Stand. low phos. (f.o.b. N. Y. State furnace)	22.00 to 23.00
Cop. b'r'g low phos. (f.o.b. furnace)	23.00 to 23.50
Va. No. 2 plain, 1.75 to 2.25 sil.	24.54
Va. No. 2X, 2.25 to 2.75 sil.	25.04

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to \$1.64 from eastern Pennsylvania furnaces; \$4.54 from Virginia furnaces.

Bars.—Mills are well booked with fourth quarter tonnage and have a large volume of specifications against present contracts. Fourth quarter commitments are being made at 1.90c., Pittsburgh, or 2.22c., Philadelphia, with large buyers, with 1.95c. to 2c., Pittsburgh, or 2.27c. to 2.32c., Philadelphia, applying on smaller contracts. Deliveries are extended, most mills promising not less than three to four weeks.

Shapes.—Although fabricated steel prices are stronger than for some time, there is little change in shape quotations. Contracts for fourth quarter have been made in a few instances at 2.11c., Philadelphia, or on a basis of 2.05c., Pencoyd, Pa. Tonnages are being delivered on recent contracts made at 1.95c., Pencoyd, or 2.01c., Philadelphia.

Plates.—Buyers are beginning to show some interest in contracts for last quarter, and in a few cases requirements have been covered at 2.05c., Coatesville, paid by large preferred buyers, to 2.15c., Coatesville, or 2.25c., Philadelphia, for the smaller

tonnages. With a number of desirable shipbuilding contracts in prospect, shipyards in this district are looking forward to more activity than in many months. Mills report that the railroads are specifying heavily against current contracts.

Sheets.—The volume of specifications and new contracts is smaller than that of the early part of the month, when buyers were endeavoring to secure the benefit of the 2 per cent discount for cash in 10 days, which terminates Oct. 1. Most mills are well booked for the next four to five weeks or longer and are maintaining the present price level firmly at 2c. to 2.10c., Pittsburgh, on blue annealed, 2.75c., Pittsburgh, on black, and 3.50c. to 3.60c., Pittsburgh, on galvanized. It is pointed out that a test of the strength of present prices may not develop until later in the fourth quarter, when mills have reduced the present backlog of tonnage on their books. Large consumers are said not to be accumulating stocks.

Warehouse Business.—There has not been much increase in the volume of buying during the month. September has been satisfactory, however, from the viewpoint of prices, which have been quite steady.

Imports.—In the week ended Sept. 22, 850 tons of Indian pig iron arrived at this port, also 2000 tons of

Warehouse Prices, f.o.b. Philadelphia

	Base per Lb.
Plates, $\frac{1}{4}$ -in. and heavier	2.60c.
Plates, $\frac{3}{8}$ -in.	2.80c.
Structural shapes	2.60c.
Soft steel bars, small shapes, iron bars (except bands)	2.70c.
Round-edge iron	3.50c.
Round-edge steel, iron finished $1\frac{1}{2}$ x $1\frac{1}{2}$ in.	3.50c.
Round-edge steel, planished	4.30c.
Reinforc. steel bars, sq. twisted and deform.	2.50c. to 2.75c.
Cold-fin. steel, rounds and hex.	3.45c.
Cold-fin. steel, sq. and flats.	3.95c.

†For 50 bundles or more; 10 to 49 bun., 4.95c. base; 1 to 9 bun., 5.30c. base.

chrome ore from Portuguese Africa and 35 tons of ferromanganese from the United Kingdom. Steel arrivals consisted of 334 tons of structural shapes from Belgium and 30 tons from France, 136 tons of steel bars from Belgium and 37 tons from France, 724 tons of steel blooms from France and 10 tons of steel hoops from the United Kingdom.

Old Material.—No. 1 heavy melting steel is unchanged at \$15.50 to \$16 per ton, delivered, but most other grades show advances of 50c. a ton or more. The market continues strong, but the recent rapid advance of prices, resulting from activity of dealers in filling contracts, has begun to diminish. Heavy breakable cast has been bought by an eastern Pennsylvania consumer at \$17 per ton, delivered, and stove plate has brought \$13 per ton, delivered. No. 2 melting steel has been sold at \$13 per ton to a Harrisburg mill.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel	\$15.50 to \$16.00
Scrap T rails	15.00 to 15.50
No. 2 heavy melting steel	12.50 to 13.00
No. 1 railroad wrought	15.50 to 16.00
Bundled sheets (for steel works)	11.00 to 11.50
Machine shop turnings (for steel works)	11.50
Heavy axle turnings (or equiv.)	12.50 to 13.50
Cast borings (for steel works and roll. mill)	11.00 to 11.50
Heavy breakable cast (for steel works)	16.50 to 17.00
Railroad grate bars	12.50 to 13.00
Stove plate (for steel works)	12.50 to 13.00
No. 1 low phos., hvy., 0.04% and under	18.00 to 19.00
Couplers and knuckles	16.50 to 17.00
Rolled steel wheels	16.50 to 17.00
No. 1 blast f'nace scrap	10.00
Wrot. iron and soft steel pipes and tubes (new specific.)	14.50 to 15.00
Shafting	19.00 to 20.00
Steel axles	22.00 to 23.00
No. 1 forge fire	11.00 to 11.50
Cast iron carwheels	16.50 to 17.00
No. 1 cast	17.00 to 17.50
Cast borings (for chem. plant)	14.50 to 15.00
Steel rails for rolling	15.50 to 16.00

Plan Session With Gear Manufacturers

One session of the semi-annual meeting of the American Gear Manufacturers Association, which will be held at the Statler Hotel, Buffalo, Oct. 11-13, will be in conjunction with the machine shop practice division of the American Society of Mechanical Engineers. It will be held on the evening of Oct. 13.

Papers on "High-Speed Gearing—Some Requirements and How They Are Attained Commercially" and "Pratt & Whitney Gear-Shaving Process," by Ira Short, Westinghouse Electric & Mfg. Co., Philadelphia, and H. D. Tanner, Pratt & Whitney Co., Hartford, respectively, will be presented.

For storing road building and snow removal machinery for the Pennsylvania highway department the Blaw-Knox Co., Pittsburgh, will supply 23 steel storage buildings, mostly 40 x 128 ft. in size.

Cleveland

Recent Steel Specifications Have Given Mills Large Backlogs—Contracting Now Being Done for Fourth Quarter

CLEVELAND, Sept. 25.—There has been a slight falling off in specifications for steel bars, plates and structural material in the past week, which is due to the shutting off by most of the mills of the acceptance of orders against third quarter contracts. With these specifications, mills have heavy backlogs. While consumers are not yet taking a great deal of interest in the fourth quarter, outside mills have already closed quite a few contracts for that delivery at the new prices of 1.90c. to 2c., Pittsburgh, for steel bars, plates and structural material and 1.95c. to 2.05c., Cleveland, for steel bars. Although local bar mills have not definitely named prices for the fourth quarter, they appear to be tending toward a 1.90c., Cleveland, base, at which some business has been taken. Some buyers of structural material and plates have secured protection at present prices for material for work that they are figuring on.

Some resistance to price advances has developed from automobile manufacturers in the Detroit territory. These have placed heavy orders for their October requirements. Most automobile companies are scheduling a heavy output for October. The Chevrolet Motor Car Co. has discontinued shipping orders for steel for its present models and is in the market for stampings for its new models, on which it is expected to get under production about Nov. 1. The slowing down by this company while it is changing over to new models will probably cause a noticeable temporary falling off in the demand for steel from the motor car industry, as the Chevrolet company has been operating on a schedule of over 5000 cars per day.

Lake shipyards have received an inquiry for two car ferries, each requiring 2800 tons of steel, this being the first inquiry from this source for new boats for several months.

Pig Iron.—Sales by Cleveland interests in the past week aggregated 35,000 tons, which was about the same as in the previous week. The activity was largely in western Ohio, Indiana and in the Buffalo district. Locally, the market is at a standstill, as most foundries are covered for the remainder of the year. The market has a firm tone, but there are no further changes in prices. Sales of foundry and malleable iron by Cleveland furnaces for outside shipment were made at \$17.50, establishing the recent 50c. a ton advance. Another Lake furnace, which is now on an \$18 base, made several sales at that price. In Michigan, prices range from \$18 to \$18.50, furnace. The outstanding

feature of the market is the continuance of the heavy demand. Shipments with some sellers this month so far show a gain over the corresponding period in August, which was a surprisingly good month. Shipping orders from the automotive industry indicate that automobile foundries will take as much iron in October as during the present month. Furnace stocks are being reduced considerably, and, if the demand holds up to present levels during the last quarter, furnaces that had large stock piles early in the year will have little iron in stock on Jan. 1.

Prices per gross ton at Cleveland:

N'th'n fdy., sil. 1.75 to 2.25	\$18.50
S'th'n fdy., sil. 1.75 to 2.25	22.25
Malleable	18.50
Ohio silvery, 8 per cent...	28.00
Basic Valley furnace....	\$16.50 to 17.00
Stand. low phos., V'ley fur.	26.50 to 27.00

Prices, except on basic and low phosphorus, are delivered Cleveland. Freight rates: 50c. from local furnaces; \$3 from Jackson, Ohio; \$6 from Birmingham.

Strip Steel.—Specifications for hot-rolled strip are keeping producers busy, although they do not have heavy backlogs. Large consumers are under contract for the last quarter at third quarter prices. Consumers of cold-rolled strip are rather slow in placing contracts. This product is quoted at 2.75c., Cleveland, to large buyers and at 2.85c. to small consumers.

Semi-Finished Steel.—Consumers are asking for fourth quarter quotations, but the price locally has not been definitely determined. Shipments are still being made against \$32 and \$33 contracts for sheet bars, billets and slabs.

Cold-Finished Steel Bars.—Consumers, particularly those making standard products, have specified heavily against third quarter contracts. Some fourth quarter contracts have been closed at 2.25c., Cleveland, or \$2 a ton above the current price. Makers are following some of the hot-rolled bar mills in setting Dec. 10 as the deadline for specifications against fourth quarter contracts.

Wire Products.—Wire continues to move well and is firm in price. Nails are rather quiet, and price irregularities still exist in some sections.

Reinforcing Bars.—The Nickel Plate

Railroad has placed 600 tons for track extension work in Cleveland. Inquiry is light. Efforts to get warehouse prices on higher levels are still being made, but so far have not met with much success.

Warehouse Business.—Some of the jobbers have announced that they will follow the mills in placing the one-half of 1 per cent discount in effect Oct. 1. Demand is fair, and there is little deviation from regular prices.

Sheets.—Quite a few current orders and contracts for the fourth quarter have been taken at the new prices of 2.75c., Pittsburgh, for black, 2c. for blue annealed and 3.50c. for galvanized. Sheet manufacturers appear satisfied with their efforts to get prices on a higher basis. Some of the mills are still taking specifications from contract customers who will be using sheets bought at the lower prices through October, so that the hardest test of the market may not come before the end of next month. Up to the present, the only deviation reported from the regular quoted prices is on blue annealed sheets. In Detroit, some of the large consumers in the automotive field have secured a 1.95c. price and a round-lot inquiry in this territory brought out a concession.

Old Material.—The market appears to have become fairly well stabilized at the prices that have prevailed recently. There is a moderate amount of activity on the part of dealers, who are paying \$14 for No. 1 heavy melting steel and \$10.50 for blast furnace scrap to cover short orders. While supplies are not excessive, dealers claim they are getting all the scrap they want at quoted prices. Large scrap lists for October are coming from the Michigan automobile plants. The lists already out include: Buick, 7300 tons; Dodge Brothers, 4600 tons, and Oakland, 2000 tons.

Prices per gross ton delivered consumers' yards:

Basic Open-Hearth Grades		
No. 1 heavy melting steel.	\$13.75 to	\$14.00
No. 2 heavy melting steel.	13.25 to	13.50

the by-product domestic coke market as a result of an increase in output. Detroit, which is a large consuming point, is rather commonly looked on as a dumping ground. Valley producers quote domestic coke at \$4.50 per ton ovens for egg and \$3.75 to \$4 for nut. The Cleveland delivered prices are \$6 for egg and \$5.50 for nut.

Bolts, Nuts and Rivets.—Bolt and

nut makers report that buyers are signing fourth quarter contracts freely at the present 70 per cent discount. Specifications are holding up to recent volume. Most of the tonnage contracted for during the quarter will be taken out. Stocks are low and prompt shipments are called for. Rivet consumers are beginning to send in fourth quarter contracts based on present prices.

New York

Buffalo Iron Now at \$17 Minimum in District—Steel Contracts Made for Fourth Quarter

NEW YORK, Sept. 25.—Demand for pig iron is declining, as is to be expected following general contracting for fourth quarter, but prices are still gaining in strength. Furnaces are well booked and, in some cases, have fallen behind somewhat in deliveries. Those producers selling on a Buffalo base, or the equivalent, are now uniformly adhering to a minimum of \$17, Buffalo, for No. 2 plain foundry iron. Foundry melt is holding its own, on the average, although there are still some jobbing foundries on an unsatisfactory operating basis. It is believed that the recent advance in pig iron prices stimulated castings orders, at the same time having a tendency to stiffen castings prices. While most melters have covered at least a substantial part of their fourth quarter needs, virtually no buying for first quarter has been reported. Buffalo furnaces, although not soliciting business for fourth quarter, have advanced prices 50c. a ton for that delivery. The Worthington Pump & Machinery Corporation, New York, has closed for 2000 tons for its Harrison, N. J., Holyoke, Mass., and Western plants. The American Radiator Co. has purchased 1500 to 2000 tons of foundry iron for its Gloucester, N. J., works. This company is completing extensive improvements to its blast furnace plant at North Tonawanda, N. Y.

Prices per gross ton, delivered New York district:

East. Pa. No. 2X fdy., sil.	2.25 to 2.75	21.39 to 22.52
East. Pa. No. 1X fdy., sil.	2.75 to 3.25	21.89 to 23.02

Freight rates: \$4.91 from Buffalo, \$1.39 to \$2.52 from eastern Pennsylvania.

*Price delivered to New Jersey cities having rate of \$3.28 a ton from Buffalo.

Ferroalloys.—The report in our British cable on another page that British producers of ferromanganese have increased their export price about £1 per ton has not yet been reflected in this market. The British advance would mean a price of \$110, seaboard, duty paid, but inquiry today has not uncovered any authorization for an advance above the prevailing

price of \$105. Sales in the past week of ferromanganese have been confined to carloads. In spiegeleisen one consumer took about 250 tons and there have also been sales of carloads and small lots, all for delivery this year.

Plates, Shapes and Bars.—Contracting for fourth quarter has started somewhat later than usual, but in the past week nearly all mills have covered a good many of their regular customers at prices ranging from 1.90c. to 2c., Pittsburgh, on bars and from 2.19½c. to 2.29½c., New York, on shapes and from 2.22½c. to 2.32½c., New York, on plates. The smaller contracts have in nearly all instances taken the top prices, representing a full advance of \$2 a ton. Some mills have restricted the 1.90c., Pittsburgh base, on steel bars to buyers using 1000 tons or more within the quarter. Although some consumers will be permitted to specify against third quarter contracts until the end of this week, most of the specifications are in. On purchases for delivery after Oct. 1, not covered by third quarter contracts, the new prices will apply. September specifications for bars and structural shapes in particular and to a lesser extent in plates will run large. The leading Eastern producer of structural material reports that its September tonnage will be the largest for any month this year. One of the first inquiries resulting from the damage done in Porto Rico by the recent hurricane is for 350 tons of plates for a penstock. The New York Central will receive bids up to Oct. 2 on its fourth quarter steel requirements, and the Delaware, Lackawanna & Western is taking bids this week on its needs for the rest of the year. The New York Central and Pennsylvania railroads are expected to come into the market within a week or two for their 1929 rail requirements, about 200,000 tons or more in each case.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.19c. to 2.24c.; plates, 2.17½c. to 2.22½c.; struc. shapes, 2.14½c. to 2.19½c.; bar iron, 2.14c.

Sheets and Strips.—Some mills are accepting orders this week for black sheets at 2.65c. and for galvanized sheets at 3.40c., Pittsburgh, but beginning Oct. 1 the new prices, which are \$2 a ton higher, will apply. In

view of the fact that nearly all buyers have sufficient sheets on order to provide for their requirements for a month or six weeks, little contracting for fourth quarter has been done. Hot-rolled strip steel buyers are covering for the remainder of the year at 1.90c., Pittsburgh, for 6 to 12 in., at 2c. for 3 to 6 in. and at 2.20c. for less than 3 in. The larger buyers of cold-rolled strip are having no difficulty in placing orders for last quarter requirements at 2.75c., Pittsburgh, although small buyers are being asked to pay 2.85c.

Warehouse Business.—Jobbers report a decided improvement in the volume of orders in the past week, but some price shading is still in evidence, especially on sheets and structural material. The improved situation at the mills is viewed with satisfaction by warehouse sellers, who expect as a result an increasing volume of prompt shipment business and a firmer tone in their prices.

Cast Iron Prices.—Southern makers of pressure pipe have announced an advance in the Birmingham price of \$2 a ton to \$36 to \$37 per ton, base. Northern foundries, however, continued to quote from \$35.60 to \$36.60 per net ton, delivered New York. Buying is almost entirely of small lots, many of less than 100 tons, to complete installations. Utility companies are providing most of the present activity.

Prices per net ton, deliv'd New York:
Water pipe, 6-in. and larger, \$35.60 to \$36.60; 4-in. and 5-in., \$40.60 to \$41.60; 3-in., \$50.60 to \$51.60; Class A and gas pipe, \$4 to \$5 extra.

Reinforcing Bars.—More than 2000 tons of bars was placed during the week for jobs of 100 tons or more, and the general run of small orders was considerably heavier than usual. This is attributed to the advance of \$2 a ton in price which is to be effective Oct. 1. A number of large jobs now under active negotiation will probably be closed before that date. Pending work continues to accumulate. Foundations for a bridge over the Kill van Kull connecting Staten Island and New Jersey will require about 500 tons and 400 tons will be needed for a building for the Brooklyn Ash Removal Co., Inc., in Brooklyn. About 550 tons of bars for another building for this company has been let to the McClintic-Marshall Co.

Coke.—Standard furnace coke prices are strong. For delivery into the next quarter, producers are asking about \$3 per net ton, Connellsville, with \$3.25 per ton asked on contracts for delivery over the entire quarter. For prompt shipment the usual market is \$2.85 per ton. Standard foundry coke is quiet at \$3.50 per ton, Connellsville. Special brands are still quoted at \$4.85 per ton, ovens, or at \$8.56 per ton delivered to northern New Jersey and Newark and \$9.44 to New York and Brooklyn. By-product foundry coke prices are \$9 to \$9.40, Newark or Jersey City, and \$10.06, New York or Brooklyn.

Old Material.—Prices on most grades show a further slight advance on the basis of offers by dealers and brokers, but the extreme activity caused by the covering on lower priced contracts has begun to decrease. No. 1 heavy melting steel is quoted at \$14 per ton, delivered Bethlehem, and \$15, delivered Coatesville, Pa., and Claymont, Del. Yard grade of heavy melting steel is being bought at \$11.75 per ton, Pottsville, \$12.50 per ton, delivered Harrisburg and Phoenixville, Pa., while as much as \$12.75 has been offered by some brokers.

Stove plate for steel works is quoted by dealers at \$12.50 per ton, delivered, machine shop turnings at \$11.50 per ton, delivered, and heavy breakable cast at \$16.50 per ton, delivered Harrisburg, Pa., and Florence, N. J.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel.	\$11.50
Heavy melting steel (yard)	\$8.00 to 9.00
No. 1 hvy. breakable cast.	12.50 to 13.50
Stove plate (steel works).	8.75 to 9.00
Locomotive grate bars....	9.25 to 9.75
Machine shop turnings....	7.50
Short shoveling turnings..	7.50
Cast borings (blast furn. or steel works)	6.50 to 7.50
Mixed borings and turnings	6.00 to 6.50
Steel car axles.....	18.00 to 18.50
Iron car axles.....	24.75 to 25.75
Iron and steel pipe (1 in. dia., not under 2 ft. long)	10.75
Forge fire	7.25 to 7.75
No. 1 railroad wrought...	10.75 to 11.25
No. 1 yard wrot., long....	8.75 to 9.25
Rails for rolling.....	11.50 to 12.00
Cast iron carwheels.....	13.00 to 13.50
Stove plate (foundry)....	9.00 to 9.50
Malleable cast (railroad).	10.00
Cast borings (chemical)...	11.25

Prices per gross ton, deliv'd local foundries:

No. 1 machy. cast.....	\$16.50
No. 1 hvy. cast (columns, bldg. materials, etc.) cupola size	14.50
No. 2 cast (radiators, cast boilers, etc.)	14.00

Bethlehem Objects to Proposed Water Freight Rates

H. G. Crawford, traffic manager Bethlehem Steel Co., voiced the objections of that company to rail and water rates from Eastern ports to the Southwest proposed by the Interstate Commerce Commission in the Southwestern rate case at a hearing at the rooms of the Merchants' Association of New York on Tuesday.

"The proposed basis as set forth by the commission," he said, "would either minimize our shipments to Houston and Galveston or force us to use unregulated lines or outside charters, with at least some penalty to the purchaser who had built up his business on the service accorded by the standard lines.

"Moreover, it would reduce the spread to which our Eastern location entitles us as compared with shipments originating in the Pittsburgh district and create an artificially high basis which is bound to affect us adversely in the competition we must face at the Gulf ports.

"To the Eastern producer the rail-ocean rates are of first importance, and their level controls in a large measure his ability to market his steel at Texas ports. I have previously pointed out that every steel manufacturer in Eastern territory is within 100 miles of New York, Philadelphia or Baltimore. The rail haul is therefore relatively short, as compared with the water haul, and the water rate has not for many years exceeded the 30c. level. Business is actively solicited on this basis.

"Most of the points reached by ocean-rail routes from Eastern producing points to Texas destinations are subject to the seaboard territory

blanket rates of 87c. for 100 lb. as a maximum. This rate covers a wide range in both trunk line and Southwestern territory.

"The blanket rate idea is wrong in principle. It produces gross inequalities as between origin points. It holds down the long haul rate and gives no corresponding reduction to the shorter haul. As applied to Trunk Line-Texas traffic, it acts as a distinct handicap to Eastern manufacturers and deprives them of the benefits that would accrue to an Eastern location. It brings the Pittsburgh producer, through the application of a special rate concession, to the very threshold of our Eastern plants, without imposing upon him any of the disadvantages of an Eastern mill. We oppose the present adjustment as wholly illogical and unfair and urge its abolishment in any final realignment made as the result of this hearing."

Standard Proposed for Brass Seated Unions

WASHINGTON, Sept. 25.—A proposed commercial standard for black and galvanized types of brass seated malleable iron or steel screwed unions for use with standard weight pipe was approved at a general conference here yesterday held under the auspices of the commercial standards unit of the Bureau of Standards, Department of Commerce. It was agreed that new production, in accordance with the schedule as defined by the standard, would be in order May 1, 1929, with an extension until Nov. 1, 1929, for industry to use up existing stocks.

The standard will be subject to annual review by a standing committee so that it may be kept abreast of any changes taking place in the art. Members of this standing committee are: Robert E. Bryant, Jefferson Union Co., Lockport, N. Y.; Myron H. S. Affleck, Star Mfg. Co., Providence, R. I.; Stanley G. Cady, Rhode Island Fittings Co., Providence, representing the manufacturers; the Standard Sanitary Mfg. Co., Fleck Brothers, the General Fire Extinguisher Co., and the Hajoca Corporation, Philadelphia, representing the distributors; the Master Plumbers' Association, the Master Steamfitters' Association, the American Gas Co., and the Heating and Piping Contractors National Association, representing the consumers.

Pipe Plant in Prospect at Everett Furnace

An arrangement has been pending between the Warren Foundry & Pipe Co., Phillipsburg, N. J., and the Mystic Iron Works, Everett, Mass., for the establishment by the former company of a foundry for small sizes of cast iron bell and spigot pipe close to the furnace. Property has not been acquired for this purpose, final action awaiting decision of the city to close permanently certain streets now traversing the site.

St. Louis

Increase in Pig Iron Buying Follows Price Advance—Steel Specifications Satisfactory—Price Gains in Scrap

ST. LOUIS, Sept. 25.—A marked improvement in buying of pig iron has followed recent price advances. Consumers seemingly are more impressed with the strength of the price situation. The St. Louis Gas & Coke Corporation sold 7600 tons at the 50c. advance announced Sept. 14; the largest lot was 4300 tons of foundry iron bought by a radiator company. An East Side melter took 1000 tons and an Iowa jobber bought 400 tons of foundry grades, while 600 tons of low phosphorus iron went to a Southern pipe manufacturer. A local melter purchased 300 tons of malleable. The stove interests in Belleville, Quincy and St. Louis, especially those concentrating on novelty types of enameled heaters, are busy, as are jobbing foundries specializing in light castings. Tractor manufacturers are operating at full capacity and are planning to increase production. September shipments of pig iron promise to exceed those of August.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25, f.o.b.	
Granite City, Ill.	\$19.50 to \$20.00
N'th'n No. 2 fdy., deliv'd St. Louis.	20.16
Southern No. 2 fdy., deliv'd	20.67
Northern malleable, deliv'd	20.16
Northern basic, deliv'd	20.16

Freight rates: 81c. Granite City to St. Louis; \$2.16 from Chicago; \$4.42 from Birmingham.

Coke.—Buying of domestic grades of coke has been stimulated by cooler weather, and it is expected that it will steadily increase from now on. Takings of metallurgical coke are increasing.

Finished Iron and Steel.—Jobbers of sheets have been more active in placing orders with mills within the last few weeks in an effort to get in under the wire before the discount rate is cut from 2 per cent to one-half of 1 per cent. Orders received this week by some interests will bear the lower discount. Specifications for plates, shapes and bars have been satisfac-

tory. Business with structural fabricators is quiet. The American Bridge Co. got the only award, 400 tons for a new zinc plant at East St. Louis. Warehouse business was lighter than in the preceding week.

Old Material.—The market for old material made further price gains during the week. Dealers are paying more for some items to cover contracts and also in anticipation of higher prices being paid by consumers. However, the mills are not buying except for immediate needs, and are showing slight interest in the market. Heavy melting steel, heavy shoveling steel, railroad springs, No. 2 railroad wrought, are up 25c., while machine shop turnings, rails for rolling, iron car axles, and No. 1 machinery cast are 50c. higher; railroad malleable is 75c. up and wrought iron bars and transoms are \$1 higher.

Railroad lists are the lightest in months, and shipments of material from other sources are small. Railroad lists include: International-Great Northern, three carloads; Frisco Lines, seven carloads, and Chicago, Milwaukee, St. Paul & Pacific, 10 carloads.

Dealers' buying prices, per gross ton, f.o.b. St. Louis district:

Heavy melting steel.....	\$12.00 to \$12.50
No. 1 locomotive tires....	12.50 to 13.00
Heavy shoveling steel.....	12.00 to 12.50
Miscel. stand-sec. rails	
includ'g frogs, sw'ches	
and guards, cut apart..	13.25 to 13.75
Railroad springs.....	14.50 to 15.00

Relay. rails, 60 lb. and	
under	20.50 to 23.50
Relay. rails, 70 lb. and	
over	26.50 to 29.00

Boston

Export Scrap Market Is More Active—Pig Iron Sales Drop Off—Coke Demand Good

BOSTON, Sept. 25.—The past week in the pig iron market was one of the quietest this year. Most of the large melters have covered fourth quarter requirements but none has bought for first quarter. Current sales are to small foundries which overstayed the market and which are reluctant to pay advanced prices, or larger foundries needing special brands for mixture purposes. Recent sales included Alabama, Buffalo, Champlain, Mystic, Pennsylvania and some imported irons. Sales of Mystic iron were the smallest in many weeks. Based on the present rate of New England melt, next month should bring a resumption of buying for fourth quarter and also some first quarter buying. It is believed that first quarter buying will run at least 50 per cent ahead of that for first quarter of this year.

Foundry iron prices per gross ton deliv'd to most New England points:

*Buffalo, sil. 1.75 to 2.25..	\$21.91
*Buffalo, sil. 2.25 to 2.75..	\$21.91 to 22.41
†Buffalo, sil. 1.75 to 2.25..	20.78
†Buffalo, sil. 2.25 to 2.75..	20.78 to 21.28
East. Penn., sil. 1.75 to 2.25	23.65
East. Penn., sil. 2.25 to 2.75	24.15
Va., sil. 1.75 to 2.25.....	25.71
Va., sil. 2.25 to 2.75.....	26.21
Ala., sil. 1.75 to 2.25.....	23.16 to 25.02
Ala., sil. 2.25 to 2.75.....	23.66 to 25.52

Freight rates: \$4.91 all rail and \$3.78 rail and water from Buffalo; \$3.65 from eastern Pennsylvania; \$5.21 all rail from Virginia; \$6.91 to 8.77 from Alabama.

*All rail rate. †Rail and water rate.

Imports.—During the first half of September, 1278 tons of foreign pig iron was received at Boston, consisting of 534 tons of Dutch, 644 tons of

Indian and 100 tons of Scotch. On Sept. 15, 10,030 tons of Wabana ore arrived at the Mystic Iron Works, Everett, Mass.

Coke.—New England ovens have increased their foundry coke output and have made some progress toward catching up on back orders. Indications are the ovens will make no change in their contract price of \$11 a ton delivered, within a \$3.10 freight

rate zone on Oct. 1. That price has not been changed since early this year. Domestic coke is selling in volume. A record turnover in domestic fuel by the New England Coal & Coke Co. and the Providence Gas Co. is expected. The New Haven coke plant is not yet in production.

Cast Iron Pipe.—Massachusetts will close bids Sept. 26 on 316 tons of 6, 8 and 10-in. pipe and 12 tons of special fittings for the new State Hospital at Waltham, Mass. Harry T. Stephens, United Bank Building, 152 Market Street, Paterson, N. J., is in the market for 1200 ft. of 6-in. pipe for a Massachusetts water works. Private pipe business continues in good volume, although it is not as heavy as a week ago. Pipe makers are still willing to make sizable concessions on large pipe because they are not sold ahead to the extent they were a year ago. They are well filled up with small pipe business; consequently prices on these sizes are quite firm. A small consignment, 135 pieces, of cast iron pipe from Antwerp was unloaded in Boston recently, the first importation of pipe here since September, 1927.

Fabricated Steel.—Prospective fabricated steel business has dropped off in the past month and shops will have to curtail operations in the fourth quarter unless new business develops. Two months ago it was believed they had sufficient backlogs to carry them through 1928, but, with a slowing up in new work and high operating schedules, jobs have been completed sooner than was expected. It is probable that the United Shoe Machinery Corporation's new building in Boston and a large downtown office building

will come up for figuring within two months.

Old Material.—The upswing in old material prices has been checked, temporarily at least. Brokers are still moving sizable tonnages out of New England, mostly into the Pittsburgh territory. Yards adjacent to New England foundries are disposing of considerable machinery and textile cast, although the supply of the latter has materially dropped within the past two months. In addition, sizable tonnages of No. 1 machinery cast are going to the Pittsburgh district. A local broker is loading 3000 tons of street railway rails, automobile scrap and other material for Baltimore. It is intimated that this material is going to Europe. Within the next week or two a steamer will load several thousand tons of scrap, mostly automobile, at Boston for export to Danzig. New England will probably ship many thousands of tons of scrap abroad between now and Jan. 1.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel	\$10.50 to \$10.75
Scrap T rails	10.00 to 10.50
Scrap girder rails	9.50 to 10.00
No. 1 railroad wrought	9.00 to 9.50
No. 1 yard wrought	8.00 to 8.50
Machine shop turnings	6.00 to 6.50
Cast iron borings (steel works and rolling mill)	6.00 to 6.50
Bundled skeleton, long	8.00 to 8.50
Forge flashings	8.50 to 9.00
Blast furnace borings and turnings	6.00 to 6.50
Forge scrap	6.00 to 6.50
Shafting	14.00 to 14.50
Steel car axles	15.50 to 16.00
Wrought pipe 1 in. in diameter (over 2 ft. long)	9.00 to 9.50
Rails for rolling	9.50 to 10.00
Cast iron borings, chemical	9.50 to 10.00
<i>Prices per gross ton deliv'd consumers' yards:</i>	
Textile cast	\$14.00 to \$14.50
No. 1 machinery cast	15.50 to 16.00
No. 2 machinery cast	13.50 to 14.00
Stove plate	10.00 to 10.50
Railroad malleable	15.00 to 15.50

rational subsidiaries; strip mills are operating at nearly 100 per cent.

The Sharpsville Furnace Co. plans to blow in this fall its merchant stack, idle since June; the Struthers Furnace Co. may start its merchant furnace, idle most of the year; the A. M. Byers Co., Pittsburgh, is also scheduled to operate its Mattie blast furnace at Girard. The Sheet & Tube company will take off one of its two active furnaces in its Brier Hill group.

The Republic Iron & Steel Co. is making constant minor improvements at its Warren properties, acquired by purchase of the Trumbull Steel Co. It is also preparing for the operation of Steel & Tubes, Inc., recently purchased. Under the new management, the company has introduced drastic economies in the operation of its plants.

The Sharon Steel Hoop Co. has made trial runs of new cold-strip steel installations at Sharon, Pa., which will get into production during the year's final quarter.

The Byers company is increasing the production of puddled iron by the Aston process at its leased plant in Warren, and the successful production of this iron on a commercial basis is creating wide interest. However, heavy expenditures will have to be made by the company for the conversion of its product into finished or rolled form.

European Open-Hearth Output Large, Exports Small

HAMBURG, GERMANY, Sept. 8.—While the use of open-hearth steel in Continental steel-producing countries is rather large in some instances, exports of this grade are insignificant. In Germany, the relation of Thomas steel to open-hearth steel production is 45 to 55, but in export business the relation is about 90 to 10, except for plates, on which the ratio is 60 to 40. Obviously, German manufacturers consume practically all the German open-hearth production, some of which is exported in the form of machinery and hardware products.

Output of Thomas and open-hearth steel in Luxemburg is in a ratio of 98 to 2, and no open-hearth grade is exported. In Belgium, the relation of Thomas to open-hearth production is 80 to 20 and in export sales it is 98 to 2. Of the average French production of nearly 800,000 tons of steel monthly, about 75 per cent is Thomas steel, while that grade represents 95 per cent of total exports. In Poland, 65 per cent of the total steel output is open-hearth metal. In export trade, however, only about 35 per cent of its shipments is open-hearth steel and the rest is Thomas grade. Czechoslovakia exports about 40,000 tons of steel monthly, of which more than 90 per cent is Thomas quality, whereas 40 per cent of the 100,000 tons of steel produced each month is open-hearth grade.

Youngstown

Market Developments Encouraging to Valley Producers—Unfilled Tonnage Larger Than at Opening of Third Quarter

YOUNGSTOWN, Sept. 25.—There is a distinct note of encouragement in the iron and steel trade developments affecting this area. Production schedules are climbing and the price structure is strengthening. Output in the Mahoning Valley reaches a peak for the year in the last week of the third quarter. The independent industry enters the fourth quarter with larger unfilled tonnages than at the beginning of the third quarter. Sheet makers are booked four to six weeks ahead. Producers of full-finished sheets expect to operate at a capacity rate well into November. Black sheets are strengthening at 2.75c.

It is safe to say that not at any time this year have prospects for the steel industry in northeastern Ohio been so favorable as they are now. The August payroll of over \$7,000,000 established a new monthly record for the year. Third quarter earnings of independent steel companies will be

larger than for either of the two preceding quarters, thus reversing the situation which ordinarily prevails in this respect.

The Republic Iron & Steel Co. adds this week a blast furnace in its Haselton group, anticipating the blowing out for repairs and relining of the stack at Warren operated by the Trumbull-Cliffs Furnace Co. This resumption gives the Republic company four active furnaces in the Haselton group.

The Youngstown Sheet & Tube Co. is averaging 78 per cent operation at all of its properties, and is at 83 per cent in the Youngstown district. Its seamless tube mills are on double turn. Of 20 tube mills in this area, 15 are under power; 113 of 127 sheet mills are rolling; independent tin mills are active at close to a capacity rate; bar mills are operating at 65 per cent with the independents, and at 75 per cent with the Steel Corpo-

Pacific Coast

Cast Iron Pipe Leads in Activity—Fair Volume of Business in Steel Products

SAN FRANCISCO, Sept. 22 (*By Air Mail.*)—Awards of steel products during the past week were by no means heavy, but a fair volume of business is pending. The cast iron pipe market was the most active and three fair-sized projects were placed. Among these were 1500 tons for Signal Hill, Cal., and 1467 tons for Clearwater, Cal., both booked by the American Cast Iron Pipe Co. No action has yet been taken on the inquiries put out by the Shell Oil Co. and the General Petroleum Corporation for oil storage tanks requiring over 9000 tons of plates.

Pig Iron.—Trading in foundry pig iron is limited to unimportant lots for prompt shipment. Prices are unchanged.

Prices per gross ton at San Francisco:

*Utah basic		\$25.00 to \$26.00
*Utah fdy., sil. 2.75 to 3.25		25.00 to 26.00
**Indian fdy., sil. 2.75 to 3.25		24.00 to 25.00

*Delivered San Francisco.

**Duty paid, f.o.b. cars San Francisco.

Bars.—While a number of projects involving lots of from 20 to 50 or 60 tons of reinforcing steel bars were placed this week, larger awards were limited to three jobs. The Pacific Coast Steel Co. took 200 tons for a plant for the Simmons Co., San Francisco, and an unnamed interest secured 390 tons for an apartment and 130 tons for a club building in Los Angeles. Bids were opened this week on 525 tons for the Bernal Cut project, San Francisco. About 600 tons is involved in buildings for the Government at Fort Lewis, Wash. Bids have been opened on 225 tons for a hotel at Santa Cruz, Cal. Low prices on out-of-stock material continue to prevail in the San Francisco and Los Angeles districts, and 1.80c., base, appears to be general.

Plates.—The Steel Tank & Pipe Co. of Oregon took the only large job involving plates. This called for 175 tons for a 54-in. welded pipe line at Tacoma, Wash. Action is expected during the next week or 10 days on the inquiries for 14 82,000 bbl. tanks for the General Petroleum Corporation, Los Angeles, calling for 5000 tons and on the inquiries of the Shell Oil Co. for 15 80,000 bbl. tanks, involving 4600 tons. Bids will be called

for next week on 1200 tons for a pipe line at Hood River, Ore. Plate prices continue to range from 2.20c. to 2.25c., c.i.f.

Shapes.—Only one structural shape award exceeding 100 tons was placed during the week. The Golden Gate Iron Works took 150 tons for an apartment in San Francisco. Bids will be opened next week on 243 tons for the Gardiner bridge over the Yellowstone River in Montana and bids have been called for by the Great Western Power Co., San Francisco, for the India Basin power plant involving close to 2000 tons of material. Plain material is firm at 2.35c., c.i.f.

Cast Iron Pipe.—Cast iron pipe awards this week were the heaviest since the last week of April and totaled 4096 tons. The American Cast Iron Pipe Co. took 1502 tons of 4 to

18-in. Class B pipe for Signal Hill, Cal., and 1467 tons of 4 to 10-in. Class B pipe for Clearwater, Cal. George Nelson & Co. were awarded 949 tons of 8 to 30-in. Class C pipe for the improvement of Denny Hill, Seattle. San Diego placed 178 tons of 4 to 10-in. Class B pipe for the improvement of Mount View Drive with V. R. Dennis Construction Co. Pending business is of light proportions, with only four projects pending. These involve 142 tons of 4 to 14-in. Class B pipe for Oxnard, Cal., bids on which will be opened Sept. 25; from 263 to 537 tons of 2 to 12-in. Class B pipe for Phoenix, Ariz.; 282 tons of 6 to 12-in. Class B and C pipe for Sixth Avenue, N. W., Seattle, and 22,000 tons for the East Bay Municipal Utility District in Oakland.

Standard Pipe.—Movement of oil country goods in the southern part of the State continues unabated, and some fair-sized lots of well casing have been booked. Demand for line pipe tonnage is light. Standard steel pipe is in better demand and distributors are beginning to replenish depleted stocks.

Canada

Structural Steel Leads in Activity in Dominion Markets—15,000 to 20,000 Tons in St. John, N. B., Projects

TORONTO, ONT., Sept. 25.—Pig iron sales for the week failed to reach the high average of the two or three weeks previous, but business continues at a satisfactory level. Upward of 60 per cent of melters have covered to the end of the year, and although additional contracts are continually being closed, the rush appears to be over. One forward contract for about 5000 tons of iron was booked last week, but most of the current demand is for spot delivery. A stiffening in prices has had a tendency to bring lagging buyers into the market.

Prices per gross ton:

Delivered Toronto	
No. 1 fdy., sil. 2.25 to 2.75	\$23.60
No. 2 fdy., sil. 1.75 to 2.25	23.60
Malleable	23.60

Delivered Montreal	
No. 1 fdy., sil. 2.25 to 2.75	25.00
No. 2 fdy., sil. 1.75 to 2.25	25.00
Malleable	25.00
Basic	24.00

Imported Iron, Montreal Warehouse	
Summerlee	33.50
Carron	33.00

Structural Steel.—Structural steel sales continue to hold a prominent place in the iron and steel markets of this country, and at the moment there is little prospect of a decided slump. Contracts awarded during the week include 2000 tons to the Dominion Bridge Co., Montreal, for a bridge over the ship canal at Welland, Ont., and 1000 tons of reinforcing bars to the Canadian Bridge Co., Walkerville, Ont., for a distillery plant at Amherstburg, Ont., for Border Brewers & Distillers, Ltd. In addition, about 5000 tons was placed in lots ranging from 100 to 400 tons. Prospects in-

clude 15,000 to 20,000 tons for a bridge and 12 warehouse buildings at St. John, N. B., for the St. John Harbor Commissioners; 1500 tons of structural steel and 300 tons of reinforcing bars for Pathological Building for University of Toronto, Toronto; 8000 tons of structural steel for office building in Montreal for H. M. Caiserman & Henry Rieder; 1000 tons reinforcing bars for office building at Bleury and Sherbrooke Streets, Montreal, for J. Lewinson, 5010 Sherbrooke Street West; 400 tons reinforcing bars for garage for C. T. A. Hart, St. Catharine and Chomedey Streets, Montreal.

Old Material.—Following the strong demand for old material during the past two or three weeks, business has fallen off, but is still holding at a fairly high level. The prospect of higher prices has resulted in considerable new business being placed both for spot and future delivery. Prices are strong but unchanged.

Dealers' buying prices:

	Per Gross Ton	
	Toronto	Montreal
Heavy melting steel	\$9.00	\$7.00
Rails, scrap	10.00	9.00
No. 1 wrought	9.00	11.00
Machine shop turnings	7.00	5.00
Boiler plate	7.00	6.00
Heavy axle turnings	7.50	6.50
Cast borings	7.50	5.00
Steel turnings	7.00	5.50
Wrought pipe	5.00	5.00
Steel axles	14.00	20.00
Axles, wrought iron	16.00	22.00
No. 1 machinery cast	16.00	16.00
Stove plate	13.00	13.00

Com. wire nails, base per keg	\$3.40
Cement c'd nails, 100-lb. keg	3.40

Buffalo

Higher Pig Iron Prices Established on Small Sales—Scrap Strong on Active Demand

BUFFALO, Sept. 25.—Pig iron business is being taken at the advanced prices quoted, but not in volume. Prices appear to be holding firm on the small lots being sold in the district and in New England. The only inquiry for a sizable lot is for 500 to 1000 tons of foundry from the Westinghouse Air Brake Co. This is reported to have been closed. First quarter business is being quoted at 50c. more per ton than last quarter business. Operations are unchanged.

Prices per gross ton, f.o.b. furnace:
No. 2 fdy., sil. 1.75 to 2.25 \$17.00 to \$18.00
No. 2X fdy., sil. 2.25 to 2.75 17.50 to 18.50
No. 1X fdy., sil. 2.75 to 3.25 18.50 to 19.50
Malleable, sil. up to 2.25 17.50 to 18.50
Basic 17.00 to 17.50
Lake Superior charcoal 27.28

Finished Iron and Steel.—Bar and shape prices are firm at 2.10c., Buffalo, with demand good. Some bar deliveries have been slowed up. Sheets are quite active, with black firm at 2.75c.; galvanized at 3.50c. to 3.60c., and automobile body at 4c. Bolt and nut prices are good, and the operation is better than average. Reports on Canadian steel business are very favorable, the best in years. The contract for fabricating the steel, about 1150 tons, for the Bliss & Laughlin plant in Buffalo has been awarded.

Old Material.—Prices of No. 1 heavy melting steel have stiffened to \$15.75 to \$16. The latter price is said to have been paid for part of several thousand tons. Dealers are said to be paying \$15 to \$15.50 for strictly No. 1 heavy melting steel. The largest consumer of scrap in this territory is expected to come in the mar-

ket very shortly. It is said that considerable lots of machine shop turnings, No. 2 steel and shoveling turnings are being shipped out of this district, attracted by better prices in Pittsburgh. More scrap is said to have been purchased here within the past month than during the previous six months.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades
No. 1 heavy melting steel \$15.75 to \$16.00
No. 2 heavy melting steel 13.00
Scrap rails 14.50 to 15.00
Hydraulic comp. sheets 13.00
Hand bundled sheets 11.00 to 11.50
Drop forge flashings 13.00 to 13.50
No. 1 busheling 14.25 to 14.75
Hvy. steel axle turnings 12.00 to 12.50
Machine shop turnings 7.00 to 7.50
No. 1 railroad wrought 13.00 to 13.50

Acid Open-Hearth Grades
Knuckles and couplers 16.50 to 17.00
Coil and leaf springs 16.50 to 17.00
Rolled steel wheels 16.50 to 17.00
Low phos. billet and bloom ends 17.00 to 17.50

Electric Furnace Grades
Hvy. steel axle turnings 12.00 to 12.50
Short shov. steel turnings 11.50 to 12.00

Blast Furnace Grades
Short shov. steel turnings 11.50 to 12.00
Short mixed borings and turnings 9.50 to 10.00
Cast iron borings 9.50 to 10.00
No. 2 busheling 10.50 to 11.00

Rolling Mill Grades
Steel car axles 18.00 to 18.50
Iron axles 21.00 to 22.00

Cupola Grades
No. 1 machinery cast 15.00 to 15.50
Stove plate 13.50 to 14.00
Locomotive grate bars 12.00 to 12.50
Steel rails, 3 ft. and under 17.00 to 17.50
Cast iron carwheels 13.00 to 13.50

Malleable Grades
Industrial 16.00 to 16.50
Railroad 16.00 to 16.50
Agricultural 16.00 to 16.50

Birmingham

Pig Iron Sales Increase Slightly—Steel Demand Steady and Is Keeping Southern Mills Well Scheduled

BIRMINGHAM, Sept. 25.—Pig iron sales during the week showed an increase over those of the previous week. The market is firmer. A few of the orders extend through the fourth quarter at the current price of \$16.25. Practically all October requirements have been covered and a good portion of the November iron is under contract. Shipments approximate the

make, with a little surplus iron being moved. A few instances of increased melt have been noted among the foundries and machine shops. Furnace operations remain unchanged; of the 18 furnaces in blast, nine are on foundry, seven on basic, one on recarburizing iron and one on ferromanganese.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil. \$16.25
No. 1 fdy., 2.25 to 2.75 sil. 16.75
Basic 16.25

Finished Steel.—Last week's sales and inquiries were up to the average of the past few weeks. Mill schedules are better filled than at any time in recent months. Structural shapes are active and the sheet market is strong. A good volume of finished steel has been shipped by barge down the Warrior River for distribution in

the Southwest, principally Texas. The Tennessee company is completing work on a new cotton tie mill at Fairfield. Structural steel business is improving a little. Reinforcing bar awards are in small lots, but the total volume is fairly satisfactory. For the past two weeks the Tennessee company has been operating six open-hearths at Ensley and six at Fairfield, while the Gulf States Steel Co. has been working four at Alabama City.

Cast Iron Pipe.—The only tonnage of importance to develop in several weeks is a project at Dallas, Tex., requiring about 16,000 tons, and a fair-sized project at Mobile, Ala., still pending. Aside from these, the market is quiet. Plant operations are being maintained by the usual run of small orders. Shipments are up to the average and are about equal to output. Makers are adhering to the quotations of \$34 to \$35 on 6-in. and larger sizes.

Coke.—Domestic coke is in active demand, but activity in foundry coke is limited, as all of the important consumers are covered through the year and most of them through the first quarter of next year. A few spot sales are being made. Shipments on contracts have increased a little in the last few days. Quotations are unchanged from the \$5 base for both spot and contract coke.

Old Material.—A steady volume of small-lot sales has followed the recent advances in prices. Consumer interest is greater than at any time in several months, and the market has a fairly firm tone.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel \$10.00 to \$11.00
Scrap steel rails 11.50 to 12.00
Short shoveling turnings 8.00 to 8.50
Cast iron borings 8.00
Stove plate 13.50
Steel axles 19.00 to 20.00
Iron axles 21.00 to 22.00
No. 1 railroad wrought 10.00 to 10.50
Rails for rolling 14.00
No. 1 cast 15.00
Tramcar wheels 13.00 to 14.00
Cast iron carwheels 13.00 to 13.50
Cast iron borings, chem. 13.50 to 14.00

Detroit Scrap Market

DETROIT, Sept. 25.—The market on old material continues strong in the district. Prices are the same as quoted a week ago.

Dealers' buying prices per gross ton f.o.b. cars, Detroit:

Hvy. melting and shov. steel \$12.00 to \$12.50
Borings and short turnings 8.00 to 8.50
Long turnings 7.00 to 7.50
No. 1 machinery cast 14.00 to 15.00
Automobile cast 19.00 to 20.50
Hydraul. comp. sheets 11.50 to 12.00
Stove plate 11.00 to 12.00
No. 1 busheling 9.50 to 10.00
Sheet clippings 7.50 to 8.00
Flashings 10.00 to 10.50

Total apparent consumption of babbitt metal in August was 4,755,662 lb., compared with 4,692,825 lb. in July and with 5,496,659 lb. in August, 1927, according to reports received by the Department of Commerce from 31 firms.

Warehouse Prices, f.o.b. Buffalo

Base per Lb.

Plates and struc. shapes 3.40c.
Soft steel bars 3.30c.
Reinforcing bars 2.75c.
Cold-fin. flats, sq. and hex. 4.45c.
Rounds 3.95c.
Cold rolled strip steel 5.85c.
Black sheets (No. 24) 4.20c.
Galv. sheets (No. 24) 4.70c. to 5.05c.
Blue ann'd sheets (No. 10) 3.70c.
Com. wire nails, base per keg \$3.65
Black wire, base per 100 lb. 3.90

Cincinnati

September Orders for Sheets Unusually Heavy—Pig Iron Trade Dull But Prices Are Firm

CINCINNATI, Sept. 25.—Pig iron sales dropped off sharply in the past week, and inquiries before the local trade are negligible. Sellers are of the opinion that most consumers have contracted for their requirements during the remainder of the year and that there will be little important buying in the next 30 days. The slackening of interest, however, has not affected prices, which remain firm. This strength is attributed to the fact that the furnaces supplying users in this district have well-filled order books and are not keen about soliciting further business at the moment. At least one northern Ohio seller is reported to have withdrawn from the market. Lake interests are said to be holding to a minimum of \$17.50, base furnace, while Alabama and Tennessee companies are adhering to \$16.25, base Birmingham. Jackson County silvery furnaces have on hand a liberal volume of specifications and orders. At Ironton, there is only a small tonnage of unsold iron in furnace yards.

Prices per gross ton, deliv'd Cincinnati:
So. Ohio fdy., sil. 1.75 to 2.25 \$18.89 to \$19.89
So. Ohio malleable 20.14 to 20.89
Ala. fdy., sil. 1.75 to 2.25 19.94
Ala. fdy., sil. 2.25 to 2.75 20.44
Tenn. fdy., sil. 1.75 to 2.25 19.94
So'th'n Ohio silvery 8 per cent 26.89

Freight rates, \$1.89 from Ironton and Jackson, Ohio; \$3.69 from Birmingham.

Warehouse Business.—Sales this month are closely paralleling those of August. Bars, structural shapes and plates are the leading products in volume of orders. Aside from continued irregularities in common wire nails at Louisville, prices are steady.

Finished Material.—Orders and specifications booked by district sheet makers in September are considerably in excess of output, which has been maintained at almost 100 per cent of capacity. Demand from various consuming lines has been well balanced, and indications are that the flow of business from diversified sources will continue in the immediate future.

Sales of electrical sheets have been of substantial volume, while shipments to automobile manufacturers have not slackened. The fourth quarter schedule of prices has become more firmly established, and no deviations are noted. Movement of wire products is better. Common wire nails are being shipped into Cincinnati at a delivered price under \$2.69 per keg, but an effort is being made to set up that figure as minimum for the remainder of the year. Activities in structural steel are showing signs of a recovery after a somewhat dull period so far as fresh bookings are concerned.

Coke.—The coke market continues to show strength. Demand from foundries using by-product coke has been well sustained, and the colder weather has begun to stimulate the sale of domestic grades. By-product foundry will remain at \$7 per net ton, f.o.b. ovens, during October. Domes-

tic schedules also will be unchanged, with egg size selling at \$4.50, ovens, and walnut at \$3.50.

Old Material.—Dealers' activities have continued to give the market an element of strength, although prices in the past week have remained virtually stationary. District steel plants are taking normal tonnages on current contracts. Railroads this month have been securing exceptionally good prices for their scrap, dealers in some cases having paid considerably more than present selling schedules warrant.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:
Heavy melting steel \$12.50 to \$13.00
Scrap rails for melting 13.00 to 13.50
Loose sheet clippings 9.25 to 9.75
Bundled sheets 10.00 to 10.50
Cast iron borings 8.50 to 9.00
Machine shop turnings 8.00 to 8.50
No. 1 busheling 10.50 to 11.00
No. 2 busheling 6.00 to 6.50
Rails for rolling 13.00 to 13.50
No. 1 locomotive tires 13.00 to 13.25
No. 2 railroad wrought 12.50 to 13.00
Short rails 17.00 to 17.50
Cast iron carwheels 12.00 to 12.50
No. 1 machinery cast 16.00 to 16.50
No. 1 railroad cast 13.00 to 13.50
Burnt cast 8.00 to 8.50
Stove plate 9.25 to 9.75
Brake shoes 10.25 to 10.75
Railroad malleable 12.25 to 12.75
Agricultural malleable 11.25 to 11.75

Detroit

Employment Records Broken—High Production Rate Continues at Leading Automobile Plants

DETROIT, Sept. 25.—Detroit's industrial employment has again broken all records, according to the labor barometer of the Detroit Employers' Association. The total, as of Sept. 18, is 300,759, an increase of 415 over the figure of Sept. 11. The corresponding figure of a year ago was 196,834.

A new line of commercial cars and trucks will soon be introduced by the Chrysler Corporation. These units will run in the half-ton and three-quarter-ton class, and are probably forerunners of a complete line of trucks which will include units of larger capacity.

The total August production of the Chrysler Corporation, including the newly acquired Dodge property, will run about 55,000 units. It is estimated that the total production for the Chrysler Corporation will reach a half million units during the year. It is reported that 40,000 employees are now at work in the Chrysler plants.

In August the General Motors Corporation shipped 186,653 units to its sales offices, whereas in August, 1927, it shipped 155,604 units. Deliveries to customers during the past month amounted to 187,463 against 158,619 a year ago. Total sales to dealers for the first eight months were 1,439,442. Sales to consumers in the same period were 1,427,924.

It is estimated that Olds Motor Works will in September nearly equal its August production of 7773 units, which was a record.

Additions to the plants of the Seaman Body Co. are expected to increase capacity to 1200 units a day. This becomes necessary to handle the recent order from the Nash Motors Co. New buildings and equipment will cost approximately \$2,000,000, and all plants will run at full capacity well into the winter.

Steel Fabricators to Meet in November

The sixth annual convention of the American Institute of Steel Construction, Inc., will be held at Biloxi, Miss., Nov. 13 to 17, inclusive. Problems of merchandising and of standardizing of products, says Charles F. Abbott, executive director of the association, will be the chief subjects for discussion.

Standardization already accomplished by the institute, Mr. Abbott adds, is saving the builders of the United States approximately \$30,000,000 per annum on current contracts.

The fall meeting of the American Refractories Institute will be held Oct. 24 at the William Penn Hotel, Pittsburgh. The meeting will be devoted to the discussion of specifications and will be a continuation of the specification symposium of the spring meeting at White Sulphur Springs, W. Va.

Non-Ferrous Metal Markets

Copper Again Advanced, Tin Active and Strong, Lead and Zinc Quiet and Steady

Copper.—Quotations have again been advanced $\frac{1}{4}$ c., electrolytic copper now selling for 15.25c., delivered in the Connecticut Valley, with the price of Copper Exporters, Inc., standing at 15.50c., c.i.f. European ports. Demand from consumers, both foreign and domestic, particularly the former, has been so heavy for another week that the advance was attributed to this as the main cause. As early as Saturday, Sept. 22, electrolytic copper sold at 15.25c., delivered in the Connecticut Valley, but the actual announcement of the advance was not made until Monday,

*Refinery quotation; delivered price $\frac{1}{4}$ c. higher.

Sept. 24. September will record a new record for total sales, exceeding the heavy demand in May. The total for the month to Sept. 22, inclusive, is estimated at over 200,000 tons, of which at least 70,000 tons was for export. Most domestic consumers are covered for October and November and sales at present are largely for December. Foreign consumers have taken about 60 per cent of their October requirements, 40 per cent for November and about 25 per cent for December. Some producers are out of the market for certain deliveries. Higher prices are predicted by some and not expected by others. Further heavy buying for foreign consumption might cause an increase, but yesterday and today, Tuesday, the market was much quieter. Lake copper is also higher at 15.25c. to 15.37 $\frac{1}{2}$ c., delivered, with sales made as far ahead as December.

Tin.—Sales for the week ended Saturday, Sept. 22, were about 1500 tons, bringing the total for the last five weeks close to 8000 tons. Friday, Sept. 21, was the most active day, with 800 tons changing hands. During the week consumers bought some, but the bulk was taken by dealers, with October-November delivery largely involved. Yesterday, Monday, was active with 400 tons taken by dealers. Today, Tuesday, the market was very quiet with spot Straits quoted at 48.62 $\frac{1}{2}$ c., New York. London prices were considerably higher than a week ago, with spot standard quoted at £223 10s., future standard at £219 and spot Straits at £226. The Singapore market was £221. Arrivals thus far this month are 8065 tons with 5420 tons reported afloat.

Lead.—A heavy business was done yesterday, Monday, and the market was quite active Tuesday, with quota-

Non-Ferrous Rolled Products

Mill prices on bronze, brass and copper products were advanced $\frac{1}{4}$ c. per lb. on Sept. 24, following a similar advance on Sept. 17. Zinc sheets have been quoted at 9.75c., base, since July 30, and lead full sheets at 10c. to 10.25c. since May 29.

tions steady and unchanged at 6.32½c., St. Louis, for September and October, and 6.35c., for November. The quotation of the leading interest is unchanged at 6.50c., New York, as the contract price.

Zinc.—Due to a large curtailment last week in ore production in the Joplin district, the tone of the market is considerably stronger. Production of ore for the week ended Saturday, Sept. 22, was estimated at 4500 tons, as against 11,800 tons the week before. Shipments were over 8200 tons, so that stocks of ore were reduced, with the estimated total now standing at about 47,100 tons. Some business in prime Western zinc is reported each day, but the market is not particularly active. Prices are evidently stabilized at 6.25c., East St. Louis, or 6.60c., New York. Ore prices are unchanged at \$40, Joplin.

Antimony.—Because of very small August-September shipments from China and also because of heavy buying by dealers, Chinese metal is higher at 11c. to 11.25c., New York,

duty paid, for spot and 10.75c. and up for futures. There is a stronger attitude among sellers.

Nickel.—Ingot nickel in wholesale lots is quoted at 35c. with shot nickel at 36c. and electrolytic nickel at 37c. per lb.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is quoted at 23.90c. per lb., delivered.

Non-Ferrous Metals at Chicago

CHICAGO, Sept. 25.—Sales are moderately active in a market in which prices for tin and lead are higher. Prices for old metals are steady.

Prices, per lb., in carload lots: Lake copper, 15.25c.; tin, 49.50c.; lead, 6.45c.; zinc, 6.35c. in less-than-carload lots; antimony, 12c. On old metals we quote copper wire, crucible shapes and copper clips, 10.75c.; copper bottoms, 9.75c.; red brass, 9.50c.; yellow brass, 7.25c.; lead pipe, 4.75c.; zinc, 3.50c.; pewter, No. 1, 30c.; tin foil, 36.25c.; block tin, 45.25c.; aluminum, 12c., all being dealers' prices for less-than-carload lots.

Fabricated Structural Steel

Awards of 30,000 Tons—New Projects at 10,300 Tons Are Lowest in Several Months

AWARDS reported during the week amounted to 30,000 tons, the largest having been a railroad bridge at Toledo, Ohio, calling for 4500 tons. The total of new projects was only 10,300 tons, one of the lowest figures of the year. Awards follow:

BOSTON, 200 tons, bridge across River Street, to Boston Bridge Works, Inc.

BOSTON, 162 tons, stores and offices on Washington Street, to New England Structural Co.

BOSTON, 125 tons, office building on Newbury Street, to A. L. Smith Iron Works, Inc.

STATE OF VERMONT, 150 tons, highway bridge, to American Bridge Co.

BRISTOL, CONN., 300 tons, factory building for New Departure Mfg. Co., to Berlin Construction Co., Inc.

NEW YORK, 2200 tons, Doctors' Hospital at Eighty-seventh Street and East End Avenue, to Hedden Iron Construction Co.

NEW YORK, 2100 tons, apartment building at 1001 Park Avenue, to Hedden Iron Construction Co.

NEW YORK, 1800 tons, store building at 721 Fifth Avenue, to A. E. Norton, Inc.

NEW YORK, 700 tons, widening of Park Avenue between Fifty-seventh and Seventy-second Streets, to Phoenix Bridge Co.

ITHACA, N. Y., 650 tons, Plant Industries Building for Cornell University, to Kellogg Structural Steel Co.

STANDARD OIL CO. OF NEW JERSEY, 1000 tons, several tanks in Texas, to unnamed local fabricators.

CARNEYS POINT, N. J., 125 tons, for Du Pont Engineering Co., to American Bridge Co.

BELLE, W. VA., 130 tons, power station for Du Pont Engineering Co., to Virginia Bridge & Iron Co.

MORGANTOWN, W. VA., 575 tons, South Park bridge, to McClintic-Marshall Co.

WASHINGTON, 700 tons, building for

Daughters of American Revolution, to Barber & Ross.

WASHINGTON, 270 tons, Main Street bridge, to unnamed fabricator.

MONTGOMERY, ALA., 150 tons, high school, to Ingalls Iron Works Co.

HARRISBURG, PA., 350 tons, 23 State Highway Department machinery storage buildings, to Blaw-Knox Co.

PITTSBURGH, 3200 tons, 20 coal barges for Crucible Fuel Co.; 12 barges, 1920 tons, to American Bridge Co.; 8 barges, 1280 tons, to Jones & Laughlin Steel Corporation.

FORD CITY, PA., 450 tons, extensions for Pittsburgh Plate Glass Co., to McClintic-Marshall Co.

BUFFALO, 1150 tons, Bliss & Laughlin plant, to Lackawanna Steel Construction Co.

BUFFALO, 200 tons, addition for Houde Engineering Co., to R. S. McMannus Steel Construction Co.

LANSING, MICH., 120 tons, viaduct; from Jarvis Engineering Co., general contractor, to Massillon Bridge & Structural Co.

LOCKLAND, OHIO, 1000 tons, building for Tennessee Copper & Chemical Co., to unnamed fabricator.

TOLEDO, OHIO, 4500 tons, Maumee River Bridge for Toledo Terminal Railroad Co., to American Bridge Co.

CINCINNATI, 175 tons, building for Cincinnati Sheet Metal Roofing Co., to Southern Ohio Iron Works.

SOUTH BEND, IND., 900 tons, machine shop, to Indiana Bridge Co.

NEW YORK CENTRAL RAILROAD, 150 tons, bridge at Kankakee, Ill., to Mount Vernon Bridge Co.

STATE OF ILLINOIS, 750 tons, armory for

124th Illinois Artillery, to Mississippi Valley Structural Steel Co.

CHICAGO, 170 tons, addition to building at 123 West Madison Street, to Wend-nagel & Co., local.

CHICAGO, 230 tons, warehouse for Central Steel & Wire Co., to Reuter Brothers, local.

CHICAGO, 1040 tons, building for University of Chicago, to Lakeside Bridge & Steel Co.

CHICAGO, 1760 tons, two junior high schools, to unnamed bidder.

MONSANTO, ILL., 450 tons, chemical plant, to American Bridge Co.

MILWAUKEE, 250 tons, building No. 33 for International Harvester Co., to Lakeside Bridge & Steel Co.

ST. PAUL, MINN., 500 tons, addition to Selms-Stemle plant, to Minneapolis Steel & Machinery Co.

EAST ST. LOUIS, ILL., 400 tons, electrolytic zinc plant for Evans-Wallower Zinc Co., to American Bridge Co.

SCHALL, ARK., 900 tons, building for Arkansas Portland Cement Co., to Kansas City Structural Steel Co.

SAN FRANCISCO, 150 tons, apartment building at Laguna and Waller Streets, to Golden Gate Iron Works.

TACOMA, WASH., 175 tons plates, 54-in. welded pipe line, to Steel Tank & Pipe Co.

TULSA, OKLA., 500 tons, Bliss Hotel, to Patterson Steel Co.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

STATE OF MAINE, 300 tons, highway bridge.

NEW YORK, 500 tons, apartment building at Second Avenue and Twenty-first Street; Schroeder & Koppel, Inc., general contractor.

STATE OF NEW YORK, 700 tons, highway bridges.

HARRISBURG, PA., 400 tons, Zembo Temple. WASHINGTON, 2500 tons, Government Printing Office.

WASHINGTON, 500 tons, work on Arlington Memorial Bridge.

PHILADELPHIA, 550 tons, Circle Theater, Day & Zimmermann, general contractor.

CLEVELAND, 150 tons, factory building for Gears & Forgings, Inc.

CLEVELAND, 500 tons, plant extensions for Eaton Axle & Spring Co.

JOLIET, ILL., 1750 tons, bridge across Des Plaines River for Rock Island Railroad.

CHICAGO, 1550 tons, armory, Mississippi Valley Structural Steel Co., low bidder.

HASTINGS, NEB., 900 tons, dam.

Proposes Research on Strength of Jacketed Vessels

The Boiler Code Committee of the American Society of Mechanical Engineers has recommended to the society's main research committee that an investigation be made into the collapsing strength of jacketed vessels, digesters, enamelled tanks, vacuum stills, and similar vessels. There seems to be no general agreement among engineers on the proper formulas to be used for such designs.

It is realized that extensive experimental work may be required but the main research committee believes that industry will be willing to support an investigation if it has a real need for the information. Accordingly that committee is now circularizing manufacturers and users interested.

PERSONAL

ALONZO F. ALLEN has been appointed secretary and treasurer of the American Steel & Wire Co., Cleveland. He has been secretary and assistant treasurer of the company. His appointment follows the retirement on pension of J. R. THOMAS, treasurer, and the resignation of R.

A. F. ALLEN

R. HAMPSON, assistant treasurer in the company's New York office. Mr. Allen's promotion follows a decision of the company to combine the offices of secretary and treasurer. J. G. NELSON, who has been assistant secretary at Cleveland, has been made assistant secretary and treasurer there; R. S. WHITE has been made assistant secretary and assistant treasurer in New York and C. S. CAWTHORNE has been named to the same positions in Chicago. Mr. Thomas had been connected with the company and its predecessor 43 years. His first position was in the Salem, Ohio, plant, which was operated by the Salem Wire Nail Co. and later taken over by the American Steel & Wire Co.

Officers elected by the Metals Coating Co. of America, 495 North Third Street, Philadelphia, at a recent directors' meeting were RICHARD L. BINDER, president; GEORGE RUCK and RUDOLPH H. SCHROEDER, vice-presidents; E. WARING WILSON, treasurer, and JOSEPH C. MERKEL, secretary.

JOSEPH J. BEEMAN has been appointed district engineer and sales representative in Michigan for the Despatch Oven Co., Minneapolis, with headquarters at 4037 Blaine Avenue, Detroit, and will be in charge of sales of the company's small industrial ovens and its large continuous conveyor ovens. J. G. PARKER has been named to serve the company in a similar capacity in western New York, and will have headquarters at 333 Jackson Building, Buffalo.

J. W. SPENCER, JR., for a number of years identified with the New York office of the Ross Heater & Mfg. Co., Inc., Buffalo, has been placed in charge of a new branch office which the company has opened at 121 North Broad Street, Philadelphia.

H. D. ROSENKRANS has been appointed district manager of a new office which has been opened at 50 Church Street, New York, by the Niagara Machine & Tool Works, Buffalo, to serve the metropolitan New York territory. He has been associated with the company for nine years and has served in the engineering, advertising and sales departments. The company manufactures machines and tools for sheet metal working.

E. J. PHILLIPS, who has been identified with the Detroit sales organization of the Van Dorn Electric Tool Co., Cleveland, has been transferred to San Francisco and will be succeeded in the Michigan territory by his brother, GEORGE PHILLIPS. J. F. SPAULDING has been placed in the Van Dorn Baltimore office to succeed JACK BEGGS, who has been removed to the company headquarters at Cleveland.

HAL F. WRIGHT has been appointed assistant to the general manager of sales for the American Chain Co., Inc., and associated companies, Bridgeport, Conn.

Dr. C. L. MANTELL, consulting chemical engineer, has returned to the department of chemical engineering at Pratt Institute, Brooklyn, for the school year, after having served as assistant editor of *Chemical and Metallurgical Engineering* during the summer months.

J. E. SULLIVAN, former superintendent of last furnaces and ore docks at the Sparrows Point plant, Bethlehem Steel Co., has been made vice-president of Edgar E. Brosius, Inc., engineer, Pittsburgh.

HARRY SAXER, who has been superintendent of blast furnaces at the Aliquippa works, Jones & Laughlin Steel Corporation, has been promoted to assistant general superintendent of that works, succeeding GRENVILLE LEWIS, resigned. Mr. Saxer has been succeeded by R. A. FIELD, who has been assistant superintendent of blast furnaces at Aliquippa. Mr. Saxer has been identified with the company for 20 years, for five years at the Eliza furnaces, Pittsburgh, and for the remainder at the Aliquippa furnaces, first as assistant superintendent and then as superintendent. In the latter position he was largely responsible for the changes in the lines of the Aliquippa furnaces which added mate-

rially to their capacities and in the case of No. 5 furnace to its setting several new high production records. In March this year that furnace produced 30,287 gross tons of pig iron, a daily average of 977 tons, and lately it has been averaging more than 1000 tons daily. He is a charter member of the Eastern States Blast Furnace and Coke Oven Association and has taken an active part in its affairs.

CLYDE H. TENEYCK, for a number of years in the operating department of the Illinois Steel Co., Chicago, has resigned to become associated in an executive capacity with Bliss & Laughlin, Inc., Harvey, Ill., manufacturer of cold-rolled steel bars and shafting. Mr. TenEyck has been identified with the steel industry for 20 years.

FRANK B. PARKER, general manager of Briggs & Turivas, Inc., dealer in scrap iron and steel and iron and steel products, Blue Island, Ill., has been made vice-president and general manager of the company.

H. E. STOCKER has joined the Chicago sales organization of the Hendey Machine Co., Torrington, Conn.

B. E. KIBBEE, vice-president in charge of sales for the Sharon Steel Hoop Co., Sharon, Pa., has been elected a director of the company.

WILLIAM M. CORSE, consulting metallurgical engineer, Washington, spoke on "Development of Business Through Research," at the annual sales convention of the Hanson-Van Winkle-Munning Co., Matawan, N. J., manufacturer of electroplating and polishing equipment and supplies, which was held Sept. 11 to 15 at Asbury Park, N. J. FREDERICK G. SPACE, purchasing agent Seymour Mfg. Co., Seymour, Conn., spoke on "Sales Ethics," and L. C. MORROW, managing editor *American Machinist*, New York, on "The Increasing Interest in Metal Finishing." In the closing address VAN WINKLE TODD, president of the New Jersey company, predicted a continuance of prosperity in the plating industry.

J. C. WILLIAMS, vice-president and general manager Weirton Steel Co., Weirton, W. Va., has returned from a two months' European tour.

C. EDWIN CLARK, who has been superintendent of the mechanical department at the Lackawanna, N. Y., plant, Bethlehem Steel Co., has been made assistant general manager of the company's Sparrows Point, Md., plant.

WALTER BLOCK and A. D. FIELDS, formerly with the consulting engineering firm of Clark, MacMullen & Riley, Inc., New York, have opened offices as consulting engineers at 17 East Forty-fifth Street, New York, and will specialize in industrial plant design and equipment.

OBITUARY

PAUL ARMSTRONG, president and one of the founders of the Armstrong Brothers Tool Co. and Armstrong-Blum Mfg. Co., Chicago, died at his home at River Forest, Ill., on Sept. 20, in his sixty-sixth year. He had

PAUL ARMSTRONG

been in failing health for several months. He was born at Perth, Scotland, and came to this country at the age of three, when his parents made Chicago their home. In 1893 with his brothers, John, Hugh and James, he founded the Armstrong Brothers Tool Co. for the manufacture of machinists' tools. It has been said that Paul Armstrong was more largely responsible than any other man for the universal adoption of the tool holder system in the use of machine tools.

HENRY C. BANDAUI, one of the founders and for several years president of the Kohver Pattern Co., Milwaukee, died Sept. 16, following a paralytic stroke. He was 51 years of age and had lived in Milwaukee since 1903.

WILLIAM J. BRYSON, retired civil engineer and a member of the board of directors of James B. Clow & Sons, Chicago, died Sept. 16 at Lake Placid, N. Y. His first employment was with the United States Government in 1865 as an engineer on fortifications near Washington. For a number of years until 1900 he was assistant engineer for the Chicago & Alton Railroad.

HENRY S. LYONS, president of the Mystic Steamship Co. and vice-president of the Massachusetts Gas Companies, Boston, died of pneumonia in New York on Sept. 21.

WALTER C. ARTHURS, since 1903 president Mount Vernon Car Mfg. Co., Mount Vernon, Ill., died suddenly while nearing that city on his return with his family from a summer vacation at Hackensack, Minn. He

was born at Hillsboro, Ill., 63 years ago, but had lived in Mount Vernon ever since the car company was established in 1890.

DAVID AHLIN, since 1924 engineer in charge of acetylene installations for the Keith Dunham Co., Chicago, and one of the outstanding figures in the acetylene industry in the United States, died suddenly on Sept. 6. He was born at Stockholm, Sweden, in 1880, and was graduated from the Swedish Naval Academy. He first began to devote his attention to the use of acetylene when employed by the De Laval company and the Swedish Gas Accumulator Co. in Sweden, and while associated with the latter company, he made his first trip to the United States in 1910. In this coun-

Reinforcing Steel

Iowa Road Work Calls for 9000 Tons

HIGHWAY work in Iowa, calling for 9000 tons, brought the total of new projects reported during the week to 12,000 tons. The following awards, totaling 5400 tons, included no jobs of outstanding size:

BOSTON, 175 tons, Boston & Maine Railroad baggage terminal, to Concrete Steel Co.

NEW YORK, 400 tons, subway section 2, route 106; from La Rocca Construction Co., general contractor, to Fireproof Products Co.

BROOKLYN, 550 tons, building for Brooklyn Ash Removal Co., Inc., to McClintic-Marshall Co.

BROOKLYN, 300 tons, foundation work for Abraham & Strauss department store building, to Concrete Steel Co.

JAMAICA, N. Y., 110 tons, Suffolk Title & Guaranty building, to Carroll-McCreary Co., Inc.

NEWARK, N. J., 200 tons, substation for Public Service Production Co., to Joseph T. Ryerson & Son, Inc.

NEWARK, 120 tons, Essex County Vocational School, to Tidewater Structural Materials Corporation.

STATE OF NEW JERSEY, 150 tons, road work, to Concrete Steel Co.

STATE OF NEW JERSEY, 200 tons, road work near Riverton; from Cizzienti Brothers, general contractors, to Taylor-Davis Co., Philadelphia.

NEW BRUNSWICK, N. J., 150 tons, distributing station for Public Service Production Co., to Igoe Brothers.

CLEVELAND, 600 tons, Nickel Plate Railroad grade crossing elimination work, to Pattison Leitch Co.

CHICAGO, 260 tons of rail steel bars, apartment building on Winthrop Avenue, to Calumet Steel Co.

CHICAGO, 100 tons of rail steel bars, Rockeby Apartments, to Concrete Engineering Co.

CHICAGO, 200 tons, addition to Victory Mfg. Co. plant, to unnamed bidder.

CHICAGO, 100 tons, building for Peoples' Furniture Co., to Concrete Engineering Co.

CHICAGO, 120 tons, apartment building on

try he became identified with the American Gas Accumulator Co. and in 1911 was made chief engineer of the Commercial Acetylene Supply Co., New York, holding that position until 1924.

JOSEPH R. DILWORTH, president Dilworth, Porter & Co., Pittsburgh, manufacturers of railroad supplies, died at his summer home at Southampton, N. Y., on Sept. 21, aged 68 years. He was born in Pittsburgh, but had lived in New York for a number of years.

FRED M. JOHNSON, general manager Brammer Washing Machine Co., Davenport, Iowa, died on Sept. 14.

FRED W. SYKES, for 27 years in charge of the Lake Street, Chicago, warehouse of the American Steel & Wire Co., died Sept. 21 following an attack of acute indigestion. He would have been 60 years old next April. Before taking charge of the warehouse he was employed by the Illinois Steel Co.

Oakdale Avenue, to Concrete Engineering Co.

CHICAGO, 165 tons, garage, to Barton Spiderweb System, Inc.

MOBILE, ILL., 500 tons of rail steel bars, building for Deere & Co., to Republic Iron & Steel Co.

NORTH PLATTE, NEB., tonnage unstated, building for Swift & Co., to Concrete Engineering Co.

EAST ST. LOUIS, ILL., 100 tons, electrolytic zinc plant for Evans-Wallower Zinc Co., to Laclede Steel Co.

ST. LOUIS, 325 tons, hotel and office building at Twelfth Boulevard and Olive Street, to Missouri Rolling Mill Corporation.

SAN FRANCISCO, 200 tons, Simmons Bed Co. plant, to Pacific Coast Steel Co.

LOS ANGELES, 130 tons, club building, South Los Angeles Street, to unnamed company.

LOS ANGELES, 390 tons, apartment building, Ocean View Avenue, to unnamed company.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

NEW YORK, 500 tons, foundation work on Kill Van Kull Bridge; Converse Construction Co., general contractor.

NEW YORK, 185 tons, addition to Evander Childs High School; bids opened Sept. 25.

BROOKLYN, 400 tons, building for Brooklyn Ash Removal Co., Inc.

CHICAGO, tonnage not stated, two junior high schools; Thorgerson & Erickson, low bidder on general contracts.

CHICAGO, 200 tons, building for Commonwealth Edison Co.; MacDowell Construction Co., low bidder.

CHICAGO, 370 tons, armory; Great Lakes Construction Co., low bidder.

STATE OF IOWA, 9000 tons, highway work. OAKLAND, CAL., 140 tons, office building, Fourteenth and Franklin Streets; bids being taken.

SAN FRANCISCO, 170 tons, apartment building, 2160 Pacific Street; bids being taken.

SAN FRANCISCO, 190 tons, apartment building, Chestnut and Larkin Streets; bids being taken.

SAN FRANCISCO, 525 tons, Bernal Cut project; bids opened.

SANTA CRUZ, CAL., 225 tons, hotel; bids opened.

Tin Plate Plan Divides Foreign Fields

Welsh-American Agreement Sets Quotas for Canada, South America
and Italy—British Advance Export Ferromanganese Price

(By Cable)

LONDON, ENGLAND, Sept. 24.

THE Welsh-United States tin plate agreement, ratified last week, is now understood to concern only sales to Canada, South America and Italy, parts of which markets are to be reserved for United States mills, all other markets to be free. The United States must not exceed a 30 per cent quota for exports.

Cleveland pig iron is still quiet, but the outlook is regarded more favorable. Domestic purchasing is for delivery up to one month only, because of the uncertainty about the new railroad rates effective in December. Export inquiry is increasing.

Bolckow, Vaughan & Co. have blown out one furnace producing foundry grade and blown in a furnace on ferromanganese. Hematite iron is improving with quotations steadier as stocks have diminished.

Ferromanganese prices have been advanced for export as a result of improved Continental demand. Canada has bought 1500 tons of spiegel-eisen, which was shipped from Tees last week. Foreign ore is quiet and Bilbao Rubio prices are unchanged.

Domestic demand for finished steel is moderately active except in ship-building material. Export demand is increasing slowly with India especially interested in buying.

Galvanized sheets are active and demand for black sheets is better, particularly in light gages for Japan, on which mills are fully sold for some time.

Continental markets are strong with a sustained demand from overseas and British users are buying sparingly because of the advancing tendency of the market. The International Steel Cartel meets again Dec. 13. The International Tube Cartel met at Vienna, Sept. 21 and 22.

German pig iron output in August was 1,031,000 metric tons. Luxembourg production in July was 233,500 tons of pig iron and 224,000 metric tons of steel. Polish output in July was 56,000 tons of pig iron and 122,000 tons of steel.

Tin plate is moderately active, with makers enthusiastic about the future. Tin plate bar makers are engaged on heavy bookings and considering an advance in prices.

with 201,518 tons in June. Production of 757,000 metric tons in July was about 40,000 tons less than in the previous month. Prices continue strong, with the domestic market still advancing. At present there is discussion of the possibility of establishing a publicity office to promote new uses of steel in France. There is also a movement for the establishment of an export bureau for the mechanical trades, which would act as an information center in promoting exports of French iron and steel.

Pig Iron.—Demand is satisfactory, and at the next meeting of producers and consumers of phosphoric foundry iron it is expected that a large tonnage will be set aside in October for domestic users, with prices unchanged. The entente of French, Belgian and Luxembourg producers of pig iron has advanced the price of phosphoric foundry iron for Belgian consumers by 5 fr. (20c.) per metric ton, bringing it to 595 Belgian francs (\$23.20), f.o.b. Athus or Sterpeniche. Very little competition from Dutch hematite iron is reported in the North, except for a few shipments entered under the "temporary admission" agreement. Exports of pig iron were 51,797 tons in July and imports 2857 tons, compared with 39,876 tons of exports and 7555 of imports in June.

Semi-Finished Material.—Export prices are firmer, with blooms at £4 15s. to £4 16s. (\$23.09 to \$23.33) per metric ton, f.o.b. Antwerp, billets at £4 17s. 6d. to £4 18s. 6d. (\$23.69 to \$24.06), f.o.b. Antwerp.

Finished Material.—Merchant prod-

French Exports Decrease

Domestic Demand Heavy and Mills Are Well Filled—Export Information Bureau Advocated

PARIS, FRANCE, Sept. 11.—Increased domestic requirements for iron and steel are reflected in the smaller ex-

port total for July, which showed only 153,116 tons of iron and steel products shipped out of the country compared

British and Continental European prices per gross ton, except where otherwise stated, f.o.b. maker works, with American equivalent figured at \$4.86 per £ as follows:

Durham coke, del'd.....	£0 17½s.		\$4.25

(a) Nominal.

ucts continue to advance, and most mills are unable to offer shipment in less than three months. On certain sizes of shapes deliveries are four to five months. Steel bars are quoted on the Brussels Bourse at £6 2s. to £6 2s. 6d. per ton (1.35c. to 1.36c. per lb.), f.o.b. Antwerp, and normal specifications of beams range from £4 18s. to £4 18s. 6d. per ton (1.08c. to 1.09c. per lb.), with British specifications at £4 19s. to £4 19s. 6d. (1.09c. to 1.10c. per lb.) per ton, Antwerp. Export prices on sheets are firm at £6 9s. per ton (1.42c. per lb.) for 6 mm., and at £6 12s. per ton (1.46c. per lb.), Antwerp, for 3 mm. In the domestic market sheets are strong in

the lighter gages. Mills are quoting five to six weeks' delivery on plates and medium-gage sheets, and there is a substantial volume of inquiry. Deliveries on the lighter gages extend to two months or more, with prices tending to advance. Total exports of sheets in July were 14,286 tons, compared with 17,820 tons in June, while imports were 445 tons in July and 440 tons in June.

Rails.—The next meeting of the European Rail Makers Association is scheduled to be held in Paris, Sept. 21. French exports of rails in July totaled 42,416 tons, of which 12,656 tons went to Germany. Only 32,193 tons of rails were exported in June.

the privately owned companies. Imports included a wide range of rail sections, but 40 per cent of the total was in 100-lb. and heavier rails. Of the total steel produced in Japan and imported during 1927, importations represented about 36 per cent. Only in pipe, wire rods and I-beams did the imports exceed the domestic output. In the case of round steel bars imports represented only about 14 per cent of the total sold in the country, while in sheets imports were about 40 per cent of the total.

Prices of Imported Steel High

Recent quotations on Continental steel obtained by importers in New York have been close to 2c. per lb., duty paid, Atlantic port, on Thomas grade steel bars and 1.83c. to 1.88c. per lb., duty paid, on structural material. At these prices it is practically impossible to do business with American consumers. But foreign steel is still being sold, as occasionally importers find a mill in France, Belgium or Germany willing to accept certain sizes to complete a rolling, at slightly less than the usual quotations.

Japanese Steel Output Greater

More Than Half of Domestic Needs Furnished in Most Products—Tin Plate Order Goes to American Mills

NEW YORK, Sept. 25.—Export trade with the Far East is beginning to improve, but purchases from both China and Japan are limited to small lots, except in the case of large companies covering their usual requirements. One such purchase, 60,000 base boxes of tin plate, 14 x 18¾-in. and 10 x 20-in., was made last week by the Nippon Oil Co. from two large Japanese trading companies. The order is understood to have been distributed equally among five American mills. No inquiry for light-gage black sheets is reported here, but this is not considered unusual, as the leading Japanese maker, the Kawasaki Dockyard Co., Kobe, is reported to have a considerable supply of sheets in stock.

Latest Japanese reports on production and importation of steel products indicate that in most cases Japan is producing a large part of the country's requirements. The total production of steel in Japan by the Government Works and privately owned mills during 1927 was 1,277,826 metric tons. Adding 731,109 metric tons of imported steel, the total estimated consumption in Japan was, 2,008,935 metric tons. The following table gives the output, in metric tons, of the Government Works and private interests, and the imports for 1927:

	Production		Imports	Total
	Government Works	Private Plants		
Sheets	161,928	163,582	224,955	555,465
Tin plate....	14,706		61,052	75,758
Rails	165,950	4,139	88,854	258,943
Bars:				
Round ..	102,275	237,686	57,230	397,191
Square ..	19,860	9,435	6,983	36,278
Flat	37,584	29,979	19,152	86,715

Angles (unequal) ..	28,399	4,893	11,966	44,958
Channels ..	32,772		26,096	58,868
I-beams ...	15,491		36,495	51,986
Wire rods... 49,032	5,395	109,090	163,517	
Pipe	47,777	52,003	99,780	
Carwheels ..	7,638	11,215	796	19,649
Total, all products	698,363	579,463	731,109	2,008,935

Rail production, as shown in the table, covers 12 to 100-lb. sections in the case of the Government Works and mostly sections less than 20 lb. by

Krupp Works Building Steel Mills for Japan

HAMBURG, GERMANY, Sept. 11.—According to a recent report, Friedrich Krupp A. G., through its Grusonwerk at Magdeburg, has received an order from the Kawasaki Dockyard Co., Kobe, Japan, for rolling mill equipment to produce sheets of No. 22 gage and lighter. The Krupp works will ship a rail mill of 35,000 tons annual capacity to the Government Steel Works at Yawata, Japan, some time next month.

Formation of Sheet Cartel Considered in Germany

HAMBURG, GERMANY, Sept. 10.—Negotiations have been resumed among steel sheet producers for the formation of a sheet syndicate, and the two principal producers, Otto Wolff & Co., Cologne, and Wolff, Netter & Jacobi, Hausach, South Germany, are understood to have reached an agreement.

The sheet industry is apparently facing the need of some control such as might be exercised by a syndicate, as at present No. 20 gage sheets are selling at lower prices than plates. Sheets of this gage are quoted to domestic consumers at about 158 m. (\$37.64) per ton, whereas the lowest quotation on plates is 160 m. (\$38.71) per ton.

Another unusual condition in the sheet market is the level of export prices, which are higher than domestic instead of being 15 to 25 per cent lower as in the case of other products. For export, No. 25 gage sheets are quoted at £10 17s. 6d. to £11

(\$52.85 to \$53.46) per ton, f.o.b. port, whereas prices to domestic consumers range from 195 to 198 m. (\$46.45 to \$47.16) per metric ton.

German Machine Builders Open Paris Office

PARIS, FRANCE, Sept. 11.—The Syndicate of German Machine Tool Manufacturers has decided to establish an office in Paris to handle the large orders being placed with them on reparations account. Negotiations are reported to have been opened with several large French automobile manufacturers, which may result in contracts for German machine tools amounting to several million francs, with credit terms of three to 10 years.

It is reported by the French General Post Office that a bill is to be introduced in the Chamber of Deputies calling for the construction of 200 steel railroad mail cars, 20 meters long, all to be delivered before the end of 1929. Of the total purchase, 100 will be placed with French builders and the remainder with Germany on reparations account.

"Production of High Alumina Slags in the Blast Furnace" is the title of Technical Paper No. 425 of the United States Bureau of Mines by T. L. Joseph, S. P. Kinney and C. E. Wood. The 32-page pamphlet gives the results of 10 years of investigations conducted under a cooperative agreement between the Aluminum Co. of America and the University of Minnesota School of Mines' Experiment Station.

Machinery Markets and News of the Works

Machinery Industry Active

Plants Operating at High Rate on Unfilled Orders
and Outlook Continues Very Satisfactory

MACHINE tool trade developments continue highly favorable. Reports vary as to whether September volume will equal that of August. Some sellers have enjoyed an increased business, while others have had less. But taking into account the high rate at which many machine tool plants are operating, the large amount of unfilled business and the steady volume of orders and inquiries, a slight fluctuation downward this month need not be seriously regarded.

Some plants are not only working the full daylight schedule, but are doing some night work. The orders on hand, plus the present volume of new business, are sufficient to maintain this rate during the remainder of the year. Nothing short of a decided slump in orders next month can prevent a very satisfactory fourth quarter. And no such falling off in buying is yet in sight.

A substantial volume of recent business in the Central States has come

from the automotive industry, the widespread buying in that field being attributed to changes in models and the imperative need of reducing manufacturing costs to meet competition. Other sources of new business are the oil companies in the Southwest and the aviation industry.

The Eaton Axle & Spring Co., Cleveland, is in the market for special milling and grinding machinery and miscellaneous shop equipment for a large plant extension. It is reported in Chicago that the Ford company is planning to resume the manufacture of tractors at Fordson, Mich., and may buy equipment. The Allis-Chalmers Mfg. Co. is negotiating for equipment for its West Allis, Wis., plant. It has recently completed purchases for its tractor plant at Springfield, Ill.

Among the principal buyers in the East are the General Electric Co., Schenectady; North East Electric Co., Rochester, and Pratt & Whitney Aircraft Co., Hartford.

boring mills, one 2500-lb. steam hammer, two heavy-duty axle lathes, a Racine saw and a Cincinnati high-speed tapping machine. Pratt & Whitney division sold three vertical shapers, a deep-hole drilling machine, seven 1 x 18-in. automatic lathes, production hand milling machine, rotary surface grinder and 16 x 60-in. lathe.

Contract has been let by General Cable Co., 420 Lexington Avenue, New York, to Doullut & Erwin, Inc., Meaher Building, Mobile, Ala., for one-story wire and cable mill, 120 x 540 ft., at Mobile, to cost more than \$500,000 with equipment.

A. J. Schwarzler, 367 East 167th Street, New York, has had plans drawn for a three-story ice-manufacturing plant, to cost about \$150,000 with equipment. Project will include an automobile service, repair and garage building. Charles Schaefer, 332 East 149th Street, is architect.

American Seal Kap Corporation, Natick, Mass., manufacturer of metal bottle caps, etc., has purchased two factory buildings, 90 x 240 ft., in Long Island City, here-

tofore occupied by Type Founders Corporation, and will remove to new location.

New York Edison Co., Irving Place and Fifteenth Street, New York, has awarded general contract to Ken Well Construction Co., 45 East Seventeenth Street, for addition to power plant at foot of Fourteenth Street, fronting on East River, to cost approximately \$2,000,000. Thomas E. Murray, Inc., 55 Duane Street, is engineer.

Bart and John P. Walther, 103 East 125th Street, New York, architects, have awarded general contract to J. H. Deeves & Brother, 4 East Thirty-ninth Street, for one-story wire annealing works at 539-53 East 118th Street, for a company whose name is temporarily withheld, to cost about \$40,000 with equipment.

Empire Oil & Refining Co., 60 Wall Street, New York, operated by Cities Service Co., same address, is planning new oil refinery in eastern Iowa, with initial capacity of 10,000 bbl., to be increased later to 20,000 bbl. Project will include construction of 10-in. steel pipe line from Augusta, Kan., to refinery, with booster station facilities for capacity of 40,000 bbl. daily. Development is reported to cost more than \$1,000,000.

Following merger of Direct Control Valve Co., 101 Park Avenue, New York, and Lawler Water Feed & Damper Regulator Co., Mount Vernon, N. Y., under first noted name, arrangements have been made for a stock issue to total \$750,000, portion of proceeds to be used for expansion, including development of plant of Milwaukee Valve Co., Milwaukee, a subsidiary, where production will be largely concentrated.

Andrew J. Thomas, 2 West Forty-sixth Street, New York, architect, has plans for two-story addition, 75 x 200 ft., to automobile service, repair and garage building at 335 East Forty-seventh Street, including improvements in present building, to cost about \$110,000.

Ovens, power equipment, conveying and other machinery will be installed in new three-story and basement plant to be erected by General Baking Co., 420 Lexington Avenue, New York, at Norfolk, Va., to cost over \$125,000. C. B. Comstock, 110 West Fortieth Street, New York, is architect and engineer.

Texas Corporation, 17 Battery Place, New York, is planning extensions in oil refinery at Lockport, Ill., to increase capacity from 7500 to 15,000 bbl. per day. A trunk pipe line will be constructed from vicinity of Tulsa, Okla., to refinery site. Company is also planning to enlarge capacity of three refineries in Texas and one in Wyoming, including additional connections with pipe line system. Entire project is reported to cost over \$2,000,000 with equipment.

Clarence D. Chamberlin, technical advisor and director of Crescent Aircraft Corporation, Lindenhurst, L. I., has purchased factory property at Jersey City, N. J., totaling 10 acres of land, with buildings aggregating 120,000 sq. ft. floor space, and will remodel for manufacture

New York

NEW YORK, Sept. 25.—Among the buyers of machine tools in the last week were the General Electric Co., Schenectady; the North East Electric Co., Rochester, N. Y., and the Pratt & Whitney Aircraft Co., Hartford, Conn. R. Hoe & Co., New York, printing press manufacturers, bought a large Ingersoll milling machine and are expected to close shortly on about eight planers, some of large size. The volume of business so far this month has been equal to that of August, and some sellers report that their sales are running ahead of last month's. Developments of the past week indicated, as have those of previous weeks, that machine tool buying is on a steady, healthy basis and that the present volume of activity may be expected to continue throughout the fall.

Niles-Bement-Pond Co. reports sales of a 48 x 48-in. x 16-ft. Time Saver planer, 6-ft. radial drill, three 36-44-in. side-head

The Crane Market

BUSINESS in overhead electric cranes continues rather limited with only a small volume of new inquiry and buyers slow to place orders. Although the locomotive crane field is quiet at present, subway contracts not yet awarded and a water supply tunnel contract from Yonkers, N. Y., to Brooklyn are expected by sellers to provide some new contractors' requirements in cranes and

shovels. Among the contractors who may have equipment requirements in connection with subway construction are La Rocca Construction Corporation, Rosenthal Engineering Contracting Co., and D. C. Serber, Inc., all in New York. The Colonial Sand & Gravel Co., New York, is reported to have closed on a crawl-tread locomotive crane.

Among recent purchases are:

Steel Company of Canada, Ltd., Hamilton, Ontario, two 175-ton ladle cranes and one charging machine from Morgan Engineering Co.

Youngstown Sheet & Tube Co., Youngstown, 40-ton, 85-ft. span mill crane from Morgan Engineering Co.

Century Electric Co., St. Louis, 10-ton, 76-ft. span, overhead electric crane from Manning, Maxwell & Moore, Inc.

of airplanes and parts. Chamberlin Aeronautical Corporation, recently organized, and Crescent company will occupy plant jointly, each developing manufacture of different types of aircraft. It is understood that works at Lindenhurst will be removed to new location.

Board of Education, New Milford, N. J., plans installation of manual training equipment in new three-story high school to cost \$400,000, for which bids have been asked on general contract. Ernest Sibley, Bluff Road, Palisade, N. J., is architect.

Lionel Corporation, 605 East Twenty-first Street, Irvington, N. J., manufacturer of electric toys, has plans for new one and two-story plant in Hillside district, 390 x 620 ft., to cost over \$200,000 with equipment. Austin Co., New York, is architect and engineer.

Newark Transformer Co., 17 Frelinghuysen Avenue, Newark, manufacturer of electric power equipment, has acquired property at 62 Sherman Avenue, 25 x 100 ft., and plans construction of an addition, to cost about \$40,000.

New England

BOSTON, Sept. 25.—Large machine tool users have not been a market factor in months. Business placed with dealers in September has been mainly from Connecticut firms. In the past week \$30,000 worth of tools was sold to one company. Small tools continue active.

According to latest reports available from the United States Employment Bureau, Massachusetts metal-working establishments are operating at capacity and certain cities indicate a shortage in high-skilled labor. In Maine, the majority of machine shops are moderately busy and in one section iron works are operating overtime. In Connecticut, metal-working plants in general are working overtime, while in Rhode Island a shortage of high-skilled workmen continues. In Vermont the situation is spotty, but on the whole optimistic. The few New Hampshire metal-working plants are operating, approximately, on a normal basis.

Lyman Gun Sight Corporation, Middlefield, Conn., has plans for extensions. Details will be announced later.

Work has been started on a \$40,000,000 hydroelectric plant and dam at Munroe, N. H., and Barnet, Vt., for New England Power Co., Worcester, Mass. Lester W. Branch, St. Johnsbury, Vt., is engineer.

Plans will be ready this week for a \$145,000 storage service unit at Middletown, Conn., for Connecticut Power Co., 266 Pearl Street, Hartford. Davis & Walldorff, 17 Whitney Avenue, New Haven, are architects.

Kendall, Taylor & Co., 142 Berkley Street, Boston, architects, close bids Sept. 28 on a \$225,000 fire alarm signal headquarters and other fire department improvements, to include, if possible, a small machine shop, for Newton, Mass. Public building commissioner, City Hall annex, will pass on final papers.

Plans will be ready about Oct. 16 for a municipal sewage disposal plant at Fields Point section, Providence, R. I. T. J. Hill Pierce, City Hall, Providence, has plans.

Contract has been let by French Mfg. Co., Waterbury, Conn., manufacturer of bronze and copper tubing, to Torrington Building Co., Torrington, Conn., for one-story addition, 60 x 200 ft., to cost about \$50,000 with equipment.

Hygrade Lamp Co., Salem, Mass., manufacturer of incandescent electric lamps, has purchased Vosburgh Miniature Lamp Co., Orange, N. J., specializing in small electric lamp units, and will remove latter works to Salem, where expansion will be carried out. A few months ago, Hygrade company acquired Triumph Lamp Co., Indianapolis, and has consolidated with its organization at Salem.

Gilbert & Bennett Co., Georgetown, Conn., manufacturer of wire cloth, has awarded general contract to H. Wales Lines Co., Meriden, Conn., for a one-story addition for mechanical cleaning. Greenwood & Noerr, 847 Main Street, Hartford, Conn., are engineers.

Goss & De Leeuw Machine Co., New Britain, Conn., manufacturer of chucking machinery and parts, has awarded general contract to Aberthaw Co., Boston, for one-story addition, 100 x 175 ft., to cost about \$50,000 with equipment.

H. T. McCluskey & Sons, Inc., 525 Grand Avenue, New Haven, Conn., manufacturer of wire cloth, has awarded general contract to Emil W. Lundstrom, Hamden, Conn., for one-story addition, 42 x 60 ft. Dwight E. Smith, New Haven, is architect.

Board of Works, Springfield, Mass., has taken out a permit for a new pumping station for municipal water system, to cost \$90,000 with pumping units and other equipment.

South Atlantic

BALTIMORE, Sept. 25.—Crown Cork & Seal Co., 1511 Guilford Avenue, Baltimore, manufacturer of metal bottle caps, bottle-capping machinery, etc., is having plans completed by L. R. White, Hearst Tower Building, architect, for one and two-story addition, 150 x 600 ft., to cost over \$175,000 with equipment. Bids will be asked on general contract in October.

International Harvester Co., 606 South Michigan Avenue, Chicago, has asked bids on general contract for new factory branch, storage and service plant for motor truck division at Baltimore, one story, 125 x 250 ft., to cost over \$125,000 with equipment. W. D. Price, company headquarters, is engineer, in charge.

Carolina Power & Light Co., Raleigh, N. C., is disposing of bond issue of \$2,500,000, part of proceeds to be used for extensions and improvements in power plants and system.

Board of District Commissioners, District Building, Washington, will receive bids until Oct. 5 for cast iron lamp posts and fittings, including 60 post bases; 50 frames for fire alarm posts; 25 lamp post shafts; 30 frames for police patrol posts.

Franklin Mineral Products Co., Franklin, N. C., John Davenport, general manager, will erect new mica grinding mill, comprising main one-story unit, 30 x 185 ft., with grading plant, 30 x 100 ft., boiler house and other buildings, to cost about \$55,000 with machinery.

Medley Mfg. Co., Columbus, Ga., has been organized to take over and expand local plant and business of Tom Huston Mfg. Co., manufacturer of peanut-shelling machinery and kindred equipment.

General Purchasing Officer, Panama Canal, Washington, will receive bids until Oct. 4 for centrifugal pumping units, car-wheels, and other equipment, Panama Schedule 1903.

Raymond C. Snow, Bona Allen Building, Atlanta, Ga., architect, has plans for one-story and basement automobile service, repair and garage building, 100 x 165 ft., to cost about \$100,000 with equipment.

Merchants' Storage & Refrigeration Co., Baltimore, recently organized by George H. Jarboe, 4001 Frederick Avenue, and associates, has acquired former local plant of Shafer Refrigerating Co., and will remodel for new cold storage and refrigerating unit, including installation of additional equipment.

Board of Education, Winston-Salem, N. C., plans installation of manual training equipment in two new junior high schools, one to be within city limits and other at South Winston-Salem; also in new high school for colored students. New structures will be built in connection with school expansion program to cost \$2,500,000, for which bond issue will soon be sold.

Bureau of Yards and Docks, Navy Department, Washington, will receive bids (no closing date announced) for 125-hp. return flue fire box boiler, with fuel oil burner, stack and accessories, for naval air station at San Diego, Cal., specification 5483.

Buffalo

BUFFALO, Sept. 24.—Plans have been filed by Houde Engineering Corporation, 537 East Delavan Avenue, Buffalo, manufacturer of automobile shock absorbers, etc., for one-story plant unit to cost \$75,000.

Nichols & O'Connor, Cahill Building, Syracuse, N. Y., architects, have plans for a one-story automobile service, repair and garage building, to cost \$140,000 with equipment.

Carborundum Co., Niagara Falls, N. Y., manufacturer of abrasive products, is planning construction of three-story factory branch and distributing plant at Detroit, to cost over \$60,000 with equipment.

Department of Correction, Albany, N. Y., is planning construction of new one-story mechanical shop at State prison at Auburn, N. Y.

Cherry-Burrell Corporation, Little Falls, N. Y., has been organized to take over D. H. Burrell & Co., manufacturer of dairy machinery, with local plant, and J. G. Cherry Co., Cedar Rapids, Iowa, maker of similar equipment, as well as Cherry-Bassett Co., a subsidiary of last-noted, John W. Ladd Co., Detroit, Wright-Ziegler Co., Boston, and Milwaukee Dairy Supply Mfg. Co., Milwaukee, all manufacturers of like machinery, including ice cream freezers, etc. Consolidated organization has arranged for bond issue of \$2,000,000 to provide for merger and expansion in output.

Board of Contract and Supply, Utica, N. Y., is considering one-story equipment storage and distributing plant, with mechanical department, to cost about \$50,000.

Chisholm-Moore Hoist Corporation, recently at Cleveland, removed its general offices to Tonawanda, N. Y., on Sept. 1. Branch office with complete line of hoists will be continued at Cleveland.

Pittsburgh

PITTSBURGH, Sept. 24.—There is still a fairly active inquiry for machine tools in this district and while actual sales leave something to be desired a few firms are well satisfied with recent transactions. One company handling a line of special pipe mill tools has done enough business to consider September a good month.

The Steel Co. of Canada, has distributed orders for ladle cranes, chargers and other steel works equipment through a local consulting engineer and it is expected that the cement mill equipment will soon be placed for the Davison Coke & Iron Co., which recently acquired the Neville furnace of the American Steel & Wire Co. and now is engaged in construction work on a by-product coke plant and power house in addition to the cement works. A large order for power plant equipment for this company recently was placed. In addition to purchases of motors for its blooming and billet and bar mills, the Youngstown Sheet & Tube Co. has bought two compressors for the blooming mill.

Peters Gas Coal Co., Finleyville, near Washington, Pa., is said to be planning to rebuild part of tipple recently destroyed by fire, with loss over \$75,000 with equipment.

James H. McQuade & Sons Co., Magee Building, Pittsburgh, contractor, has ac-

quired property, 100 x 130 ft., at Bloomfield, for equipment and machinery storage and distributing plant, with repair facilities.

Parkersburg Rig & Reel Co., Harris Street, Parkersburg, W. Va., manufacturer of oil well machinery, parts, etc., has awarded general contract to Plate Construction Co., 726 Jeanette Street, for one-story addition to cost about \$75,000 with equipment.

Continental Refining Co., Oil City, Pa., has plans for a two-story addition to cost about \$30,000.

Board of County Commissioners, City-County Building, Pittsburgh, has fund of \$1,500,000 for purchase of land and construction of airport, including hangars, service and repair shops, oil storage and other buildings. City Council is arranging to cooperate and will contribute additional fund of about \$500,000.

General offices and drafting rooms of Steel Frame House Co., a subsidiary of McClintic-Marshall Co., have been transferred from Leetsdale, Pa., to Oliver Building, Pittsburgh.

Homestead Valve Mfg. Co., Inc., Homestead, Pa., manufacturer of valves and vapor cleaning machines, has purchased plant on Narrows Run Road near Coraopolis, Pa., and will remove factory and offices to new location Oct. 1. Property consists of 108-acre tract with three-story factory building, office building, foundry and additional structures which will be used for pattern shop and storage.

Cleveland

CLEVELAND, Sept. 24.—Machine tool sales were good the past week, showing some gain over the early part of the month. Good sized orders were placed by two or three Michigan automobile companies. There was a fair amount of activity in single machines in the Cleveland territory, largely from manufacturers of automobile parts. The Eaton Axle & Spring Co., Cleveland, is in the market for special milling, grinding and other machinery to equip a plant extension. Machine tool manufacturers are getting quite a little business from the airplane industry, indicating the growing importance of that industry as an outlet for machine tools. Turret lathes are moving in fair volume, although September sales will fall somewhat below those of August.

Eaton Axle & Spring Co., Cleveland, is having plans prepared for a \$1,000,000 extension to its East 140th Street plant, providing additional floor space of 120,000 sq. ft.

Superstructure will be started by Hahn Mfg. Co., 5332 Hamilton Avenue, Cleveland, for one-story machine shop, 40 x 73 ft., to cost about \$37,000 with equipment.

W. S. Tyler Co., 3600 Superior Avenue, Cleveland, manufacturer of wire cloth, ornamental bronze and iron products, etc., has plans for a five-story addition, 66 x 100 ft., to cost more than \$200,000 with equipment.

Goodyear Zeppelin Co., operated by Goodyear Tire & Rubber Co., Akron, Ohio, has secured award from Navy Department, Washington, for construction of two dirigibles, to cost approximately \$8,000,000, and contemplates establishment of new plant to carry out project.

General Fire Extinguisher Co., Warren, Ohio, operated by Grinnell Co., Providence, R. I., is said to be arranging for

use of part of adjoining plant of Warren Iron & Steel Co., recently acquired, for expansion.

Detroit

DETROIT, Sept. 24.—Contract has been let by Long Mfg. Co., 2768 East Grand Boulevard, Detroit, manufacturer of automobile radiators, clutches, etc., to Edward Chase, Detroit, for a two-story addition, to cost more than \$50,000 with equipment. George V. Pottle, David Whitney Building, is architect.

Buick Motor Co., Flint, Mich., has plans for a three-story factory branch, service and repair building at Dallas, Tex., to cost \$110,000 with equipment.

Kalamazoo Stationery Co., Harrison Street, Kalamazoo, Mich., has filed plans for a power plant, 50 x 50 ft., to cost \$50,000 including equipment.

Briggs Mfg. Co., 11631 Mack Avenue, Detroit, manufacturer of automobile bodies, has plans for a one-story addition, 80 x 100 ft., to cost about \$40,000 with equipment. Albert Kahn, Marquette Building, is architect and engineer.

Plans have been arranged for a merger of Bennett Pump Corporation, Muskegon, Mich., manufacturer of pumping machinery and parts, and Service Station Equipment Co., Ltd., Toronto, manufacturer of kindred machinery. A holding company will be formed with capital of \$6,500,000 to carry out consolidation; each organization will maintain present identity. An expansion program will be carried out. Thomas Bennett will head new company.

Steel & Tubes, Inc., 224 East 131st Street, Cleveland, has awarded a general contract to H. G. Christman Co., Stevens Building, Detroit, for initial unit of new one-story plant, 210 x 500 ft., at Ferndale, Mich.

Clark Equipment Co., Buchanan, Mich., manufacturer of automobile axles, transmissions, metal wheels, etc., is completing work on one-story addition, 180 x 255 ft., at branch plant at Battle Creek, Mich., to be occupied within next 60 days. An office and executive building has been completed at latter works, and space formerly used for such service will be given over to production. Extensions will be made at branch plant at Berrien Springs, Mich.

Detroit Gasket Mfg. Co., 6309 Hamilton Avenue, Detroit, has awarded general contract to J. H. Reidinger Co., 6537 Russell Street, for one and two-story addition, with boiler house, to cost about \$75,000 with equipment. C. W. Brandt, 2111 Woodward Avenue, is architect.

Carborundum Co., Niagara Falls, N. Y., manufacturer of abrasive and refractory materials, has broken ground for general warehouse and sales office building at Detroit. It will be three stories and basement, 110 x 250 ft., containing 50,000 sq. ft. of floor space. General contract has been let to Walbridge-Aldinger Co. and erection will be under supervision of L. J. Call, engineer Carborundum Co., Niagara Falls.

Aluminum Steel Products Co., Plainwell, Mich., has been organized to manufacture aluminum levels and aluminum castings. It has rented former local plant of Wolverine Casting Co. and has installed machinery removed from plant at Royal Center, Ind. Company is prepared for operation and no additional equipment will be purchased.

Wings, Inc., 309 Dearborn Building, Dearborn, Mich., has been organized as manufacturers' agent for materials, ac-

cessories and parts used in manufacture of airplanes; to distribute airplanes and accessories through dealer organization and to operate flying school. Later company expects to take on lines of steel tubing and stream line wire and will construct buildings. C. V. Burnett is secretary and treasurer.

Milwaukee

MILWAUKEE, Sept. 24.—While new orders are not quite as numerous as earlier in the month, the September total of sales is expected to compare favorably with August. Inquiry continues active and the outlook for October business is considered favorable. Current sales run mainly to single items, but these are of good number and cover a wide range of industries. Automotive needs have declined somewhat after the heavy buying of the past three months.

Wisconsin Power & Light Co., 16 North Carroll Street, Madison, Wis., is taking estimates on equipment for a hydroelectric power plant, costing \$150,000, at Rockton, Ill., consisting of two 600-kva. generators, two 750-hp. turbines, and auxiliaries. Bids on building will not be taken until equipment has been purchased. Company also will buy a 500-hp. boiler for a new boiler house at Beaver Dam, Wis. E. J. Kallewang is chief engineer.

Thompson Brothers, DePere, Wis., boat builders, will erect a one-story factory and warehouse addition, 100 x 160 ft., and are in market for wood and metal-working machinery.

Northern Conveyor Co., Janesville, Wis., contemplates erection of additions to double its capacity. Company erected an extension and increased its area 50 per cent last spring but is overcrowded. Detailed plans for further construction and equipment are under way.

Prentice-Wabers Products Co., Wisconsin Rapids, Wis., manufacturer of gas-line camp cook stoves, metal tables, chairs and cots, has placed contracts for a factory and warehouse addition, 70 x 176 ft., and a loading platform, 10 x 176 ft.

Nash Motors Co., Kenosha, Wis., has started work on additions to its branch factory at Racine, Wis., which will cost over \$600,000. A new enameling unit with an "A" type oven and body storage house of 100,000 sq. ft. are principal items. Gear and axle shop, forge and heat treating departments and power plant also will be enlarged. D. M. Averill is general manager of Racine division.

Board of Regents, University of Wisconsin, expects to be ready about Nov. 1 for bids for construction of new mechanical engineering building, plans for which are being drawn by Arthur Peabody, State architect, Madison. An appropriation of \$577,000 is available. M. E. McCaffrey is secretary of Board of Regents.

Hill-Hubbell Co., 160 Fremont Street, San Francisco, has placed general contract with Meredith Brothers Co., 253 Washington Street, Milwaukee, for a brick and steel shop, 50 x 150 ft., on property of A. O. Smith Corporation, Milwaukee, for processing electrically welded steel pipe made by Smith company for oil and gas fields. H. Hough is manager at Milwaukee.

Zenith Foundry Co., 567 Seventy-fifth Avenue, West Allis, Milwaukee, is building a shop addition costing about \$20,000.

Simonds-Worden-White Co., Dayton, Ohio, has purchased R. J. Dowd Knife

Works, Beloit, Wis. B. H. Meyer will be manager of Beloit works, but general offices will be in Dayton. Purchasing company is a recent consolidation of several firms in cutlery industry.

Milwaukee Foundry Equipment Co., 284 Seventh Avenue, Milwaukee, manufacturer of molding machines, has acquired tract of 92,000 sq. ft. and will erect manufacturing building.

Chicago

CHICAGO, Sept. 24.—With the close of the third week in September it is evident that sales for this month will not reach the August total, but will compare favorably with July which was considered good. Orders are more widely scattered and there is less broadcast inquiry, but business is coming quietly and in good volume from all sections of this district.

Studebaker Corporation, South Bend, Ind., is studying future requirements and Nash Motors Co., Racine, Wis., is building an addition. It is reported that Ford Motor Co. is planning to resume manufacture of tractors and will need some machine tool equipment. Allis-Chalmers Mfg. Co. has completed purchases for its tractor plant at Springfield, Ill., and is negotiating for equipment for its West Allis, Wis., plant. Chicago, Milwaukee, St. Paul & Pacific list is active.

Gray Goose Airplane Co., Hearst Building, Chicago, will build a hangar, 116 x 117 ft., to cost \$50,000.

Commonwealth Edison Co., 72 West Adams Street, Chicago, will build a substation, 100 x 160 ft., to cost \$200,000. MacDowell Construction Co., 140 South Dearborn Street, is general contractor.

Ketler-Elliott Erection Co., Chicago, will build a three-story foundry and machine shop, 80 x 90 ft. It will cost \$90,000.

Fire and an explosion wrecked two-story brick factory of Rome Co., maker of bed springs, 1313 South Fifty-fifth Court, Cicero, Ill., with damage estimated at \$150,000.

Accurate Steel Treating Co., Inc., Chicago, has removed to its new plant at 2226-28 Austin Avenue. Considerable additional equipment has been installed.

Oldfield Engineering Co., 2632 West Twenty-sixth Street, Chicago, manufacturer of gas plant equipment, is erecting two one-story units on site, 150 x 679 ft., recently acquired at Cicero, Ill., to total about 24,000 sq. ft. of space, and will remove to new location, with installation of additional equipment. Other structures will be built at Cicero later. Initial project will cost more than \$85,000. Otto Randolph, Inc., 53 West Jackson Boulevard, is engineer and contractor.

International Harvester Co., 606 South Michigan Avenue, Chicago, is said to have plans for one and two-story additions to plant at Rock Island, Ill., to cost more than \$500,000 with equipment. Contract has been let to H. K. Ferguson Co., Cleveland, for a new unit at Canton, Ill., plant, for grinding and steel shearing service, to cost \$100,000 with equipment.

Knight Soda Fountain Co., 2701 North Kildare Avenue, Chicago, manufacturer of soda fountains and accessories, has asked bids on general contract for one-story addition, to cost about \$40,000 with equipment. G. W. Klewer, 5 North La Salle Street, is architect.

City Council, Benson, Minn., will rebuild municipal electric light and power

plant, to cost more than \$45,000 with equipment. Arthur L. Mullergren, Board of Trade Building, Kansas City, Mo., is engineer.

Rapid City Airplanes, Inc., Rapid City, S. D., has plans for a hangar, with machine and repair facilities, at municipal airport at Huron, S. D., to cost about \$25,000.

M. L. Kramer, 134 North La Salle Street, Chicago, architect, has awarded general contract to Callner Construction Co., same address, for three-story automobile service, repair and garage building, to cost about \$300,000 with equipment.

Dahlin Brothers & Davis Mfg. Co., Minneapolis, Minn., manufacturer of furniture, has purchased site, 175 x 200 ft., at Burlington, Iowa, for new branch factory to cost about \$40,000 with equipment.

About \$1,000,000 damage was done to several plants by tornado which swept factory district in Rockford, Ill., Sept. 14. Loss to Elco Tool & Screw Co. was \$200,000; National Lock Co., \$10,000; Estwing Mfg. Co., \$100,000; Rockford Chair Co., \$200,000; South Union Furniture Co., \$75,000, and Mechanics Machine Co., \$10,000.

Philadelphia

PHILADELPHIA, Sept. 24.—Board of Education, Keystone Building, Philadelphia, is considering installation of manual training equipment in new four-story high school at Front and Ashaales Streets, to cost more than \$2,000,000, for which plans are being drawn by Irwin T. Catharine, address noted, architect for board. Similar installation is also proposed in senior high school to be erected at Moore and Mifflin Streets, to cost more than \$1,000,000, for which plans are being prepared by same architect.

Philadelphia Rapid Transit Co., Mitten Building, Philadelphia, has filed plans for one-story car shop, to cost about \$65,000 with equipment.

Railway Track-Work Co., East Thompson and Clementon Streets, Philadelphia, has plans for a new one-story machine shop, 56 x 100 ft., to cost about \$40,000 with equipment.

Philadelphia Air Terminal, Inc., Philadelphia, represented by Francis B. Biddle, Morris Building, attorney, has been organized to establish and operate a local airport. About 140 acres has been secured at South Philadelphia and plans are under way for hangars, repair and reconditioning shops, oil storage and other buildings. Project is reported to cost about \$1,000,000.

White Co., 842 East Seventy-ninth Street, Cleveland, manufacturer of motor trucks, has awarded general contract to Barclay White & Co., 22 North Thirty-sixth Street, Philadelphia, for one-story and basement factory branch, service and repair station, 75 x 100 ft., Philadelphia, to cost more than \$75,000 with equipment. Hadlow, Hughes & Hicks, Conrad Union Mortgage Building, Cleveland, are architects.

Board of Education, Pleasantville, N. J., is planning installation of manual training department in new two-story high school in Ansley Park section to cost about \$600,000, for which revised plans are being prepared by S. Hudson Vaughn, Guarantee Trust Building, Atlantic City, N. J., architect.

Reading Coal & Iron Co., Reading Terminal, Philadelphia, is reported plan-

ning construction of new coal breaker near Locust Summit, Pa., with electrically-operated machinery, to cost more than \$400,000 with equipment. Company has begun construction of new breaker at Westwood, Pa., to cost close to same sum.

Board of Education, Scranton, Pa., plans early call for bids on general contract for four-story addition to technical high school, to cost about \$500,000 with equipment. A. J. Ward, Scranton-Lackawanna Office Building, is architect. Tudor Williams, Scranton Life Building, is supervising engineer.

American Welding Co., Carbondale, Pa., is planning enlargements to double, approximately, size and capacity, to cost more than \$100,000. Company is a subsidiary of American Car & Foundry Co., 30 Church Street, New York.

Cincinnati

CINCINNATI, Sept. 24.—While machine tool orders have been in fairly good volume, the September total is expected to fall considerably below that of August. However, this is not a surprising development in view of the fact that August bookings attained "boom" proportions. There are, of course, several exceptions to the general run of activities, at least two important builders having reported that sales this month are from 15 to 25 per cent above those of August. That the present satisfactory conditions are likely to continue during the remainder of September and in October is the opinion of local machine tool executives, based on the large volume of pending inquiries.

A substantial portion of business placed in the past 30 days is traceable either directly to automobile manufacturers or to companies dependent upon the automotive industry. The widespread buying in that field is attributed to changes in equipment necessitated by building new models and to the need of reducing manufacturing costs to meet low-priced competition. Another source of recent orders is oil companies in the Southwest and also companies making tools for use in oil fields.

Production of Cincinnati machine tool builders is being sustained on a high plane and unfilled orders on hand are sufficient to insure the maintenance of present operating schedules indefinitely.

Trailer Co. of America has been organized in Cincinnati as a holding company and has acquired control of Trailmobile Co. of that city and Lapeer Trailer Corporation, Lapeer, Mich. Both companies will continue to operate as separate manufacturing and selling organizations under direction of J. Englaender, president, and S. B. Winn, vice-president and general manager. Caleb W. Shipley, former president of Trailmobile Co., has retired from management of that company.

City Council, Columbus, Ohio, contemplates construction of municipal airport, with hangars, repair and service shops, oil storage and other buildings. A fund of \$180,000 is being arranged for project.

New mill of Tennessee Copper & Chemical Co., Copperhill, Tenn., one story, 210 x 420 ft., will be located at Evandale, Ohio, instead of Copperhill, previously announced. It will cost over \$400,000 with equipment.

Gilbert Chevrolet Co., 2131 Gilbert Avenue, Cincinnati, local representative for Chevrolet automobile, has plans for four-

story service, repair and sales building to cost about \$100,000 with equipment. Architectural department, General Motors Corporation, Detroit, is in charge.

Knoxville Power & Light Co., Knoxville, Tenn., is planning for installation of new converter station for power service for traction lines, to cost about \$50,000.

Gardner-Harvey Container Co., Middletown, Ohio, recently organized by Edward T. Gardner and associates, has awarded general contract to F. K. Vaughn Co., Hamilton, Ohio, for new mill to manufacture corrugated box-board containers, comprising main one-story plant, 120 x 540 ft., with storage and distributing building, 54 x 200 ft., to cost \$300,000, of which more than \$100,000 will be used for equipment. Management, Engineering & Development Co., Dayton, Ohio, is engineer.

Metal Aircraft Corporation, Cincinnati, has awarded general contract to Ferro Concrete Construction Co., Third and Elm Streets, for one-story plant, to cost about \$60,000 with equipment.

LeBlond-Schacht Truck Co., Eighth and Evans Streets, Cincinnati, has purchased O. Armleder Motor Truck Co., Twelfth and Plum Streets, and will operate as subsidiary. New company will be organized as division of purchasing company to operate Armleder department. It is purposed to concentrate production largely at works of purchasing company, which will be expanded.

St. Louis

ST. LOUIS, Sept. 24.—Contract has been let by Chandeysson Electric Co., 4092 Bingham Avenue, St. Louis, manufacturer of plating electric units and kindred apparatus, to Widmer Engineering Co., Roosevelt Building, for one-story addition, to cost \$60,000 with equipment.

Skelly Oil Co., 2605 Walnut Street, Kansas City, Mo., is having plans drawn for a two and four-story oil storage and distributing plant, 60 x 160 ft., to cost about \$40,000 with equipment. Stephen C. Kenney, Gloyd Building, is architect.

American Crystal Co., 1031 Schafeld Building, Cleveland, is arranging for development of mineral properties near Caddo Gap, Ark., where about 350 acres has been secured, installation to include pumping machinery, electric power equipment, drills, etc.

City Council, Texarkana, Ark., has acquired 200 acres as site for municipal airport, and contemplates construction of hangars, repair and reconditioning shops, oil storage and other buildings.

Jerpe Cold Storage Co., 1116 Douglas Street, Omaha, Neb., has plans for four-story cold storage and refrigerating plant addition, to cost about \$65,000 with equipment. J. T. Allen and N. S. Wallace, Brandeis Theater Building, are architects.

Layton, Hicks & Forsythe, Oklahoma City, Okla., architects, have plans for five-story automobile service, repair and garage building, to cost more than \$100,000 with equipment.

Arkansas Natural Gas Corporation, George T. Koch, Ardis Building, Shreveport, La., chief engineer, has awarded contract to Booth & Flinn, Inc., 1942 Forbes Street, Pittsburgh, for construction of pipe line from Clarksville to Little Rock, Ark., about 105 miles, to cost more than \$500,000 with compressor stations and other mechanical equipment.

Texaco Oil Co., Third and M Streets, Lincoln, Neb., has plans for new storage

and distributing plant to cost about \$40,000 with equipment.

Missouri Pacific Railroad is in market for one 44-in. side head-boring and turning mill, motor-driven, with four-jaw independent chuck table.

City Council, Poplar Bluff, Mo., has approved report of special committee recommending calling special election to vote \$225,000 bonds for new filtration plant, additional water tower, and installation of meters on all hydrants for city's waterworks.

Conveying machinery, power, processing and other equipment will be installed in new mill at Denver, of Ralston Purina Co., 827 South Eighth Street, St. Louis, to cost about \$500,000. Project will include a power house.

Gulf States

BIRMINGHAM, Sept. 24.—Officials of Kane Boiler Works, Inc., Galveston, Tex., have organized new company of same name, with capital of \$200,000, to take over and expand present plant and business.

Kansas City Southern Railroad Co., Kansas City, Mo., is arranging an expansion program at Dowling yards, near Beaumont, Tex., to include new engine house, machine shop, power house and other units, entire project to cost more than \$500,000, including additional yard facilities, turntable, etc.

Roller Stock Guards Corporation, Anniston, Ala., recently organized with capital of \$50,000 to manufacture roller type steel cattle guards for railroads, has acquired local property for erection of one-story plant, to cost close to \$30,000 with equipment. M. P. Lightfoot is president.

E. J. Roberts, Comanche, Tex., and associates are planning construction of new ice-manufacturing plant at Mineral Wells, Tex., to cost \$50,000 with machinery.

State Board of Control, Austin, Tex., is considering construction and operation of State-owned cement mill for initial output of 500 bbl. per day, to cost about \$500,000 with machinery.

Smith Brothers Properties, Inc., 117 Villita Street, San Antonio, Tex., has awarded general contract to McKenzie Construction Co., Travis Building, for seven-story automobile service, repair and garage building, 90 x 100 ft., to cost over \$250,000 with equipment.

Texas-Worth Tool Co., Fort Worth, Tex., oil well tools and equipment, has leased a building at 2400 West Seventh Street, and will remodel for new manufacturing plant.

Rome Electric Range Co., Huntsville, Ala., is completing plans for new plant, with initial unit one story, 50 x 250 ft., to cost over \$60,000 with equipment.

Edcouch Machine & Electric Co., Edcouch, Tex., A. P. Peters, head, has awarded general contract to Stone & Phillips, Wescalo, Tex., for two-story machine shop, to cost about \$30,000 with equipment.

Pan-American Airways, Inc., Miami, Fla., recently organized, has purchased 130 acres at N. W. Thirty-sixth Street and Forty-second Avenue, and plans construction of new airport, including hangars, service and repair shops, oil storage and other buildings, to cost about \$50,000. Headquarters are at 100 East Forty-second Street, New York. Delano & Aldrich, 126 East Thirty-eighth Street, are architects.

Worsham Buick Co., Pacific Avenue and Olive Street, Dallas, Tex., representative for Buick automobile, has filed plans for three-story service, repair and sales building, 152 x 215 ft., to cost \$175,000 with equipment. C. H. Griesenbeck, Dallas, is architect.

Todd Dry Dock & Shipbuilding Co., Mobile, Ala., has acquired 10 acres of waterfront property adjoining plant, and plans construction of additional units, to cost over \$100,000 with equipment.

Gulf Power Co., Pensacola, Fla., is disposing of a preferred stock issue of about \$720,000, a portion of proceeds to be used for extensions and improvements in power plants and system.

Pacific Coast

SAN FRANCISCO, Sept. 20.—Plans are being considered by Bach Aircraft Co., Los Angeles, for new plant at Metropolitan Airport, near North Hollywood, to consist of parts and assembling departments. Airport organization has plans for two hangars, 100 x 130 ft., with machine and repair facilities, and will begin work soon. Waldo Waterman is manager of Metropolitan Airport.

Stauffer Chemical Co., Los Angeles, will build a one-story machine shop in connection with new plant at Dominguez Junction, near Compton, for which general contract has been let to Union Iron Works, Los Angeles. Project will cost about \$100,000 with machinery.

Los Angeles Can Co., Los Angeles, is planning to rebuild part of plant destroyed by fire Sept. 15, with loss of about \$200,000 including equipment.

Richfield Oil Co., Bartlett Building, Los Angeles, has plans for new oil storage and distributing plant on Sacramento River, near Sacramento, Cal., to cost about \$750,000 with equipment. Project will include machine shop, automobile service and repair building, pumping station and other units. Henry Carr is company engineer at Los Angeles, in charge.

J. H. Henry and associates, Pasadena, Cal., care of H. E. Tabor, Pasadena, engineer, has plans for lumber mill, with machine shop, power house and auxiliary structures near Pinehurst, vicinity of Medford, Ore., to cost about \$175,000 with equipment.

Arizona Edison Co., Douglas, Ariz., is planning new power house at Naco, Ariz., and will remove present steam-operated electric station at Bisbee, Ariz., to that location, where additional equipment will be provided for increase in output. Extensions will be made in transmission lines.

Texas Co., Yeon Building, Portland, has filed plans for a one-story pipe shop, with power house and pumping station at its oil storage and distributing plant on St. Helens Road, to cost about \$35,000 with equipment.

Inland Empire Paper Co., Spokane, Wash., has authorized plans for expansion at its mill at Millwood, near Spokane, to double present capacity, and to cost more than \$250,000 with machinery.

Pacific Coast Cement Co., 3801 Marginal Way, Seattle, has plans for two new units, to cost about \$45,000 with equipment.

Municipal power department, Seattle, has plans for new municipal hydroelectric power plant at Diablo dam, to cost \$3,000,000 with machinery and transmission lines. A bond issue has been arranged. W. D. Barkhuff is city engineer.

Fir-Tex Insulating Board Co., St. Helens, Ore., recently organized by Herbert Fleishhacker, San Francisco; Kenneth D. Dawson, Portland, and associates, has plans for new mill at St. Helens, with initial units covering area of 100 x 1400 ft. A power house, machine shop and other units will be built. Project is estimated to cost \$2,000,000 with machinery. H. F. McCormick, St. Helens, will be an official of new company.

Indiana

INDIANAPOLIS, Sept. 24.—Studebaker Corporation, South Bend, Ind., has plans for one-story addition, 62 x 302 ft., to cost about \$80,000 with equipment. Company is also having plans drawn for one-story oil storage and distributing building, 72 x 180 ft., to cost about \$40,000 with equipment. Lockhart & Fett, Associates Building, are architects for both structures. Permit has been secured for new one-story unit to cost about \$50,000, and for a one-story machine shop, 307 x 425 ft., to cost approximately \$270,000 with equipment.

Conveying machinery, power and other equipment will be installed in new powdered milk plant to be built by Hoosier Milk Condensery Co., Bluffton, to cost close to \$50,000 with machinery.

National Tile Co., Anderson, Ind., has plans for a one-story addition, 88 x 415 ft., with tunnel kiln, loading racks, kiln cars, and other equipment, to cost more than \$100,000.

Roxana Petroleum Corporation, 520 Meyer-Kiser Building, Indianapolis, has plans for a two-story and basement, 70 x 100 ft., storage and distributing plant, to cost close to \$30,000 with equipment.

Board of Education, Kokomo, Ind., is said to be planning installation of manual training equipment in four-story addition to high school, to cost more than \$190,000 with equipment. H. B. Bartlett, 1050 North Delaware Street, Indianapolis, is architect.

Canada

TORONTO, Sept. 24.—Machine tool buying in this market continues in good volume. Inquiries are more general and many are expected shortly to be placed. Electric power development is responsible for a growing call for machinery, and new undertakings in this line indicate a continued demand. Steel mills and foundries are also showing considerable interest in the market: the automotive industry is still a big factor.

Walker Brothers, Thorold, Ont., are in market for a second-hand steam engine, 50 to 75 hp.

City Council, Peterborough, Ont., contemplates purchasing two pumps for intermittent pumping station at Maurice and Smith Streets plant.

Mississippi Iron Works, Ltd., Almonte, Ont., contemplates moving its plant to Hull, Que., and it is understood that a new works will be erected.

Johnston Welding & Radiator Co., 2692 Dundas Street West, Toronto, will build an addition and purchase considerable new machinery and tools.

International Harvester Co., of Canada, Ltd., Sherman Avenue North, Hamilton, Ont., has awarded contract to Humphrey Brothers, 214 Wellington Street,

East, for an addition, 60 x 120 ft., to its foundry, to cost \$40,000.

Western Canada

It is reported that Fraser Companies, Ltd., Fredericton, N. B., is arranging for erection of a pulp and paper plant at Prince George, B. C., with daily capacity of 600 tons.

Dominion Government has granted a 30-year lease to North Western Power Co., subsidiary of Winnipeg Electric Co., Winnipeg, to develop hydroelectric power at Seven Sisters Falls power site. Construction work will be started immediately, and a railroad 14 miles long will be built from Whitemouth Junction to site. About \$8,000,000 will be spent on project.

Foreign

BIDS will be received by Electricity Supply Commission of South Africa, Cape Town, until Oct. 26 for plant and equipment for a hydroelectric power station and outdoor substations at Cape Province, Inquiry No. 236.

Swedish Chamber of Commerce of United States, 25 Beaver Street, New York, has received an inquiry, Ref. 278, from a company in Sweden, interested in purchase of American-made air compressors and floor-scraping machines.

Foreign Light & Power Co., organized by J. G. White & Co., 37 Wall Street, New York, and Motor-Columbus Corporation for Electrical Enterprises, Baden, Switzerland, is disposing of a preferred stock issue of \$5,000,000 and will soon arrange additional financing in amount of \$3,500,000 for power acquisitions and development in France, Germany and Italy, including generating stations, transmission lines, etc. New company will be under direction of J. G. White Engineering Corporation, 43 Exchange Place, New York.

Argentine Department of Public Works, Buenos Aires, has approved a project for five new pier docks in north outer port of local harbor, to include mechanical handling machinery, conveying apparatus, loading equipment, etc. Project will cost about 6,185,550 pesos (about \$2,600,000).

Department of Finance, Republic of Chile, Santiago, Senor Don Pablo Ramirez, minister of finance, is disposing of bond issue of \$16,000,000 in United States for construction of railroads, port works, irrigation lines, sewage and waterworks, and public buildings, including mechanical and power equipment.

Broken Hill Proprietary Co., Newcastle, New South Wales, Australia, has approved plans for construction of coke oven plant, with by-products divisions, to cost \$5,000,000 with equipment.

Venezuela Gulf Oil Co., 21 State Street, New York, has closed negotiations with Mexican Seaboard Oil Co., 120 Broadway, and its subsidiary, Venezuelan Seaboard Oil Co., for lease of 40,000 acres on west coast of Lake Maracaibo, Venezuela. Leasing company plans early development for oil production and will install drilling machinery, pipe lines, storage and distributing facilities and other mechanical equipment.

Boston steel treaters will hold their ninth annual banquet and smoker on Monday evening, Oct. 1, at the University Club, Trinity Place, Boston. This will introduce the 1928-1929 program of the Boston chapter of the American Society for Steel Treating.

THE IRON AGE

VOL. 122, No. 14

Obtaining a Satisfactory Zinc Coating

Some Factors Affecting the Quality of Zinc for Hot Galvanizing—Why Iron Is Harmful and Lead Is Not

BY WALLACE G. IMHOFF

ONE of the best ways to obtain a high-quality zinc coating is through the use of a good, reliable brand of zinc for galvanizing purposes. This immediately brings up the question "what factors affect the quality of zinc for zincing?"

Metals may be of practical value because of their chemical composition or because of their physical properties. The American Society for Testing Materials has set a standard for the chemical composition of "Prime Western Slab Zinc," which is that such zinc shall not contain over 1.60 per cent of lead and 0.08 per cent of iron. Prime Western slab zinc is the standard zinc used for galvanizing.

By the time the zinc has reached the coating stage, that is, is hot, molten metal in the galvanizing pot, it contains other metals besides those set by the standards for such zinc. Some of these are put into the zinc purposely; others find their way into the metal during the regular daily operation

of the galvanizing pot. It is of special interest to know about all the metals that are in the zinc, to know how they got there and to know what effect these metals have upon the quality of the zinc coating and the physical properties of the zinc.

Metals found in hot zinc in galvanizing baths are lead, iron, cadmium, aluminum, tin and, occasionally, antimony. Only two of these, lead and iron, are mentioned in the standards for prime Western slab zinc. So it is seen that in some cases it has been thought not undesirable to put other metals in, and in other cases it has been found impossible to keep other metals out. Some of the metals are present in large quantities; others are present in very low percentages. The important thing to know is what metals are present and in what quantities.

Since zinc is present in the largest quantity, it is only natural to ask "Is it possible to galvanize with pure zinc?"

WALLACE G. IMHOFF, formerly metallurgist of the electrical materials department of Hubbard & Co., Pittsburgh, is a consulting metallurgical engineer in pickling and galvanizing at Pittsburgh. His practical experience in the galvanizing field covers 15 years, beginning in the galvanizing department of the American Steel & Wire Co., Rankin, Pa. His technical training was at the Carnegie Institute of Technology, Pittsburgh. He later studied at the University of Wisconsin, Harvard University and the University of Pittsburgh.

In the years following he became actively engaged in the practical operating end of the blast furnace, the basic open-hearth furnace and the electric furnace. After 16 months as a lieutenant in the Air Service, Mr. Imhoff again resumed his work in the steel business as assistant to the general superintendent of an Eastern steel plant.

In 1920 he became research engineer for the Sheet Metal Ware Association of New York and Buffalo, investigating the field of hot galvanizing for 15 large steel companies. This work was carried on for five years at Mellon Institute of Industrial Research, University of Pittsburgh. The investigations included all the troubles that the practical galvanizer is likely to encounter, as well as improved methods in galvanizing. A number of patents were taken out, including one in the field of electric galvanizing.

One of the best practical galvanizers in the country once remarked that the zinc in use was too pure for galvanizing purposes. There at least is still some doubt as to whether spangles can be obtained when pure zinc is used.

It is of interest perhaps to mention briefly some of the qualities of very pure zinc, the purest sheet zinc available. This zinc contains considerably less than 0.1 per cent of impurities. The cost of such metal is, of course, so high that it would be impractical to use it for commercial galvanizing purposes, even in a small way.

A sheet of this metal was found to be soft and ductile. It could be easily bent back and forth without showing any signs of splitting or cracking at the bend. It was very difficult to dissolve this metal in acid as compared with dissolving ordinary samples from slab zinc suitable for galvanizing. Our photomicrograph of this pure rolled sheet zinc shows that the grains are very fine, having been mashed and broken in the rolling process. No other metals or impurities can be seen, even under the microscope.

To discover what would happen from galvanizing with pure zinc, experiments were made with one of the very best quality commercial slab zincs, as shown by the analyses of two samples below:

	Sample 1, Per Cent	Sample 2, Per Cent
Zinc	99.25	99.46
Lead	0.80	0.52
Iron	0.02	0.02

This was very pure zinc, although it contained considerable lead. Before any metallic additions were made, a large number of sheets were galvanized and very good spangles were produced on them. This shows that spangles can be obtained without the addition of aluminum or making other metallic additions to the bath. No additions were made to the bath for three days, and sheets were galvanized to discover what would happen under these conditions. In the photomicrograph of this slab zinc the large size of the zinc crystals shows that the metal was cast and not rolled. No impurities can be seen in the metal, although at a much higher magnification they would perhaps become visible.

After three or four days' operation the zinc began to show evidences of contamination with iron. It was noticed that a scum of zinc oxide was formed much more quickly over the surface of the bath. During the first day's operation the bath surface stayed bright and mirror-like, and when the sheets were drawn through it they were bright and had a good spangle on them.

Surface Oxidation Causes Trouble

In a couple of days, however, the surface became dusty, looking, dull, and it was no longer possible to skim a bright mirror-like surface. As fast as the skimmer was drawn over the top the surface closed behind it, leaving a dusty, yellow surface through which to draw the sheet. Thus it is seen that, when no metallic additions are made to the bath, the surface quickly oxidizes after a few days of operation. It is also clear that spangles can be obtained by simply using zinc with no metallic additions, but for only a short period of time.

Hannah and Rhead* state that "pure zinc alone is incapable of producing a spangle." The zinc used here contained small amounts of lead and iron and may possibly have had a large enough quantity to develop a spangle. All metals have a skin and show surface tension, much the same as the skin on the surface of water. Pure zinc is no exception. The mechanism of the formation of the spangle seems to be that this skin breaks up into pieces on the surface of the galvanized iron, leaving some places bright and others dull. Thus pure zinc should give what is ordinarily known as a spangle.

But, from a practical standpoint, pure zinc will not give

*"Crystallization Effects on Galvanized Iron," by J. Dickson Hannah and E. L. Rhead. *Journal of the Institute of Metals*, Vol. XXX (1923), page 93.

a spangle, for pure zinc quickly becomes contaminated with small amounts of iron. Also, the surface of the metal oxidizes quickly, producing a dull, powdered luster, which prevents the formation of the spangle. What really happens is that the metallic skin which produces the spangle is gone, and in its place are the very fine particles of non-metallic oxide. Therefore no spangle can form, because the material to form it is no longer there. It may be perhaps physically possible to obtain a spangle with pure zinc, but it is not possible from a practical standpoint, because the zinc cannot long be kept pure under practical conditions.

Why Lead Rarely Gives Trouble

Lead does not seem to be harmful in zinc, for two reasons: First, it alloys with zinc only in very small amounts; second, any excess lead over the amount that will alloy with the zinc settles to the bottom of the pot, and is entirely harmless from a galvanizing standpoint unless it becomes too deep. If lead were lighter than zinc, and thus came to the surface of the bath, it would quickly oxidize at zinging temperatures, and perhaps be harmful.

TOP Surface of a Slab of Commercial Zinc High in Iron Content. This kind of metal is apt to be brittle and to decrease the resistance of the coating against corrosion

Hannah and Rhead added a considerable quantity of lead (sufficient to saturate the zinc and leave an excess) to molten pure zinc. They state: "It was found that a spangled coating could be produced readily, and that there was an optimum temperature for the production of spangle grains of maximum size. This temperature was found to lie about 30 deg. C. above the melting point of zinc. It cannot be absolutely fixed at a definite value for articles of varying mass, owing to the impossibility of deciding upon the average size of the spangle grains on a sheet, with sufficient definiteness."

They state that the addition of lead or bismuth facilitates the production of the spangle, but in the discussion

of their paper John Welding said that he had never found it necessary to add lead to the galvanizing bath.

It was also interesting to note what J. Garland, Cossipore, India, had to say in regard to lead in the zinc bath. He was interested to note the conclusion that the presence of lead was necessary to the production of the spangle. He found that on pails dipped at a temperature of 890 deg.

PHOTOMICROGRAPH of Very Pure Commercial Slab Zinc Used for Galvanizing Purposes. This is not so pure a metal as that shown in the other view on this page, but it is thoroughly satisfactory to use and is financially practicable

Fahr. the spangle was most pronounced, and he had come to the conclusion that the dipping temperature was the chief factor for its production. But since reading the authors' paper, he had looked up the analyses reports of the zinc used in his work, and found that it contained 1.9 per cent lead.

Discussions of other authorities on galvanizing have shown that, from the practical standpoint, lead has not been found to be harmful in zinc. The objections to large quantities of lead from a practical angle have been due to price, and to the fact that it settles to the bottom of the kettle. This raises the dross up into a level at which the articles galvanized must pass through it, thereby keeping the dross stirred up and producing a very inferior, low-quality coating. It is not uncommon in practice to have to dip out excess lead when this happens.

Difficulties Caused by Iron

Iron, the third impurity found in zinc for hot zinking purposes, is by far the most important. The limit set for iron by the American Society for Testing Materials is 0.08 per cent. Most of the practical galvanizer's troubles come from iron in the zinc. Hence some explanation is necessary to account for the difference between this very low percentage in the metal, as bought, and the high percentages of iron found both in the molten zinc bath and in the galvanized coatings.

Iron, although specified low in the standards, at times may be high in slab zinc. This was found to be true by most galvanizers during the war period, and for a few years after the war. At present, however, most of the slab zinc on the market meets the requirements of the standard set for metal for this purpose. But it is only a matter of good business policy to check up all the slab zinc when it is received.

Physical appearance and chemical analyses will quickly show the quality of the metal. These facts are best illus-

trated by an example of a large shipment of slab zinc that did not meet the standard. This metal was prime Western zinc, and not remelt zinc. It is not to be inferred, however, that most of the slab zinc on the market today is of low quality, because exactly the opposite is true; most of it is well within the limits set as a standard.

Deleterious Metal Easily Detected

The purpose of this illustration is to show how a high iron content affects both the physical and chemical qualities of slab zinc, and how it may be detected. All slab zinc should be analyzed according to the method given by the American Society for Testing Materials as a standard for sampling and analyzing slab zinc.

After doing this and finding the zinc not up to standard, it was decided to check the results by some additional samples and analyses. Our third illustration shows the top surface of one of the slabs of metal. The metal was not all like this, and the strange part of it was that other slabs, without this crystallization, were even higher in iron content. That the iron had segregated to the middle in this slab is shown by the analyses of two samples from this crystallized area.

	Per Cent Iron
Sample 1.....	0.238
Sample 2.....	0.255
Average	0.246

Attention was then turned to the better looking area of the slab, which appeared to be composed of purer metal. Samples from these areas showed the following results:

	Per Cent Iron
Sample 1.....	0.0952
Sample 2.....	0.0535
Sample 3.....	0.0714
Sample 4.....	0.0416
Average	0.0654

Thus it can be stated definitely that the chemical composition of the zinc does affect its physical appearance and fracture, for the average of the two samples drilled in

PHOTOMICROGRAPH of Pure Rolled Sheet Zinc Containing Less Than 0.1 Per Cent of All Other Metals. This material is too expensive to be used for commercial galvanizing

the poor-looking area was 0.246 per cent iron content, as compared with 0.0654 per cent iron content for the clear crystalline area. This difference in the appearance of the fracture of the slab through these two areas was easily detected, also. Iron in zinc has the tendency to give the metal a brass-yellow color and to give the grain a fine, sandy ap-

pearance. Pure metal has a bluish luster and large, bright crystals. Zinc high in iron is very brittle; pure metal is somewhat ductile.

Other slabs were drilled and the average of all showed high iron content. It was found after going over many slabs that, first, the physical appearance is affected by the chemical composition of the zinc; second, the most highly contaminated part of the metal is found toward the center of the slab; third, iron gives the zinc a fine, sandy fracture and a light brass-yellow discoloration; fourth, pure metal is highly crystalline and has a bluish luster, and the surface of the slab is smooth and clean.

With a good, high-quality prime Western zinc, it takes from two to three weeks to saturate the metal with iron so that dross will settle out. If the kettle is overheated this will occur, of course, much sooner. Iron tends to make the coating brittle and to decrease its resistance to corrosion.

Cadmium is found in some zincs and has not found favor, especially from the sheet galvanizers. It tends to produce very fine, small spangles, which in themselves are not attractive.

Aluminum has been put in the zinc bath for some time and is very desirable when the bath is open—that is, not entirely covered with molten sal-ammoniac flux. It tends to give the coating a bright appearance, and keeps down excessive oxidation of the zinc. It is very desirable in obtaining a good spangle.

Tin, also, has been used for some time by the sheet galvanizing industry, and it is the tin that develops the large spangle on sheets.

Antimony often finds its way into the zinc bath, due to the charging of scrap metal into the galvanizing pots. It tends to make the coating brittle and will cause considerable trouble by giving a yellow discoloration on the sheet, if put in in too large amounts.

Cooperative Investigations on Die Castings

High Melting Brasses, Aluminum-Base Alloys, and Low Melting Zinc-Base Castings Studied in England

B RITISH die casting industry (according to speakers before the Institute of Metals, Liverpool, Sept. 5) suffered a serious setback as the result of bad work a generation ago, and buyers are still skeptical about its ability to furnish castings of uniformly high quality. In view of the resulting stagnant condition, leading firms organized a research into certain phases of the technical situation, and some of the results attained during the past four years were presented before the meeting mentioned. Representatives of the industry present at the meeting freely acknowledged that a considerable improvement in practice had resulted from these investigations.

High-Speed Steel Dies Favored

Although the question of metals for dies was not intensively studied, much discussion centered on this matter. Suitability of various steels for molds and cores when casting copper-rich alloys were investigated by agitating samples in the melted alloy for one to three hours. Marked differences in attack were noted. High-carbon steel and heat-resisting steels were little corroded, but soft and mild steel were rapidly attacked. Chromium plated steel resisted attack excellently, but the plating tended to flake off as a result of alternate heating and cooling. No comparative figures were given for cast iron, from which permanent molds are frequently made in England. Some heat-resisting irons have been investigated by the Cast Iron Research Association and had successfully been used for severe service. From the discussion it appeared that high-speed steel is favored for dies for the industry, although it was noted that one steel from one source might act very differently from a similar steel from another manufacturer. Another speaker emphasized the important part played by the die designer and tool maker; the commercial success of more than one firm depended upon the development of a staff of such highly-skilled specialists.

A more extensive investigation was made into the properties of aluminum-base castings, made in permanent molds without pressure. Castings studied were

4 per cent copper
8 per cent copper
12 per cent silicon
4 per cent copper, 3 per cent silicon
"Y alloy" (Cu: Ni: Mg 4: 2: 1½)
"L-5" (Cu: Zn 3: 13)

Satisfactory results were obtained in both test bars and tubular flanged forms except for the first two mentioned. Hot shortness was thought to be responsible. In a supplementary investigation the impact strength of these alloys was found to be unimpaired at temperatures up to within 45 degrees of commencement of melting. Shrinkage cavities in some castings were controlled by close regulation of the mold temperature, although it was admitted that a change in mold design might have had a similar effect. One of the speakers asserted that tensile strengths reported for the 12-per cent silicon alloy were at least 2000 lb. below what he would regard as good works practice. Dr. Rosenhain said this occurred rarely; nearly always the complaint is that the laboratory can get better results with refined control.

Sixteen zinc-base alloys, having copper and tin, or copper and aluminum (plus further additions of nickel, cadmium, lead or magnesium), were studied in the form of test pieces made in pressure machines operated by hand. It was found that porosity depends almost entirely on the kind of pull given the lever, although this effect is minimized with wide gates. In sound test pieces the tensile strength is little affected by reasonable changes in casting conditions. Such castings were tested after accelerated aging (exposure to hot moist air or steam). It was found that chemical variations in the compositions studied had insignificant effect on rate of growth as compared with the form and mechanical condition of the casting itself. From a practical standpoint, a manufacturer of these low melting alloys declared that the casting temperature, temperature of mold, size of gate and vent, and type of pull, were all important variables, but they depended on the size and character of the casting. It is axiomatic that the metal should be at as low a temperature as could be conveniently worked, and that the mold should be cool enough to promote ready solidification, yet warm enough to allow the whole of the metal to get in before it began to solidify. In view of the complicated form of die castings, no standardized gate could be adopted. The type of pull of the lever operating the plunger is doubtless important, and varies with the skill of the workman. It is being found that the more viscous alloys of zinc-aluminum-copper could be cast in the same conditions as the pressure die castings in aluminum and aluminum alloys most successfully.

Gear Blanks with Minimum Waste

New Method Places Toughest Part of Bar
Where Teeth Will Be Cut, Thus
to Promote Strength

BY C. A. MCGRODER

UNIFORMITY of grain structure where it is most needed and a minimized waste of material are the outstanding improvements effected by a new method of manufacturing bevel ring gear blanks, as developed and perfected in the forge department of Dodge Brothers Corporation, Detroit. Using 4½-in. chrome-vanadium steel bar stock, this new process, through a novel heading operation, turns the outside surface of the bar out and away from its center, until it lies at right angles to the original bar. This places the best of the metal, that portion of it which has been most refined in the rolling process, on the face of

the ring blank, where the teeth will be cut. It also leaves the grain of the steel running in the general direction in which the teeth will be cut, straight out from the center of the ring, thus rendering the gear-cutting operation easier.

Earlier methods failed to produce uniformity of grain direction and structure and wasted a much higher percentage of the material in scrap. Most commonly used of these is a plan of piercing a hole in the center of a short section of round bar stock, after it has been flattened out to the required thickness and diameter. This leaves the

Under the Gravity Drop Hammer, or Board Hammer, at Right, Below, the Rough Ring or "Doughnut" Produced by the Horizontal Heading Machine Receives Several Blows Which Shape It into the Ring Gear Blank, with Slight Flashings on Both Inside and Outside. The crank-action trimming press at its left removes the flashings, after which the blank receives another blow or two under the drop hammer to insure accuracy of dimensions

Into This Heading Machine (Above) with 6-In. Capacity Are Fed Bars of 4½-In. Stock, 12 Ft. Long. The dies are in two positions, the first of which presses far into the heart, forcing the outside surface or "skin" of the bar to lie back in a circular flange, approaching the shape and dimensions of the rough blank or "doughnut." The next position brings the shaping of the "doughnut" nearer completion and shears it from the bar, leaving the new bar end with a deep impression in its center, which is the beginning of the next "doughnut"

At Right at Top Is the End of a 12-Ft. Bar After the Heading Machine Has Completed Its First Operation, Pushing into the Center of the Bar and Forcing the Outside Surface to Form One Side of the Circular Flange. This shows the side of the ring blank which will be composed largely of metal from the center of the bar. The metal from the bar surface forms the other side of the ring, where the gear is eventually cut. In the center is the remainder of the bar after the partly formed blank has been sheared off by the heading machine's second operation, leaving a depression in the center of the bar which is to be the hole in the next "doughnut." At left is the end of a bar worked down too short for the jaws of the heading machine. These rough ends are just large enough to be flattened out or "pancaked," to have the center punched out and to be made into two ring blanks by the process formerly employed

Four Stages in the Production of the Ring Blank After It Leaves the Horizontal Heading Machine. At the left is the rough "doughnut"—the partly formed gear blank turned out by the heading machine. Next is the same "doughnut" after it has received several blows from the drop hammer and still bears the flashings, which are to be removed by the trimming hammer. The two irregular circles are the flashings removed by the trimming press. The ring at right is the completed blank, ready for machining

better surface metal on the outside of the ring. In consequence the teeth are tougher near the outside diameter than they are at their narrower ends, on the inside diameter.

Another widely used method is to bend a piece of flat bar stock, which has been rolled to approximately the required shape, into a circle and then weld the ends together. Two shortcomings of this method are that the grain of the metal in the completed ring blank lies almost at right angles to the teeth that will be cut in it, and the characteristics of the metal (both chemical and structural) at the welding point differ widely from those prevailing elsewhere in the blank. Both of these conditions render more difficult the gear-cutting operation. A third method is to split a "buttonhole" lengthwise in a piece of round bar stock and then enlarge the opening until it approximates a circle. But this leaves, at opposite sides of the ring, two sections where the grain is irregular.

In the present method 12-ft. bars of $4\frac{1}{2}$ -in. round chrome-vanadium steel are used, containing 0.17 to 0.20 per cent carbon, 0.15 to 0.20 per cent vanadium and 1 per cent chromium. These are heated in an oil-fired furnace and fed into a 6-in. National heading machine, which is driven by a 75-hp., three-phase motor. Tests have shown that the unusually large flywheel with which this heading machine is equipped enables it to deliver momentarily over 300 hp. when the maximum pressure is developed in the upsetting operation.

Two operations are provided for by the dies of the heading machine—the first, upsetting; the second, shearing. The upsetting die punches into the center of the bar and mushrooms the stock out into a tulip-shaped, circular flange, with the more highly refined metal from the surface of the bar on its inside face, where the teeth of the gear will be cut. An air lift raises the bar from the first to the second position and the second operation shears the rough ring or "doughnut" from the bar, leaving a deep depression in the center of the bar, which is to become the hole in the next gear blank.

Etched Sections Showing Just the End of a Bar Going Through the Heading Machine. At left is the bar after the first blow from the heading die, which has punched into the center of the bar, forcing the surface metal out into a circular flange approaching the shape and size of the completed gear blank. This places the more highly refined metal from the bar surface on the face of the blank, where the teeth will be cut. At right the same bar has received the second blow from the heading machine, which helps to shape the ring blank and shears it from the bar

Etched Sections of Completed Ring Gears. The illustration at left shows the chief advantage of the new method. Here the grain of the metal lies in the best possible direction, straight out from the center of the ring, with the more highly refined metal from the surface of the bar in the teeth of the gear, where strain and wear are greatest. At the right the more highly refined metal from the surface of the bar can be clearly seen on the side away from the teeth. The "doughnut" used in this piece was intentionally placed face downward in the drop hammer, for experimental purposes

After being reheated in another oil-fired furnace the "doughnut" receives several blows under a 3000-lb. gravity drop hammer, or board hammer, which shapes it into the

required dimensions of the ring gear blank, leaving only slight flashings on the inside and outside peripheries of the ring. While still hot the blank is placed in a crank-action trimming press, which removes the flashings. The trimmed blank is returned to the drop hammer, where it receives another blow or two under the forming dies to insure accuracy of shape and dimensions. So accurate are the dies of the heading machine, the drop hammer and the trimming press that the flashings removed by the press from a single blank weigh only 28 oz. This is practically all of the metal wasted in scrap by this new method, a remarkably small proportion.

Operators on the heading machine, which produces an average of 200 rough blanks an hour, find it possible to feed about 10 ft. of the 12-ft. bar into the machine while the regular gripping dies are in operation. The remaining short ends are allowed to accumulate until there is a large enough quantity on hand to make it worth while to fit up the machine with special dies adapted to gripping these short pieces.

But even with these special dies the heading machine is incapable of using up the bar to the end. A short length is left over, containing about enough metal for two more blanks. This is sawed into two pieces, which are flattened out under a drop hammer until they are about the thickness and diameter of the "doughnut" produced in the heading machine. A hole is punched in the center of each piece, which then is put under the drop hammer and trimming press, where it receives the same treatment given the "doughnuts" produced by the heading machine. The two small pieces punched from the center of these blanks add slightly to the amount of material wasted in scrap from each bar, but the waste for each ring gear produced is still much lower than that from any method of production previously used.

Aluminum Productive Capacity Rapidly Expanding

SUCH data as are available seem to convince a writer in "Mineral Industry, 1927," that world production of aluminum is steadily increasing, and is now in excess of 200,000 metric tons annually. The writer goes on to speculate just how far this increase is to go, and what the results will be. Fifteen years ago France and the United States produced almost all of the world's supply of bauxite, but since that time extensive deposits of high-grade bauxite have been developed in half a dozen different countries, and the production is now trebled, with the new producing areas furnishing over half the output. There has also been a corresponding increase in smelting capacity; the enormous new Canadian plant of the Aluminum Co. of America at Arvida, Quebec, went into production in 1926, and exports from Canada to the United States increased to 23,170 net tons in 1927 from 11,240 the year previous.

The most significant recent move in the world's market was the organization during 1926 of the Aluminum Cartel, which includes the principal European producers, thus dividing the field between the two forces, the cartel on the one hand, and the Aluminum Co. of America on the other hand, each controlling about one-half the world's producing capacity of metal.

These three factors—plentiful supply of bauxite, extension of smelting capacity and organized competition—may result in a marked increase in production and a corresponding lowering of prices. On the other hand, many users, particularly in the automobile industry, have been substituting steels of high strength and low corrodibility for aluminum at lower cost and with little increase in weight.

Figuring back from the value of new aluminum produced in the United States (Bureau of Mines figure of \$39,266,000) and the average price of 25.4c. per lb., "Mineral Industry" says that 1927 production amounted to something over 150,000,000 lb. The plant at Massena, N. Y., contributed about half the production, the remainder coming from Niagara Falls, N. Y., Alcoa, Tenn., and Badin, N. C. Imports totaled 68,389,641 lb., while 16,051,477 lb. of ingot, plate and tube were exported.

The five aluminum plants operating in Norway have a rated capacity of about 26,000 metric tons of metal annually; the production in 1926 was 24,429 tons. In addition, two other plants, each of 10,000 tons capacity, are under construction, and the 7000-ton plant of the Norsk Aluminum Co. (controlled by the Aluminum Co. of America) is to be enlarged to 11,000 tons; this will bring the total capacity of Norway to about 50,000 tons annually.

Experiments with high-pressure steam locomotives have been hampered by the necessity for using turbines to generate the power with expensive intermediate gearing between turbine and driving axles. Nevertheless there has been in operation in Europe for over a year a "Schmidt-Henschel" locomotive generating steam at 1400 lb. per sq. in. in a tubular boiler, and delivering it at 900 lb. to the prime mover. The tubes are of nickel steel; distilled water is used for make up, and the engine has run about 30,000 miles without tube troubles. Another high-pressure locomotive of different design is also running on the Swiss railroads.

Electric Normalizing and Annealing

Eight Furnaces Handle Alloy Steels at Various Heating Cycles—Large Pit Furnaces a Feature—Air Blast for Cooling

ONE result of efforts by the Timken Roller Bearing Co., Canton, Ohio, to settle annealing questions raised by its production of alloy steels has been the installation of a bank of electric annealing furnaces that, individually and collectively, present several features.

The problem of utilizing electric heat in this particular case was complicated by a number of factors. Of these one of the most outstanding was the volume of production demanded. Another was that several different types of steel were made, each of which required a special annealing cycle and subsequent course of treatment. In fact, some of the factors involved threatened to make the general use of electric heat impractical, in spite of manifest advantages.

The difficulties were overcome, however, and a group of eight furnaces has been installed; they form a total connected load of 3600 kw. Two more are projected for installation in the near future that will increase the total to 5450 kw. As the furnaces have all been specially designed for their particular work, an individual description of the different types may be of interest.

Pit Furnaces for Slow Cooling

Probably the most remarkable of the group, in point of size and novelty of design, are the two 850-kw. pit annealing furnaces. These furnaces were specially built for annealing high-carbon chrome steel, or any other steel where the annealing cycle calls for a slow cooling. The long

cycles required have, hitherto, been a decided obstacle to the use of electric heat for annealing such steels on anything approaching a quantity basis. In a well-insulated furnace the cooling time was usually so long that production was seriously delayed. In the case of these particular furnaces, this difficulty has been overcome by the introduction of a novel feature in the furnace construction.

Each furnace is 9 ft. wide and 21 ft. long inside, with a loading depth of 6½ ft., and accommodates charges of bar or tube stock of weights up to 50 tons. The covers are separately framed structures, weighing about 25 tons each, fitting in sand seals around the top of the pit. They are handled off and on the furnaces by a special electric traveling gantry crane running on tracks at the floor level on each side of the furnaces.

The heating elements are of the T-grid type, and are mounted on the side walls and bottom of the pit. They are divided electrically into two circuits, one including the side wall elements and the other those in the bottom. Each circuit is provided with individual control which gives two sets of connections, one a 440-volt, three-phase Y for high starting input, and the other, 440-volt single-phase series for soaking heat. The first has a power demand of 425 kw. for each circuit, or 850 kw. total, and the latter 142 kw. for each, or 284 kw. total. The charge is stacked in cradles, and loaded as shown in one of the illustrations, which also shows the method of mounting the resistors and the method of protecting them from damage during charging or discharging by means of heavy heat-resisting alloy guides.

Air Blast Accelerates Cooling

The operation of the furnace is briefly as follows: The material is brought up to annealing temperature (1450 deg. Fahr.) as rapidly as possible, at which point the circuit

Two 850-Kw. Pit Type Furnaces (Right) Used for Long-Time Annealing of High-Carbon Chrome Steel. Interior of the furnace and method of protecting heating units are shown above

The 700-Kw. Pusher Type Normalizing Furnace with Tubes Being Pushed Upon the Run-Out Table

is cut over from the Y connection to series, and the temperature is held long enough to insure uniform heating. The charge is then slowly cooled through its critical range, the process being carefully regulated to insure the exact metallurgical results desired.

After the critical range is passed, cooling is accelerated by means of an air blast system, which consists of a series of pipes built into the furnace through which cooling air is forced by means of two 20-hp. motor-driven high-pressure centrifugal blowers. It is this forced cooling system that has rendered long time annealing practical on a commercial basis in these furnaces. It has eliminated the possibility of exposing the charge to the air before it has cooled sufficiently, and, at the same time, it removes the objectionable feature of too long a cooling period. The total annealing time from charge to charge is just about cut in half by the use of forced cooling. A third 850-kw. pit furnace of the same general construction and operating principle, will be installed shortly.

Chrome Steel Normalized in Special Furnace

All high-carbon chrome steel is, before annealing in the pit furnaces, normalized in a 700-kw. pusher type nor-

malizing furnace. This is also used to normalize certain low-carbon steels, and for processing steels that have to meet cold shear tests. It is 12 ft. wide and 21 ft. long inside, and is capable of handling bars up to 5 in. square and 20 ft. long, or tubes of corresponding dimensions. It is equipped with three pusher mechanisms, two being located at the charging end and one at the side. The latter was developed to push the charge across the width of the furnace interior from the charge to the discharge side. It consists of five rails crossing the furnace interior at equal intervals, and terminating on the discharge side in a large trough which delivers to a flight conveyor for returning the carrier shoes to the transverse pusher.

The actual pushing is done by a number of shoes, or baulks, in each trough, which are pushed across by the rods of the pusher mechanism proper. The charge rests on these shoes, and is carried across the furnace by the movement of the shoes in the trough. When the shoes come to the discharge side they are delivered to the conveyor and returned to the loading side for use. The pusher mechanism is so designed that the motor circuit is tripped at the completion of one revolution of the cams, so that the distance of movement is limited. The other pushers are of

Side Pusher Mechanism of the Normalizing Furnace That Shoves the Charge from the Charging to the Delivery Side. The conveyor which carries the shoes under the furnace for re-insertion can be seen in the right center

the rod type, and serve to push the charge in and out of the furnace, respectively.

The T-grid heating elements are mounted partly on the furnace roof, and partly in transverse wells located between the piers which support the cross pusher shoe troughs. Electrically, the heating elements are divided into four separate circuits, each with individual control.

The operation of the furnace is quite simple. The stock to be normalized is pushed in by a motor-driven pusher. By virtue of the electric connections that have been adopted, it is subjected to a high initial heat on entering, the degree of which is lowered as it moves across the furnace. Arrived at the finishing, or delivery side, the work is pushed out of the furnace onto a run-out table which is equipped with manipulators, which deliver it to a motor-driven cooling bed. From the bed it is delivered directly to the cradles in which it is to be loaded into the pit annealing furnaces.

The controls for all the motor-driven operations, including the side pusher, are located on the charging side so that the furnace can be operated by one man. Some idea

have been grouped into three zones, two door zones, and a central or main zone. As to the mounting, part of the grids are mounted on the roof and part underneath the hearth, so as to produce a uniform distribution of temperature in the furnace interior, with a consequent even heating of the charge.

Two small circular pit furnaces have been installed for treating rod in coils. They are rated 100 kw. each and are separately supplied from 440/125 volt, single-phase transformers. They can be seen in an accompanying picture just to the right of the hearth type furnace just described.

Two Car Type Furnaces for Bar Stock

Miscellaneous bar stock, especially that which does not require annealing cycles of over 24-hr. duration, or which can be discharged into the open air at high temperatures, is annealed in two car type furnaces. One of them, a 315-kw. furnace, was built by William Swindell & Brothers, Pittsburgh. The inside dimensions are 22 ft. long, 6 ft. 4 in. wide and 5½ ft. high. The car dimensions are 20 ft. long, 6 ft.

Normalizing Furnace from the Charging Side, Showing the Charging and Discharging Pusher Rods, and Their Control

of the method of control can be obtained from one of the illustrations. The capacity of the furnace is about 150,000 lb. of stock per day, with a power consumption of about 200 kwhr. per ton. An additional furnace for normalizing work will be installed later in the year. It will be rated at 1000 kw.

Normalizing Small Lots

Heat treatment of bar or tube stock of various alloy steels is accomplished in a 300-kw. hearth type furnace. This furnace is also used for the normalizing of small lots of steel which it is impractical, for one reason or another, to handle in the large unit. The furnace is of the double end type, being about 20 by 6 by 4 ft. inside. The stock to be annealed is charged in at one door by a motor-driven pusher and, after it has been uniformly heated, pushed out of the other onto a receiving table. This table is tilted by another motor-driven mechanism, and the stock dumped into an oil-filled quenching tank. It is removed from the tank by a motor-driven conveyor.

In order to compensate for any local cooling that may take place at the ends near the doors, the heating elements

wide and about 3 ft. high. The normal rating of the furnace is 20,000 lb. per charge, but the car will carry a load of twice that, if necessary.

The heating elements are mounted on the roof and side walls of the furnace proper, and on the car bottom. The latter is divided into 13 wells, by firebrick piers built up from the car bed. The elements are mounted in these wells, and the whole covered with interlocked alloy sheets that form the hearth. The elements are directly connected to the 440-volt, 3-phase supply circuit, two connections being available, 3-phase delta for high initial heat, and 3-phase Y for holding or soaking heat. Automatic temperature control is obtained by means of a Leeds & Northrup potentiometer type single point controller recorder. The average economy is 355 kwhr. per ton.

The car is moved in and out of the furnace by a motor-driven rack and pinion mechanism. Connection for the elements on the car body is made by a bushing and coupling located at one side of the door. A very elaborate system of sand seals has been adopted to prevent uneven temperatures in the furnace interior due to the leakage of air from the

The 300-Kw. Hearth Type Furnace Used for Heat Treating Bar or Tube Stock. The two 100-kw. circular pit coil furnaces can be seen in the right background

outside. The door is provided with a seal at both top and bottom, and there is a seal on each side of the car, which engages with a knife edge on the furnace wall. The furnace is also equipped with vertical cooling ports in the side wall, by which the rate of cooling can be accelerated if desired.

The second car type furnace, furnished by the General Electric Co., differs considerably in its design and construction. The inside working dimensions are 28 ft. long, $4\frac{1}{2}$ ft. wide and $2\frac{1}{2}$ ft. high, the overall sizes being $34 \times 9\frac{1}{2} \times 16$ ft. The car proper is 33 ft. long, $5\frac{1}{2}$ ft. wide and has an overall height of $5\frac{3}{4}$ ft. It is equipped with a cradle which raises the charge above the lower level of the heating elements on the side wall.

The heating elements are all mounted on the side walls, there being none on the roof or on the car. They are divided into two zones, each with separate control. The design of the elements proper is such that extra heat is provided near the door to compensate for door losses. Their location

on the walls brings the lower ends below the level of the charge on the car, so that heat may be radiated up through the charge. The furnace is supplied with power at 220 volts, each zone forming a separate circuit. Two connections are available for each circuit delta for high heat and a Y for soaking heat. The power consumption of the first is 230 kw. per zone, or 460 kw. total, and that of the other 153 kw. per zone, or a total of 306 kw. The furnace has a normal capacity of 10 tons but, like the other car type furnace, it has 100 per cent overload capacity. On a maximum heating cycle of 9 hr., the power consumption averages about the same as that of the other furnace.

High temperature insulation is the subject of a 20-page treatise prepared for distribution by Celite Products Co., Los Angeles, containing information whereby the loss of heat through various kinds of walls may be computed, and upon which an economical insulated design may be based.

Discuss Machine Tool User Problems

Lubrication, Hardness of Metals to Be Cut, Tooling Service,
Fabricated Frames and Productive Capacity

WAYS and means of bettering machine shop practice and of meeting problems which confront the user of machine tools were discussed at the second annual meeting of the Machine Shop Practice Division of the American Society of Mechanical Engineers, at the Hotel Sinton, Cincinnati, Sept. 24 to 27. To the symposiums on aeronautic machine shop problems, on lubrication and on the use and application of machine tools in modern manufacturing methods were contributed seven papers by men

selected as eminently qualified to speak on these subjects. A delightful trip on the Ohio River steamer Cincinnati to Ashland, Ky., to inspect the continuous sheet mill of the American Rolling Mill Co., constituted a novel departure from the routine procedure of most conventions. Three of the technical sessions were held on board the Cincinnati and one at the Hotel Sinton. About 275 members and guests registered at the meeting, and of this number 225 made the journey to Ashland.

Theory and Practice of Bearing Lubrication

FROM the standpoint of arousing controversial comment the paper by Forrest E. Cardullo, chief engineer G. A. Gray Co., Cincinnati, presenting "A Theory of the Lubrication of Cylindrical Bearings," was outstanding. After building up his theory, Mr. Cardullo deduced from it certain general considerations regarding the design and operation of bearings. Assuming, as seems reasonable, that the minimum film thickness is the most important of the factors which determine whether or not a bearing will operate successfully, he arrived at the conclusions embodied in the following general rules:

1. The load-carrying capacity of a bearing is proportional to its diameter.
2. The load-carrying capacity is proportional to the operating viscosity of the lubricant, that is, to the viscosity of the lubricant at the temperature which the lubricating film attains in operation.
3. The load-carrying capacity is proportional to the speed of rotation in revolutions per minute.
4. The load-carrying capacity is proportional to the surface speed of the journal, since this is proportional to the product of the diameter and the speed in revolutions per minute.
5. The load-carrying capacity of a bearing is a function of its length: For very short bearings, such as eccentric straps, it is proportional to the cube of the length. For very long bearings, it is proportional to the length. For bearings of the usual proportions, the load-carrying capacity is proportional to some power of the length greater than the first and less than the third.
6. The power loss in a bearing is proportional to the square of the diameter.
7. The power loss is proportional to the length.
8. The power loss is proportional to the square of the speed in revolutions per minute.
9. The power loss is proportional to the square of the surface speed of the journal.
10. The power loss is inversely proportional to the operating clearance.
11. The power loss is proportional to the operating viscosity of the lubricant.

These rules, said Mr. Cardullo, lead directly to the following conclusions regarding the ultimate rise in temperature of a bearing operating continuously: The rise in temperature of a bearing is independent of its length; is proportional to its diameter; is proportional to the operating viscosity of the lubricant; is proportional to the square of the number of revolutions per minute; and is inversely proportional to the running clearance.

Mr. Cardullo pointed out that these rules assume certain conditions which never are realized in practice—that the

box and the journal are both truly round and perfectly smooth, that they are rigid and maintain their shape, and that their axes are parallel and are not affected by deflections produced by the load. In fact, the rules formulated are indicative merely of the general trend of the behavior of bearings.

Lubrication Grooves in Bearings

In a paper on "Grooving Bearings in Machines," G. B. Karelitz, research engineer Westinghouse Electric & Mfg. Co., East Pittsburgh, said that a large number of machine bearing troubles would be eliminated and wear would be decreased were more attention paid to the fundamentals of lubrication during the design of machines. Viscosity alone cannot be relied upon as a test for a good lubricant. Its oiliness is just as important, as this property greatly decreases friction between the surfaces in contact. Furthermore, the oiliness apparently determines the ability of the lubricant to adhere to the rubbing surfaces, which is essential for maintaining an efficient load-carrying oil film.

The mechanical design of a bearing must be developed with the importance of fluid lubrication kept always in mind, Mr. Karelitz declared. The lubricant must be fed into the bearing at a point where the pressure of the oil is low or even preferably where a vacuum is expected, as on the "up-side" of a sleeve bearing. It is important to leave uninterrupted the bearing zone, where the load-carrying oil film is formed.

Indiscriminate cutting of grooves in a bearing may be harmful. The function of grooves is primarily to distribute oil from the source of supply over the complete length of the bearing. Wherever possible, they must be confined to the unloaded portion of the bearing; the loaded part should be left free from interruptions. It appears that an angle of about 45 deg. to 60 deg. must be had between the line of oil admission and the load line to allow building up an efficient load-carrying oil film.

While an essential feature of fluid lubrication is a continuous rotation of the journal in the bearing at a comparatively high speed, unfortunately in many instances this condition is not fulfilled, said Mr. Karelitz.

How Railroads Use Their Machine Tools

LARGE sums of money are spent annually by railroads in making changes in machine tools and in shop surroundings, to keep up with the increased areas and weights of parts to be machined and maintained, said L. A. North, shop superintendent Illinois Central Railroad, Chicago, in a paper dealing with "Machine Tools—Their Use and Application in the Railroad Industry." He declared that the number of parts to the locomotive, as well as weights, are increasing

constantly. This fact makes it necessary to establish new methods and higher production to maintain costs at a satisfactory level. In this direction many shop kinks have been developed by officers and by shopmen, while machine tool builders also have made valuable suggestions. Mr. North emphasized that the "man factor" is an important consideration. If the workman can be induced to realize the necessity for proposed changes, and to become interested in

future betterments, his efforts will enter largely into the further advancement of this undertaking.

Explaining the attitude of the railroad toward introduction of new tools and new methods, Mr. North observed that the "field for external and internal grinding has been developed to some extent. Many parts formerly turned, planed or slotted are now finished in a far shorter time by grinding. Metal is saved, which in itself adds to the life of the part being machined." Piston rods, air reverse cylinders, air fire-door opener cylinders, grate-shaker cylinders, stoker engines, crank pins and driving axles are among the parts which are being ground, instead of being machined by some other less efficient and less satisfactory method.

Mr. North pointed out that "some thought has been given to tire grinding, also some experimental work has been done on reducing flat spots on car wheels. Unless a very small amount of metal were to be removed, tire grinding would not interest railroad management, as grinding on the flange would slow up this operation compared with machine turning and would destroy any saving that otherwise would be effected." Grinding of locomotive cylinders and of piston-valve bushings would furnish a smoother surface than the present method. Increasingly, grinding will be used for future operations, as machines are designed for that purpose.

Milling machines are taking a prominent part in railroad shop practice, according to Mr. North. Further develop-

ment of millers can be brought about and production can be increased and cheapened by a closer study of machine-work needs, the tool builder keeping in mind the introduction of harder and tougher metals employed in locomotive construction. In regard to drilling operations, there is slight use for the full radial. Such angle drilling as is necessary can be done either on the semi-radial drill or on vertical drill presses with tilting tables. When multiple-spindle drills are utilized, they should be fitted with a simple and suitable chuck for rapidly clamping and securing parts to be machined.

Special chucking features and forming tools used in conjunction with high-speed tools and specially designed heavy-duty machines have reduced machining time, have enabled railroad shops to keep pace with the increased areas and parts to be machined, and have relieved the fatigue of the operator and added to his personal comfort.

In turning bar stock from which cap screws, hex-head machine bolts, studs and other parts are made, Mr. North said that close study is required, to avoid spending money for waste material, which otherwise would be saved in labor if this operation were used. The time reduction by means of a special chucking feature has been substantial on this one class of work, the saving probably running as high as 10 per cent. Lapping and honing are of interest to railroad machine shops only in regard to machining airbrake parts.

Tractor and Implement Makers' Use of Machine Tools

MANY machine tool builders unfortunately think that their customers do not understand how to use machine tools effectively and that the ideas of the customers are untenable if in contradiction to the broad experience of the machine tool manufacturer, said Max Sklovsky, chief engineer Deere & Co., Moline, Ill., in discussing "Machine Tools in the Implement and Tractor Industries." Undoubtedly many users of machine tools are ignorant of many of the problems in the design of the equipment; nevertheless, machine tool makers would profit by taking note of the actual experience of machine tool users.

Machine tools used in the manufacture of implements today represent an investment of \$200 per employee, while other production machinery averages \$2,500 per employee. On the other hand, the unit machine tool investment in the tractor industry is about \$1,500, or seven and one-half times as great as in the implement industry, whereas other production machinery is approximately \$1,000 per employee. These figures, according to Mr. Sklovsky, justify the statement that the present-day tractor is largely a machine shop product.

The tendency is to apply machine tools to a greater degree in the manufacture of implements, because machined steel parts are being substituted for castings and cut gears for cast gears, while ball and roller bearings have become necessary, to provide increased resistance to wear. All of these changes call for more careful machining. Precision of manufacture applies not only to the tractor, but also to the implement. Machine tool manufacturers, therefore, can look forward to the greater use of machine tools by implement builders. However, implements require forging ma-

chines rather than machine tools, and machine tool builders cannot expect to find as large a market in the implement industry as in the tractor industry.

Greater Ruggedness Now Required

Protection of wearing parts, principally the various bearings, and their proper lubrication are two factors essential in good machine tools today, declared Mr. Sklovsky, who further stated that machine tools must be built not only for rapid production, but also with rigidity and strength far beyond the standards of a decade ago. Interchangeability of wearing parts is more desirable than their repair, and on this account ball or roller bearings properly adapted are preferable to solid bearings.

Rigidity of machinery where chiseling tools are used is universally recognized as essential, but many designers have overlooked one element of rigidity—that of the joints. Parts of machine tools are most generally designed with sufficient rigidity, but the fastening of these by means of bolts or studs is usually insufficient. Therefore, declared Mr. Sklovsky, "look to your joints" would be a valuable slogan for machine tool designers.

Chatter is the most serious drawback in obtaining proper results from machine tools, he said. Any such detriment inherent in the construction can be and should be overcome by machine tool builders. When this defect is eliminated, users can readily look to the design of their own product and parts, and to the condition of the materials used therein, for the elimination of further difficulties with machining operations.

Standard Machines with Special Fixtures Give Flexibility

"MOST of the equipment which we install must be suited for general conditions, and yet be adapted to high production," said J. R. Weaver, superintendent Manufacturing Equipment Department, Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa., who took as his topic "Some Practices in the Use of Machine Tools in the Electrical Industry." He declared that work in the electrical business is so diversified that standard machines with special holding fixtures are used extensively. Another way to attain reduction of costs has been to arrange several machines in sequence in charge of one operator.

While the Westinghouse company believes that fixtures should be designed and built by the manufacturer of the machine tool, and installed on it during its process of con-

struction, such practice has been inconvenient because it delays delivery of the machine. However, in building its own fixtures, the company endeavors to take advantage of machine tool builders' experience.

Choosing the Tool for a Given Job

Mr. Weaver expressed the opinion that "on some work, especially on form surfaces, planing is much more economical than milling, for the reason that we can maintain our form and size with the least expenditure. However, on flat surfacing, especially where there are a lot of pads to be finished, the milling machine is better adapted than the planer. We do considerable surface grinding on castings, and we find this to be a very economical way of finishing

surfaces, providing there is not more than $\frac{1}{4}$ in. of metal allowed for the finish."

Since all manufacturers are reducing as far as possible the amount of finish on their castings and forgings, Mr. Weaver said, it looks as though, if this trend continues, some time in the future the equipment will be of lighter construction, of high speed and easily handled, depending on the development of cutting tools. It is hard to predict just how much improvement can be obtained from redesigning machine tool equipment, but it appears as though manufacturers have gone as far as possible, so that users must turn in other directions rather than to machine tools to realize further savings in production costs.

Suggests Fabricated Machine Frames

Mr. Weaver said that his company has gone extensively into welded fabricated steel construction work on its apparatus, and suggested that it might be possible, to some extent at least, to apply the same construction to machine tools. He explained that the company has gone into this construction on jigs and fixtures and has reduced costs and

has advanced deliveries about three weeks on each jig. He mentioned the fact that Westinghouse has been experimenting with some special alloy steel on which cutting speeds and certain other operations have been increased as much as 250 per cent, with good results. This special alloy steel, combined with fabricated steel construction, would mean that machine tools ought to be built for and run at a much higher speed than at present.

The company's experience in applying chromium plating to cutting tools shows that, on cutting materials other than metals, the process has been successful; but, when cutting steel and cast iron, the plating chips off at the cutting edge.

For handling alloys of aluminum, copper, brass and zinc, Mr. Weaver's company has set up three processes: 1. Die casting, by which castings are made from zinc-base alloys and aluminum. 2. Permanent molding, by which castings are made from iron aluminum bronze, or aluminum alloy. 3. Hot pressing, which is used on castings or forgings designed from forged brass or copper. The utilization of these processes has aided substantially in reducing, as well as in some cases entirely eliminating, machining.

Production Per Man-Hour Dominates in Automobile Plants

SPEAKING for the automobile industry, L. L. Roberts, mechanical superintendent Packard Motor Car Co., Detroit, in a paper read in the author's absence by H. K. Parsons, Cincinnati Milling Machine Co., Cincinnati, declared that "production per man per hour is of more importance in the selection of a machine than floor space, but economy in the use of floor space is desirable. A machine of compact design has many advantages over one with projecting arms, brackets and levers, which make the latter type difficult to place in a progressive lineup as well as liable to damage in transportation."

Individual motor drives are preferred to belt drives, although the former are more expensive and cost probably as much to maintain. However, the individual motor drive shows a saving in power consumption, presents a clean-cut appearance and lends itself readily to the installation of conveyor chutes, etc., for the transportation of parts in process. Hopper feeds are desirable and should be installed wherever the design of the part will allow their use without too many complications in the design of the hopper feed mechanism.

Extensive Repairs Not Favored

It is not the policy of the Packard Motor Car Co. to repair machines where the cost of repairing is over half of the purchase price of a new machine. Extensive repairs are made only when the machine is of a special type and therefore would have a small resale value, and where the purchase of new equipment would show no substantial saving.

Answering the question of what actuates the purchase of new equipment, other than for purposes of expansion, Mr. Roberts replied that "it has been the general policy of the Packard Motor Car Co. to purchase any single machine or battery of machines which, when all the factors involved in the manufacturing costs are computed, shows that it will pay for itself within a reasonable length of time through its greater efficiency."

The speaker said that too much stress cannot be laid on the importance of proper tooling in regard to cutting tools, holding jigs and fixtures. The cutting tool set-ups should be made so as to allow for quick removal from the machine. The piping installation carrying the coolant to the cutters should be made to be readily detached or moved, to facilitate its adjustment and replacement. Holding fixtures should be so designed as to make it possible to clear chips from their locating and clamping points with the smallest amount of time loss, after the removal of the part being machined.

Who Should Provide the Tooling?

With regard to the problem of whether a prospective machine tool user should purchase a machine with complete tooling, or should buy only the machine and tool it up with the aid of his own tool engineers, Mr. Roberts explained that his company's practice has been to have machinery builders

submit complete proposals covering the tooling and the methods by which the operations are to be performed. Advice is usually given in advance by the company as to the general requirements of production, quality of finish, tolerances, previous operations performed and the locating points to be used.

Certain parts difficult to clamp without springing under the cut, on account of the nature of their design, have been considered more suitable for machining on a surface grinder than on a milling machine. Such parts as stamped crankcase gear covers, side wheel carrier brackets, exhaust and inlet manifolds, rear axle cases, motor inlet and outlet water flanges and rocker lever housings have been economically machined on this type of grinder. Many parts were ground for one-half of the former cost of milling.

Radical departures are often made from long-accepted methods of machining motor parts on account of some machine tool improvement, said Mr. Roberts. "As an example: there are eight balance counterweights assembled on a Packard crankshaft. Three counterweights formerly were forged, machined on two flat sides and joint side by surface grinding, and then contour turned in a lathe to a radius approximately the same as the crankarm, with a special fixture holding eight of the parts. As 2000 of these parts were required daily, this method was quite costly and needed four grinders and two lathes. Two high-powered milling machines with hydraulic feeds are now used instead; one machine is for cutting the weights to length, 16 at a time, from rolled bar stock, and the other machine is for form milling the radius formerly turned in lathes. These two machines easily produce 2000 counterweights in a 9-hr. day."

Inspection on Aircraft Engines

In the manufacture of Wright aircraft engines, inspection is of paramount importance, said Hugh W. Roughley, quality manager Wright Aeronautical Corporation, Paterson, N. J., in a paper on "Inspection Methods and Quality Control in the Manufacture of Aircraft-Engines Parts," which was read by L. C. Morrow. From the time the raw material enters the factory until the finished engine is finally tested and packed for shipment, all materials and every operation are subjected to the exacting scrutiny of a large force of specialists.

Commenting on Mr. Roughley's paper, R. E. Flanders, manager Jones & Lamson Machine Co., Springfield, Vt., observed that the large number of alloy steels going into Wright motors is of interest. In fact, the wide range of materials may be partly responsible for the improvements in airplanes. If so, it is an indication that standardization of materials should not be carried too far.

Tool Makers Must Guard Supremacy

That one-half of the machine tools bought by his company do not give the accuracy assured by their guarantee

was the statement of J. E. Padgett, Spicer Mfg. Co., Toledo, Ohio, in the discussion which closed the final technical session. He stressed the point that few machine tool salesmen know their own product as they should.

Progress in European Machine Tools

Engineers in European countries are profiting by the things being done in an industrial way by the United States, declared Fred A. Geier, president Cincinnati Milling Machine Co., in a short, informal talk. Mr. Geier, who has just returned from Europe, said that there is still need for more careful planning and designing of machines in this country. He emphasized that Americans should abandon the idea of

the supremacy and invulnerability of their machine designs. At the recent British machine tool exposition he noted evidences of considerable improvement in British tools.

R. E. Flanders, manager Jones & Lamson Machine Co., Springfield, Vt.; L. C. Morrow, managing editor *American Machinist* and chairman of the Machine Shop Practice Division, A.S.M.E.; and Walter W. Tangeman, sales manager Cincinnati Milling Machine Co., presided at the technical sessions. The local committee on arrangements consisted of Mr. Tangeman, chairman, E. F. DuBrul, F. E. Cardullo, Solomon Einstein, E. A. Muller, C. Luhn, A. Pletz and C. Fox. Visits to Cincinnati metal-working plants formed part of the program for those present.

Interactions Between Steel and Slag

Cooperative Program at Pittsburgh Uses Special Furnaces and Crucibles to Determine Best Steel Making Conditions

TO prosecute the five-year research into steel making problems jointly undertaken by the United States Bureau of Mines, Carnegie Institute of Technology, and a group of 29 steel companies (described in *THE IRON AGE*, Oct. 27, 1927, page 1171), the bureau's electric furnace laboratory was moved from Seattle, Wash., to the Pittsburgh station. It contains a 50-kva. Ajax-Northrup high-frequency furnace, shown in the accompanying view, capable of melting 125 lb. of metal. A 35-kva. furnace of similar design is used for making smaller melts, particularly for making up synthetic slags. Most of the ingots for the studies on deoxidation are made in a 250-lb. Moore 'Lectromelt furnace, and there are other smaller furnaces used for special work.

One of the most troublesome details found during the experimental work is the preparation of crucibles to withstand the various slags at high temperatures. For basic slags, crucibles made of fused magnesia bonded with hydrochloric acid have been most successfully used. Small fused magnesia crucibles with no bonding material have been made by firing in graphite in the small induction furnace. A melt of pure iron, saturated with iron oxide and

covered with a pure iron oxide slag, showed only 3 per cent MgO in the slag after holding four hours in such a crucible at 1550 to 1700 deg. C. Silica crucibles are used for acid slags, but it has been found well nigh impossible to prevent erosion of the crucible with acid slags high in iron oxide. Graphite crucibles are used whenever a reducing type of slag is being made and when the carbon content of the metal is not required to be low; graphite is also used in making up some of the synthetic slags.

The practical aspect of such slag studies may be inferred from the common saying among steel-makers that the way to make steel is to make good slags and let the steel take care of itself. A large portion of the research program is therefore centered on the properties of slags: how many impurities a slag will absorb from the steel in a given length of time; how fast does iron oxide, the agent for the removal of carbon, manganese, phosphorus, silicon, and other impurities from the metal, dissolve in the metal from a given type of slag; what changes occur in other physical properties with changes in slag composition. These are some of the questions which are being answered in this Bureau of Mines research work.

The Metallurgical Laboratory at Pittsburgh for Investigating Steel Making Problems Contains Besides the 50-Kva. Electric Furnace Here Shown, Several Other Furnaces, Including One for Studying Deoxidation

Chromium Steel for Railroad Rails

High-Manganese and Bessemer Steel Rails Also Defended
by Metallurgists—Low Alloy Gives Prolonged
Life Under Heavy Traffic

IN 1913 some heats of acid Bessemer steel containing 1 per cent chromium were made at the Stocksbridge Works (near Sheffield, England) of Samuel Fox & Co., Ltd., rolled into 100-lb. rails, fabricated into eight complete crossings and installed at important junctions on the London, Midland & Scottish Railway. Results were so satisfactory that supplies of the same analysis have been continued, but since 1921 the steel has been made in the acid open-hearth. In describing this material before the May meeting of the British Iron and Steel Institute, Thomas Swinden and P. H. Johnson quote a report by the division engineer for the railroad system as follows:

"One crossing was laid at the departure end of a station where speed was restricted to 30 miles per hour. The line is in a cut through a deep bed of clay and drainage is difficult. This crossing gave a better life than one of 0.55 per cent carbon Bessemer steel, but the increase was not considered altogether satisfactory.

"Another, laid at the entrance to a very busy station, is exceeding the most sanguine expectations, the life of the high-carbon Bessemer steel crossing being two and one-half years, whereas the chromium crossing has already had a life of 13½ years and is not yet worn out.

"Another crossing at the same station on the departure lines had a life of six and one-quarter years, against two years of the 0.55 per cent carbon steel. This particular crossing was considered the most important on account of heavy traffic, and its life is conclusive evidence of the efficiency of this class of steel.

"A further crossing has had a life of 12¼ years, while the remainder of that particular junction has been replaced a second time during that period.

"A trailing crossing in the main line where trains are passing regularly at a speed of 70 miles per hour is wearing so well that the decrease in depth per annum can be attained only by using the vernier caliper."

In addition to these data on actual wear, Messrs. Swinden and Johnson give the following comparative data:

	Bessemer Chromium Steel, Per Cent	Open-Hearth Chromium Steel, Per Cent	Basic Open-Hearth Carbon Steel, Per Cent
Chemical Analysis			
Carbon	0.50	0.50	0.55
Manganese	0.85	0.80	0.85
Silicon	0.20	0.23	0.15
Sulphur	0.04	0.03	0.03
Phosphorus	0.05	0.04	0.03
Chromium	1.00	0.95	...
Tensile Properties			
Ultimate strength.....	133,000 lb.	137,000 lb.	114,000 lb.
Elongation, per cent....	9.3 in 3 in.	13.3 in 3 in.	16.7 in 3 in.
Reduction in area.....	13.9%	38.0%	25.6%
1-ton Falling Weight			
After third 12-ft. drop..	3.3 in.	4.0 in.	5.0 in.
Not broken at.....	90 ft.-tons	72-ft.-tons	...
Brinell hardness.....	...	270	215

It was found that the chromium steel rails as rolled were capable of being drilled without difficulty and would not air-harden after heating for bending. The ingots rolled well, and were hot-sawn, cold-straightened and milled without difficulty. The extreme toughness under the falling tup (weight 1 gross ton, striking nose 5-in. radius, bearings 4 ft.

3 in. apart) and the high tensile strength indicated that the material was quite suitable for track work, despite the deficient elongation and reduction in area of the early Bessemer heats.

The microstructure of the rail as rolled is a dense mixture of sorbite and very fine pearlite, with a fine broken network of ferrite. The structure at the surface is somewhat finer grained. After a reheating to 950 deg. C. and air-blast cooling, about the only change is that the amount of free ferrite is materially reduced. Such heat treatment increases the hardness only 20 Brinell units, and also materially improves all the tensile properties of the Bessemer steel.

Higher Carbon Reduces Impact Resistance

Carbon should be limited to 0.55 per cent or less, in the opinion of the authors. Such steel is unbroken after successive blows of a 1-ton tup totaling 83 ft.-tons and causing a deflection of 7 in. Raising the carbon to 0.61 per cent gives a harder and stronger rail, but the ductility drops. Such a rail will break on the fifth blow of such a schedule: 7 ft. drop, 20 ft., 20 ft., 12 ft., and 12 ft., a total of 71 ft.-tons.

From such results as the above the authors have concluded that the problem of a more durable rail would be better solved by an increase in alloy content, particularly manganese and chromium, rather than by heat treating a plain carbon rail, or by increasing the carbon content and at the same time limiting the manganese (which is the trend in British specifications).

Discussion of the paper naturally brought in the comparative value of the Sandberg process of heat treating rails. J. H. Whiteley wondered whether chromium steel would develop the "gray spot" sometimes seen after sorbitizing by the Sandberg process. In a broken section, this minute gray spot indicated an internal burst caused by rapid cooling. He felt it was closely allied to the internal fractures frequently found in American high-carbon rails even after normal cooling on the hot bed.

John Millar, engineer of the London & North Eastern Railway, said that road had used switch points and frogs made from steel very similar to that described, except that the chromium was 0.71 per cent. These were installed in very heavy electrified service and the switch points, for instance, gave 2½ years of life as compared to 11 months for ordinary steel. Frogs and crossings lasted twice as long as carbon steel. In all, his company had worn out 250 tons of the chromium steel in special trackwork, and in no case had any flaw or fracture been discovered. Experimenting is now proceeding on a much larger scale; attention has recently been turned toward heat treatment after manufacture.

Manganese in Carbon Steel Could Safely Go to 1 Per Cent

D. Sillars said that, while many railroads insisted on the standard specification (0.55 to 0.65 per cent carbon, not over 0.8 per cent manganese) others did not, and his firm had commonly furnished tonnages of 1 per cent manganese rail and even a little higher. From a practical point, variable air-hardening, because of various rates of cooling on t

hot bed, caused trouble when manganese was above 1.2 or 1.3 per cent. Such rails would have to have special heat treatment. In his opinion, any steel, no matter how well made, would have "gray spots" in the fracture if a bulky portion were sufficiently rapidly cooled, since such occurrences are due to internal stresses. Chromium steels without nickel have a practical fabricating advantage because they are quite machineable, even when fairly high in chromium and having a high tensile strength.

One difficulty in depending upon manganese to give the necessary hardness in rails, in the opinion of the president of the institute, F. W. Harbord, was that this element would ordinarily be adjusted by a ladle addition, and consequently could not be controlled so accurately as the carbon in the bath. In his experience all alloy steels are distinctly sensitive to sudden changes in temperature, and consequently he felt that uniformity in final product could not be easily attained. For instance, a large tonnage of rails containing a

fractional percentage of chromium had to be normalized before it would pass the drop test.

One of the authors, P. H. Johnson, in reply, came to the defense of the Bessemer rail. He was in charge of rail inspection and testing for the Midland Railway from 1900 to 1920, and all rails laid during that period were of acid Bessemer steel. Statistics of the Board of Trade for that same period showed that the Midland had the smallest number of breakages of any railroad in Great Britain. Chemical specifications were as follows:

Carbon	From 0.40 to 0.50 per cent
Phosphorus	Not exceeding 0.07 per cent
Sulphur	Not exceeding 0.06 per cent
Manganese	1.10 per cent

The silicon was not mentioned.

A point worth noting is that test pieces from head and foot of these Bessemer rails showed very close to the same tensile properties. Basic open-hearth rails give a much greater variation—a matter he could not explain satisfactorily.

Principles of Steel Mill Lubrication

Friction, Which Absorbs Nearly Half of the Engine or Motor Power, Is Target of Lubricant

BY E. P. MALLISON*

CORRECT lubrication results from the complete and continuous separation of the rubbing surfaces of gears, pinions and bearings by an oil film of sufficient strength to resist the pressures, and with minimum fluid friction. There must be arrangements for a continuous supply, without waste, of clean, cool lubricant of the proper quality.

Increases in the size of ingots rolled, development of the high-speed motor-driven continuous mill and stiff competition in the steel market have increased the value of reliable lubrication, as well as operating economy. Higher costs of modern machinery make both replacement and shutdown exceedingly expensive.

Reliable tests of a reversing mill engine have shown that about 30 per cent of the power is used in deforming the steel, that is, in the actual rolling process. About 27 per cent is used in overcoming idle friction of the engine parts. Another 13 per cent is used in overcoming roll journal friction. About 9 per cent is used in overcoming pinion and spindle friction. The remaining 21 per cent is used in producing acceleration of the parts in reversing. From this analysis, friction absorbs 49 per cent of the total power and only 30 per cent shows up usefully in the product.

Anti-Friction Bearings a Great Help

Development of roller bearings capable of sustaining the great loads involved has materially reduced roll-neck power consumption. Recent tests on modern strip mills, oil lubricated and equipped with latest refinements, indicate a power requirement about half that used in older strip mills of corresponding sizes. On these continuous mills, the power required in overcoming the pinion, gear and spindle friction is 12 to 15 per cent of the total power.

Primarily, lubrication in a modern mill is applied by means of a circulating oiling system. The system includes a main supply line with branches to the various elements to be lubricated, a common return line to take the individual returns from each element, a suitable tank for receiving and cooling the return oil and separating from it

the water and heavy impurities, a means of cleaning and purifying the oil and storage capacity for clean oil.

Oil is applied to the gears under a pressure of 20 to 30 lb. to the square inch, by properly designed spray nozzles. The nozzles deliver the oil close to the pitch line, so that at the moment of contact the gear teeth are generously lubricated. Oil to the pinions is supplied at the top of the housing and cascaded into the engaging teeth by suitably arranged baffle plates.

Choice and Care of Lubricants

Selecting the proper lubricant is an important matter. It must possess enough body to establish on the working surfaces a film of sufficient strength to resist rupture from the pressures imposed. These pressures are most severe on the engaging teeth of pinions, because of the shock loads involved. The lubricant must be adaptable for use in a circulation system, involving the constant reuse of the same quantity of oil.

Natural enemies of lubrication are heat, air, water and solid impurities. Air and heat cause a certain amount of oxidation of the oil, forming some products that are soluble and others that are insoluble. Water combines with products of oil oxidation and other foreign impurities to form emulsions. The activity of these agents is overcome by using an oil of maximum chemical stability, by removing water and solids from it, and by reducing the soluble oxides. Cooling, cleaning and settling the oil further this corrective action.

An addition of 1,300,000 kw. to the electricity supply of the four States of Illinois, Wisconsin, Indiana and Michigan in the three years ended Dec. 31, 1927, is noted in a report of the power survey committee of the Great Lakes Division of the National Electric Light Association. This gives these four States a total energy supply of 4,556,000 kw. About 10 per cent comes from hydro-electric stations, and the remainder is steam-generated. The four States have nearly 17.5 per cent of the total supply of electrical energy in the United States.

*Vacuum Oil Co., New York. Abstract of a paper presented before the Philadelphia district section of the Association of Iron and Steel Electrical Engineers.

New 32-In. Stroke Draw-Cut Shaper

A 32-IN. high-duty draw-cut shaper, similar in design to its larger draw-cut machines, but incorporating a number of improvements, has been added to the line of the Morton Mfg. Co., Muskegon Heights, Mich.

The lower table and outer support is of new design. It is of angle bracket type and is considerably lower than the saddle, giving clearance of 31½ in. between the ram and lower table, which permits the finishing of large and bulky castings. The lower table has at its outer end an automatically adjusted outer support which is secured directly to the cross-rail of the machine. It is raised and lowered by screws of large diameter operating in independently adjustable nuts bolted to the extension base. Two vertical feed screws are used. The horizontal feed of the table is 32 in. and the vertical feed 16 in.

The ram, of high-carbon steel, is 6 x 6½ in. and has bearing surface on four sides. The clutches, reversing mechanism for operating the clutches and the stroke adjustment are the same as on the company's other draw-cut shapers. The feed is of automatic relieving type with large friction surfaces.

The machine is provided with power rapid traverse. Splash lubrication is employed for clutches and journals subject to heavy cutting strain. The

The Lower Table and Outer Support Are of New Design. It provides clearance of 31½ in. between the ram and lower table for bulky work

adjustable back bearing forms a stop against which work may be placed, this bearing being said to transfer the thrust of the cut directly against the column of the machine.

Equipment includes crane with ½-ton hoist of two-speed type, a steel

head, a swivel vise with 14-in. opening, and a 28 x 32-in. T-slotted top plate. The machine will accommodate shell planing, shoe and wedge and rod brass attachments for railroad work. It can be furnished either for belt or motor drive.

Chassis Frame Assembly Press

THE chassis frame assembly press illustrated is offered by the Hanna Engineering Works, 1765 Elston Avenue, Chicago, as an important adjunct to a chassis frame riveting installation when one or more tubular

cross members must be pressed into the horns or outriggers which have been previously riveted to the side bar channel webs.

The press rams open wide to permit quick loading of the frame parts.

The Press Rams Open Wide to Permit Loading of the Frame Parts. They advance rapidly to the work and stop automatically when the side bar channels are spaced properly

The rams act in unison, advancing rapidly until they engage the side bar channel, when the speed is reduced automatically and stopping automatically, when the side bar channels are properly spaced. Standard drill heads with automatic feed engagement, reverse and quick return, are used for drilling the holes for the rivets which dowel the tubular cross members in place. The machine is self-contained, with motor drive, limit switch controls, drilling coolant pump and sump, and pump for lubricating the moving parts.

Simplified Practice in Many Items

Simplified practice recommendations have been issued by the United States Bureau of Standards for steel barrels and drums, die-head chasers, metal lath, roofing ternes and steel lockers. Copies of these recommendations may be obtained at 5c. each from the Superintendent of Documents, Government Printing Office, Washington.

Each of the papers gives the history of the project with which it is concerned, and gives in tabular form the accepted standards that have been adopted by the various committees and have been accepted by 80 per cent or more, in each case, of the productive capacity of the country.

Gear Hobbing Machines for Helical, Herringbone, Spur and Other Gears

THE Newark Gear Cutting Machine Co., 69 Prospect Street, Newark, N. J., has added a new hobbing machine to its "Spirit of Production" line of gear cutting machinery. The machine is built in both plain and universal types and has capacity for hobbing gears up to 18 in. in diameter under the overarm that ties together the vertical stanchions. Without the overarm gears 24 in. in diameter can be cut.

The universal machine is intended primarily for helical, herringbone and spur gears and worm wheels. A distinguishing feature is an improved differential mechanism for hobbing helical and herringbone gears, which mechanism permits separate and easy control of the lead, feed and indexing trains of gearing, so that for a given helical angle and pitch only the number of teeth need be considered when changing over the machine. Any desired feed may be obtained and changed at any time without losing the helical path and without recalculating gear train ratios. The plain type machine, which is primarily for spur gears, spline shafts and worm wheels, does not require the differential mechanism, although it can be furnished as an extra.

Frame, stanchion, work-spindle and its housing, and the feed parts are the same in both types of machine. With the horizontal cutting principle long shafts and gears that are integral with their shafts may be handled conveniently. The work-spindle is bored $2\frac{1}{2}$ in. for this purpose.

in the center of the ring gear conveys the cutting compound and chips to a chip box in the frame of the machine. Provision is made for rapid traverse of the cutter carriage in both directions whether or not the hob is revolving.

Automatic lubrication is provided for the gear box mechanism. Speed change gears are driven by square shafts, and lead, feed and indexing gears by double-key shafts, the keys

being integral with the shafts. The master worm wheel is generated in place on its own bearings and the master worm is mounted in tapered roller bearings.

Extra equipment for special work can be furnished. The illustration shows a tangential attachment for generating worm wheels, with taper hobs, or star cutters or with fly tools when hobs are not available. The attachment functions rapidly and smoothly and may be applied to the machine conveniently by first removing the outer cap bearing of the cutter spindle. The rapid traverse mo-

An Improved Differential Mechanism Is a Feature of the Universal Type Hobbing Machine. The cutter spindle is located close to the frame ways to give increased rigidity

The cutter drive is arranged so that the cutter spindle is brought very close to the frame ways, which gives increased rigidity. Power is received from a splined side-shaft through a hardened and thread-ground worm mounted in Timken bearings, and is transmitted to a combined worm-wheel and bevel gear ring and then to a bevel gear ring mounted directly on the hob spindle. It is pointed out that three rotating gear members thus perform the function of two distinct pairs of gears. The ring gear also acts as a flywheel to steady the cutting action, and it is completely guarded and out of the way. A hole

Long Multiple Spline Shafts May Be Hobbed Automatically on the Attachment Shown Above. The tangential attachment, at the right, is for generating worm wheels with taper hobs or star cutters and fly tools

tion and differential mechanism function with this attachment. An attachment for automatically hobbing long multiple spline shafts can also be furnished, this attachment illustrated herewith. The regular cutter carriage is clamped to the frame ways when this attachment is in use, and the regular feed mechanism is disengaged. Shafts being splined are fed through the work spindle automatically.

The machine uses hobs up to $4\frac{1}{2}$ in. in diameter and 5 in. long, and has capacity for cutting teeth of 4 diametral pitch in steel at a fast rate,

and occasionally teeth of 3 d. p. Teeth of 3 d. p. can be cut in cast iron. Hob speeds range from 38 to 145 r.p.m. and feeds from 0.015 to 0.250

in. per revolution of the work. A 5-hp. motor is used. The net weight of the machine is approximately 6000 lb.

New 36-In. Rapid-Traversal Shaper

A NEW 36-in. rapid-traverse shaper designed to combine the speed and convenience of a small machine with the strength and power of a large shaper has been brought out by the Cincinnati Shaper Co., Cincinnati. The machine has a ram 6 ft. 4 in. long, with a bearing in the column of 3 ft. 10 in. It occupies floor space of

nient speed and cross-feed changes, automatic oiling, centralized control, improved "spring throwout" hand feed and quick-control indicators, which tell at a glance the feed, speed and length of stroke being used. A full length taper gib with single screw adjustment is provided. One wrench is used for all adjustments.

Power Rapid Traverse to the Table Is Provided. Lubrication is automatic

5 ft. 2 in. by 12 ft. 1 in. The strokes per minute range from 8 to 102 and the cross feeds, 11 in number, range from 0.010 to 0.170 in.

In addition to power rapid traverse to the table, features include conve-

The shaper is furnished either with single pulley belt drive or arranged for motor drive.

A universal table with a rocking top is available for use on the machine.

New General-Purpose Cutting Torch

THE Air Reduction Sales Co., 342 Madison Avenue, New York, is placing on the market a new general-purpose cutting torch with improved high-pressure valve, interchangeable trigger or lever control and replaceable valve seat. The torch is fitted with the new standard hose connections and is furnished with either 75 or 90-deg. angle head. The weight with tip is 3½ lb. and length, over all, 21 in.

The high and low-pressure oxygen tubes and the acetylene tube are of seamless brass, and are silver-soldered to the head and rear end. The valve

controlling the oxygen cutting jet is made accessible for examination or replacement by removing a screw cap directly above the trigger. The torch uses the range of tips from No. 1 to No. 8. Interchangeable tips for acetylene, hydrogen, city gas or other fuel gases, and choice of medium or low-pressure acetylene tips are available. Standard oxygen hose connection is for ¼-in., inside diameter, hose, and acetylene hose connection for 5/16-in. hose. The new cutting torch is furnished singly or as part of a complete outfit.

Oxygen and Acetylene Tubes of Seamless Brass, Silver Soldered to the Head and Rear End, Are Used

Non-Corrosive Sleeve for Pipe Ends

IT has been noticed that corrosive action in pipe lines is usually most severe at the ends, where threading operations have left the least metal to withstand it. This is thought to be the result possibly of eddy currents set up at joints. The two pipe lengths joined end to end seldom or never butt closely together; it results that the short space of increased diameter at the sleeve coupling acts as an expansion chamber, setting up a scouring agitation which also enhances corrosive action.

To avoid the waste of leaks at such

Pipe Saver Is a Tapered Sleeve Driven into Threaded End to Protect Against Internal Corrosion

joints, and the expensive replacement of leaky pipe lines, the Pipe-Saver Corporation of America, Carthage, N. Y., has placed on the market the "pipe-saver" illustrated. It consists of a sleeve of non-corrosive alloy to be driven into the reamed end of a threaded pipe. It has a slight lip at its end, flanged outward the thickness of the pipe wall. This holds the pipe-saver in place and also threads into the coupling. The device also has a taper calculated to assure tight fit, notwithstanding any slight variation in internal diameter of the pipe.

Massive Spot Welder

SPOT-WELDING of structural members or plates up to $\frac{1}{2}$ or $\frac{5}{8}$ in. thick may be done on Model 40-AV, designed by Thomson Electric Welding Co., Lynn, Mass. It is a rugged machine, designed for heavy clamping pressures and large trans-

turn is of such a size that the clamping pressure is 14,000 lb. Hose connections are for cooling water to the welding dies.

Control is simple. Current control for different thicknesses of material is obtained through a five-point regu-

Pushbutton Control for the Welding Circuit Makes for Ease in Operating

former capacity (250 kva.). The lower horn may be fixed in any one of three positions, giving a maximum opening of $10\frac{1}{2}$ in. The upper terminal is attached to the piston rod from a hydraulic cylinder and has a 3-in. stroke. As shown by the illustration, a $7\frac{1}{2}$ -hp. motor-driven oil-gear pump is mounted on the same foundation to the rear, capable of delivering a pressure of 1000 lb. per sq. in. to the upper cylinder, which in

lator switch mounted at the side of the welder and connected with tapped primary coils of the transformer. Operation of the welding circuit is controlled through a pushbutton switch mounted on the pressure control lever at front of the machine—this switch being connected with a magnetic contactor. A four-way manually controlled hydraulic valve for controlling the hydraulic system supply is mounted on top of the welder.

Tractor-Type Arc Welder for Lap and Butt Welds

AN automatic tractor-type arc welder utilizing the "electronic tornado" principle, outlined in THE

IRON AGE of June 28, page 1810, and used for making lap and butt welds on large tank bottoms and roofs, large

High Speeds and Uniform Welding of Tank Bottoms, Large Pipe and Other Work Are Claimed

pipe and on similar work, has been made available by the Lincoln Electric Co., Cleveland. High welding speeds, from 50 to 75 ft. per hr. on $\frac{1}{4}$ -in. lap joints and smooth and uniform welds are important claims.

The machine, illustrated herewith, consists of an electronic tornado head mounted on a self-propelled four-wheel-drive carriage. Power is supplied through a flexible cable and in using the machine it is only necessary to position it over the seam to be welded and to start the arc; the electrode and fibrous autogenizer are fed automatically as the tractor travels forward. In making lap welds additional filler metal is not required. It is stated that the heat of the carbon arc fuses the edge of the top plate to the lower plate, making a leak-proof joint. In making butt welds a filler strip is laid over the seam to be welded.

Management Meeting at Chicago, Nov. 13-15

The American Management Association, New York, will hold its autumn convention at the Palmer House, Chicago, Nov. 13 to 15. Preliminary plans call for a paper on the research activities of various companies by Dr. Z. C. Dickinson, professor of economics, University of Michigan, followed by discussions of the various types of research. One session of the meeting will be given over to the subject of compensation of executives and another to budgeting. Bryce Stewart, Industrial Relations Counselors, Inc., will speak on "The Financial Aspects of Pension Plans," and C. R. Dooley, manager personnel and training, Standard Oil Co. of New Jersey, on "Employment and Adjustment of Older Workers." The report of a committee on trends in industrial health practice will be presented by J. Walter Dietz, superintendent of industrial relations at the Kearny, N. J., plant of the Western Electric Co., Inc.

The third technical meeting of the Institute of Management will be held at the same place on Nov. 12 and the semi-annual conference of the association's office executive group on Nov. 16. W. J. Donald, 20 Vesey Street, New York, is managing director of the association.

Receivers Appointed for Eagan-Johnson Company

Upon application of the Bethlehem Steel Co., in friendly action, the United States District Court has appointed Daniel C. Eagan and the Pennsylvania Title & Trust Co., Chester, Pa., to act as co-receivers in equity and administer the affairs of the Eagan-Johnson Steel & Iron Co., Crum Lynne, Pa. Permission for the receivers to operate the company's plant has been granted by the court and interests identified with the company are actively developing plans for reorganization.

Business Analysis and Forecast

Large Business Volume to Be Expected

Movement of P-V Line Indicates Stable Conditions—
Automobile Industry Holds the Key
to Demand

BY DR. LEWIS H. HANEY

DIRECTOR, NEW YORK UNIVERSITY BUREAU OF BUSINESS RESEARCH

IN spite of pronounced activity, amounting to a boom, in the automobile business, and improvement in the copper and petroleum industry, business conditions continue very mixed, with no pronounced general upward trend. There has been a fair seasonal expansion and the average of industrial activity is about 8 per cent above normal, but the underlying general trend is only about sideways. This conforms to the forecasts made by the P-V line in recent months, during which time this barometer has held about horizontal.

The most important favorable factor is the large buying power shown by the average person, which is reflected in the high rate of automobile production and the good volume of retail sales. The general stability of commodity prices is also to be mentioned. The most important unfavorable factors are found in the money situation and in building activity. Excessive speculation on the stock exchange is also an unfavorable condition. The farm situation is neither very good nor very bad, as reduced prices of the chief cash crops are tend-

ing to offset increased yields. The whole situation is dangerously dependent on continued large volume in the automobile industry.

As to the future, it now seems reasonably certain that no large recession in business is possible this year. There is no great maladjustment in business, outside of finance, and even the financial situation pertains more to the stock market than to business. A severe liquidation in stocks would unquestionably affect business unfavorably for a time, but not deeply. In some respects business would be

Factors in the General Business Outlook

Favorable Factors

- (1) *The automobile business continues extraordinarily active.*
- (2) *Retail trade is in good volume.*
- (3) *Increased activity and earnings appear in the copper industry; the oil business shows improvement.*
- (4) *No important general maladjustments in industry now apparent.*
- (5) *Commodity price average firm and quite stable; scrap, pig iron and copper are higher.*
- (6) *Machine tool orders resumed rising trend in August.*
- (7) *Farm situation moderately good.*
- (8) *Most leading companies in strong financial position and have good earnings.*
- (9) *Mercantile inventories are light.*

Unfavorable Factors

- (1) *Sharp declines in building contracts and permits indicate approach of a downward movement.*

- (2) *Money is increasingly tight, with time money at $7\frac{1}{4}$ to $7\frac{1}{2}$ per cent, the highest in seven years; net demand deposits decline, while brokers' loans and commercial loans increase; member bank borrowings large.*
- (3) *Wild speculation continues on stock exchange, with no regard to fundamentals.*
- (4) *Some indications point to intrusion of speculative spirit in business (automobiles, copper, chain stores.)*
- (5) *Wheat and cotton prices are low.*
- (6) *Railroad freight traffic is relatively low—below the same period of the last two years.*
- (7) *Post office receipts declined in August.*
- (8) *August exports indicated a declining trend.*
- (9) *Business failures numerous; collections mostly poor.*
- (10) *Political situation uncertain.*

benefited. No reliable statistical barometers forecast a decline in general business.

But it seems equally certain that no large expansion is in sight. Too many unfavorable factors exist and conditions are too mixed to suggest much of an upward movement. It is difficult to see how a general advance can occur, with building activity on the decline and the investment market dulled by high money rates.

We conclude, therefore, that a practically stable level of business is in prospect. A relatively small seasonal expansion is likely to be shown by the September and October figures, and probably seasonal declines in basic industries will be considerable in November and December. Money

rates will continue high. Building activity will recede.

Large Business Volume Predicted

OUR chief barometer of general business, the P-V line, continues above normal and pursues a general sidewise trend. It rose slightly in July and August, though not sufficiently to indicate any considerable improvement in business conditions. The small upturn was due chiefly to a little rise in the level of commodity prices, while the physical volume of trade remained about the same. These conditions, we infer, indicate some improvement in the demand for commodities, in purchasing power or de-

sire to buy, or both. This barometer forecasts a fairly stable and large volume of business during the remainder of the year, with fair to good earnings for the average company.

Our adjusted index of steel production continues right in line with the barometer, and the slight gain in the latter tends to support the opinion that steel-making activities will at least show seasonal gains. No recession is yet indicated.

Exceptionally Heavy Automobile Output

THE second chart shows that the automobile boom continues, while new building contracts are on the decline. Final official figures show a

Sidewise Movement of P-V Line (Ratio of Commodity Prices to Physical Volume of Trade) Indicates Stable Business Conditions and Large Volume. Steel production (adjusted) continues high

Unfilled Orders Are Moving Narrowly About the Axis; Stock Prices, Though at a Much Higher Level, Are Irregular and Scrap Prices Are Considerably Better

Both Building Activity and Automobile Output Showed Continued Strength in August, Though the Former Dropped Considerably. Tapering off is to be expected

total of 489,800 passenger cars and trucks produced in the United States and Canada in August. The previous high was 474,500, in July, 1926. The August production compares with 416,400 the month before. It may truly be said that the automobile business has reached boom proportions. Never in the history of the country has there been such a volume of buying of new cars, chiefly in the lower priced groups. The production of Chevrolets has been enormous, and Ford output is steadily growing. It is now easily possible that automobile production in 1928 will exceed that of 1926.

When we allow for seasonal conditions, the gain is the more notable. Our adjusted curve of automobile output, shown in the chart, rises sharply to the highest point since December, 1925. On the adjusted basis, production was exceeded only in October, November and December of 1925, though July, 1926, was nearly as high. A seasonal decline is usually apparent in September and becomes more pronounced in the last quarter. Though current reports indicate that September production will be little below August, it seems reasonable to expect a considerable letdown thereafter.

As adjusted, the automobile production curve is near the peak reached in November, 1925. The question arises, are we not again near a peak? And just as automobile production slumped after November, 1926, will it not now fall off before long? We know of no way to forecast definitely, but an early peak and a subsequent decline seem probable. (1) Past performance in 1923 and 1925 indicate such results. (2) The automobile curve usually follows the building curve, and the latter has already turned down. (3) There is some limit to the number of cars that people can buy in any given short period, and movements like the present usually come in waves, with troughs following the crests. Allowing for the long-time trend of automobile production, the present rate is considerably above normal and a period of above-normal production cannot last indefinitely.

Apparently the people of this country are plunging on automobiles much as they are on stocks. Perhaps the paper profits they are piling up in the stock market have something to do with the matter.

But the building figures tell a different story. The volume of building contracts turned downward in August almost as sharply as automobile production rose. New contracts awarded, measured in floor space, amounted to only 78,873,000 sq. ft., against 82,125,000 sq. ft. in July, although the usual seasonal trend calls for an increase

of over 2 per cent. Our adjusted index, based on the average for 1921-1927 as 100, was 121.1, which compares with 129.5 in July and 130.6 in June. This represents the lowest annual rate since March. Coming just at the time when the effect of higher money rates should begin to be perceptible, the decline may be taken as marking the end of the upward trend in the building cycle, which began in June, 1927.

Moreover, the contemplated new construction as reported by the F. W. Dodge Corporation fell sharply in August to the lowest point since October, 1927. Our adjusted index for the month is only 111 per cent of the average for 1921-1925, in comparison with 122 per cent in July and 127 per cent a year ago. The figure is relatively low as compared with contracts actually awarded.

Finally, the building permits, covering the construction of residences, stores and office buildings in cities and towns, are estimated for August at \$275,000,000, against \$281,000,000 in July and over \$302,000,000 a year ago. In this case the adjusted index, allowing for seasonal conditions, is 110, against 118 in the preceding month and 140 in February, which was the peak of the year. (The average for 1921-1925 equals 100.)

Another significant fact is that the volume of long-term real estate bonds issued in August fell off sharply. In that month they amounted to only \$21,947,000, in comparison with \$48,495,000 in July and \$32,247,000 a year ago.

Of course, a large volume of actual construction is under way at present, for the contracts awarded during the last few months are now being carried out. In a few months, however, the actual construction will feel the effects of the reduction of new permits and contracts awarded.

Speculation in Steel Stocks and Scrap

STEEL stocks as a group, led by the United States Steel Corporation, pushed through to a new high in September. Some considered the movement in United States Steel common as a speculative maneuver designed to support the general market when it showed signs of going stale, while others regarded it as based on improved earnings prospects and a sign of fundamental strength. That purely speculative considerations played a part, however, is perhaps suggested by the belated character of the move. Unquestionably steel company earnings will show gains in the third quarter, with both volume of production and prices higher.

Steel scrap prices have moved quite

similarly to the average price of the steel stocks, and in September averaged higher than in any month since early 1927.

Unfilled orders of the Steel Corporation, however, showed little more than a merely seasonal gain in August, and the rate-of-change line in the chart is thus only about level with the base line, though this is an improvement over the preceding month.

We are unable to draw many inferences from these facts. Evidently speculation is active both in steel stocks and in steel scrap, while forward buying of steel is but moderate. Probably the fact that the very similar situation last September marked a peak in scrap and steel stock prices has some significance.

Output of Steel Barrels Continues High

Steel barrels produced in August are reported by the Department of Commerce at 677,313, representing 57.8 per cent of capacity of the 27 companies reporting. This is a gain of nearly 5 per cent from the 647,844 units made in July and, with the exception of May and June of this year, represents the largest monthly output ever made. It compares with 615,152 units in August, 1927.

For the first eight months of the year, the 1928 production has been 5,033,749 barrels, the largest ever recorded. It represents an increase of about 10 per cent from last year's 4,585,126 units, which was the previous high record. Shipments have held close to production, the difference in the first eight months, having been less than 5000 barrels in an output of more than 5,000,000.

Construction costs are higher than at any time since last December, according to statistics compiled by the Associated General Contractors of America. The rise is attributed to an increase in the average prices paid by contractors for the basic construction materials, particularly concrete aggregates and lumber. The average of wages paid in the construction industry remained unchanged during August.

Immigration for the fiscal year ended June 30, 1928, was 500,631, comprising 307,255 immigrants and 193,376 non-immigrants, according to the Bureau of Immigration. The 1928 figures reflected a decrease of 37,370, or 6.9 per cent, compared with 1927.

Schedule of the next instalments of the Business Analysis and Forecast, by Dr. Lewis H. Haney, Director New York University Bureau of Business Research, follows: Oct. 18—Position of Iron and Steel Producers; Nov. 1—Activity in Steel Consuming Industries.

Steel Corporation May Resume Ojibway Construction

TORONTO, ONT., Oct. 2.—The Essex County Council has agreed to a fixed assessment for the Canadian Steel Corporation, Ojibway, Ont., a subsidiary of the United States Steel Corporation. The assessment is to run for 10 years on the industrial property of the company. If the Ontario Legislature passes special legislation to legalize the agreement, the company is expected to proceed with the establishment of steel works at Ojibway.

Under the proposed agreement, assessment upon the industrial area is fixed at \$900,000 from 1929 to 1931, inclusive, conditional upon 500 bona fide employees being engaged at the works by the end of 1931. The assessment for the following three years is to be \$1,100,000, with the further condition that 800 men are engaged at the end of that period; and in 1934 the assessment goes to \$1,300,000 for the next three years.

The Canadian Steel Corporation has owned a large tract at Ojibway for more than 15 years. Several millions of dollars have already been invested in the plant and a blast furnace is partly erected, but so far no operations have been carried on there. There is also on the site a wire mill which is not yet ready for operation, though considerable equipment has been removed from Hamilton, Ont., to Ojibway.

Recent developments and arrangements with regard to assessment, etc., are taken to indicate that the steel company is preparing to finish at least a part of the proposed plant and start operations. Ward B. Perley is president of the Canadian Steel Corporation.

Increase in Imports of Pig Iron

Imports of pig iron in August are reported by the Department of Commerce at 12,990 tons. This is the largest total since April and is more than double the July movement of 6055 tons. More than half the imports came from British India, with the bulk of the remainder from the United Kingdom and the Netherlands.

Compared with last year, the imports of the first eight months show a gain of nearly 12 per cent. Shipments coming in from United Kingdom have been two and a half times

as great as last year, while those from Germany have almost disappeared. Details of the month, with comparisons, appear in the table.

Iron and Steel Institute Announces Program

At the thirty-fourth general meeting of the American Iron and Steel Institute, to be held at Hotel Commodore, New York, Oct. 26, the following technical program has been provided:

"An Acoustic Laboratory for the Testing of Music and Other Steel Wires," by W. B. White, acoustic engineer American Steel & Wire Co., Chicago.

"Uniformity, Continuity and Magnetic Testing," by A. V. deForest, research engineer American Chain Co., Bridgeport, Conn.

"Steel Requirements of the Aircraft Industry," by H. J. French, senior metallurgist Bureau of Standards, Washington.

"Recent Observations of Some European Iron and Steel Conditions," by C. A. Meissner, United States Steel Corporation, New York.

"The Present Status of Structural Steel Welding," by F. T. Llewellyn, president American Welding Society, New York.

"Steels Used by the Automotive Industry," by W. J. MacKenzie, vice-president Interstate Iron & Steel Co., Chicago.

The usual banquet will be held in the evening.

Pittsburgh Mill Ships by Water to Northwest

Included in a tow of nine barge loads of steel products of the Jones & Laughlin Steel Corporation, which left Pittsburgh Sept. 30, was one barge load of wire products, which will be turned over to the Federal Barge Line at Cairo, Ill., for delivery to Minneapolis, which is one of the ports of the upper Mississippi Barge Line at present being operated by the Federal Government. This marks the first all-water shipment of steel from Pittsburgh to the Northwest. It also marks another step by Pittsburgh mills in the efforts to expand their markets which had been limited by high railroad freight rates.

Steel Mail Cars Demanded in Proposed Bill

WASHINGTON, Oct. 2.—Representative M. Clyde Kelly of Pittsburgh has announced that he will reintroduce at the next session of Congress a bill which provides that after Jan. 1,

1930, all cars or parts of cars used for the railroad postoffice service shall be of steel construction, the style, etc., to be determined by the Postmaster-General. Railroad interests have opposed the bill which they claim, if enacted into law, would cost them ultimately \$60,000,000 together with the scrapping of \$30,000,000 of present equipment. They contend that the legislation is unnecessary because the railroads are already making headway for equipping their trains with safe mail cars. A companion bill to the Kelly measure was introduced in the Senate by Senator Dale of Vermont but was amended before being passed by that body. The latter bill was so amended that it would not apply to trains operated upon branch lines, independent short line railroads, narrow gage or electric railroads.

Russian Company in Berlin Handles Manganese Ore

HAMBURG, GERMANY, Sept. 15.—It is understood that the Manganerz Export Co., Berlin, has been established to handle exports of Russian manganese ores from the Caucasus. The company is owned by the Russian Government and, it is understood, replaces the organization formed by the Harriman interests, which recently relinquished their concessions in Georgia. The German firm of Rawack & Grünfeld, Berlin, controls exports of manganese ore from the Russian Nikopol mines, so that the entire exports of the Caucasus are now centralized in Berlin.

Germans Experiment with Sponge Iron Process

HAMBURG, GERMANY, Sept. 15.—The Eisenschwanngesellschaft G. m. b. H. has been established through a combination of the interests of the Vereinigte Stahlwerke A. G. and Friedrich Krupp A. G., for the purpose of producing sponge iron by the direct reduction process under the Swedish Norsk-Staal patents. It is understood that a plant with a capacity of 20,000 tons a year is planned for experimental purposes. If the process proves satisfactory, it will be introduced into a few departments of the Krupp and Vereinigte Stahlwerke plants.

All products formerly sold by the Waterbury Mfg. Co. and the U. T. Hungerford Brass & Copper Co. are now sold under the Chase name and mark, according to an announcement by F. S. Chase, president Chase Brass & Copper Co., Inc., Waterbury, Conn. Chase Brass & Copper Co. warehouses were established in 1921 in various cities and last year the Chase Companies, Inc., bought the assets of the U. T. Hungerford Brass & Copper Co., which also had brass and copper warehouses in a number of cities.

UNITED STATES IMPORTS OF PIG IRON BY COUNTRIES OF SHIPMENT

	August		Eight Months Ended August	
	1928	1927	1928	1927
United Kingdom	2,550		37,327	14,935
British India	7,495	9,703	34,269	37,900
Germany		560	95	8,371
Netherlands	1,333	2,422	17,673	19,468
Canada			378	689
France		1,000	300	1,500
Belgium		399	202	699

All others	791		3,684	1,218
	12,990	14,084	94,340	84,780

Hearings on Youngstown to Ohio River Railroad

WASHINGTON, Oct. 2.—Arguments were made on Thursday of last week before the Interstate Commerce Commission on the application of the Pittsburgh, Lisbon & Western Railroad for authority to construct two branch lines to connect the Youngstown district with the Ohio River.

Attorneys for the applicant contended that the new lines would move substantial tonnages which are not now moving, having reference to shipments of coal from western Pennsylvania to the Youngstown district and of steel from that district to Southern and Southwestern markets.

Attorneys for the railroads contested the claim, arguing that the only effect of the new lines would be to deprive the trunk carriers serving the Youngstown district of some of the tonnage they now carry. They also attacked the relationship between the Pittsburgh Coal Co. and the Pittsburgh, Lisbon & Western and Montour railroads, which the coal company owns. It was insisted by them that the fact that the Pittsburgh Coal Co. owns terminal facilities at Smith's Ferry, Pa., where one of the new branches would begin, raised a serious question as to whether there would be discrimination against other shippers. Attorneys for the applicant replied that instead of shippers being discriminated against they would likely get reduced prices on coal through the rail and river route and that the new line would benefit the public.

The report of the examiner who conducted the hearings in the case was favorable to the new construction.

Increased Imports of Iron Ore

August iron ore imports are reported by the Department of Commerce at 225,538 gross tons, compared with 183,256 tons in July and 188,892 tons in June. The August incoming movement was the greatest since February. It represented, however, a shrinkage of more than 25 per cent compared with August, 1927, when 303,586 tons came in.

Imports in the first eight months reached 1,677,206 tons, a reduction of about 11 per cent from last year's 1,879,180 tons to the same date. This reduction has been mainly at the expense of Sweden, where the mine

strike resulted in cutting off almost 90 per cent of what came in during the preceding year. There was an increase of 55,000 tons in imports from Chile, which have amounted this year to considerably more than half the total. Details of the month, compared with the preceding year and the eight months of the two years, are shown in the table.

Doehler Die Casting Co. Buys Equipment

The Doehler Die Casting Co., 386 Fourth Avenue, New York, has purchased from the Metal Mold Castings Co., Buffalo, its permanent mold casting equipment, dies, molds and other relative equipment which will be added to Doehler permanent mold department. The Metal Mold Castings Co. will discontinue its business.

Crumwold Furnace Sold

The Crumwold furnace at Emaus, Pa., owned by the Reading Iron Co., Reading, Pa., has been sold to the H. Sofransky Co., Allentown, Pa., and will probably be scrapped. The stack was built in 1872, rebuilt in 1909 and last relined in 1920. It had an annual capacity of 62,000 tons of foundry and forge pig iron and was last operated in 1920.

Lower Freight Rates on Scrap Recommended

WASHINGTON, Oct. 2.—Rates on scrap iron and steel, in carloads, from Newport News, Va., to certain destinations in Maryland, Delaware, New Jersey and eastern Pennsylvania would be reduced by 47c. to \$1.73 per gross ton and from Newport News, Norfolk, Portsmouth and Richmond, Va., by 72c. per gross ton if the Interstate Commerce Commission act favorably on recommendations made in a report proposed by Examiner T. Leo Haden, announced last Saturday.

The report covers two cases, one being that of the Newport News Shipbuilding & Dry Dock Co., Newport News, which complained against the rates from Newport News to Maryland, Delaware, New Jersey and eastern Pennsylvania consuming points.

The other complaint was made by the United Iron & Metal Co., Baltimore, against the rates from Newport News, Norfolk, Portsmouth and Richmond to Baltimore. In disposing of

the latter case the examiner recommended that the present rate of \$3.78 per gross ton be reduced to \$3.06 and that reparation be awarded to the complainants on that rate basis.

In the Newport News Shipbuilding cases involving rates from Newport News, which, generally, takes the same rates as Norfolk and Richmond, the examiner recommended the following reductions from Newport News.

To	(In Gross Tons)	Pres- ent Rate	Recom- mended Rate	Reduc- tion
Baltimore and Sparrows Point, Md.	3.78	\$3.06		72c.
New Castle, Claymont, Del.; Chester, Coatesville, Philadelphia, York, Modena, Pa.	3.78	3.31		47c.
Columbia, Phoenixville, Conshohocken, Birdsboro, Lebanon, Reading, Pa.	4.79	3.56	\$1.23	
Pencoyd, Pa.	4.28	3.56		72c.
Harrisburg, Steelton, Pa.	4.54	3.56		98c.
Bethlehem, Pa.	5.54	3.81		1.73
Roebing, N. J.	5.04	3.56		1.48
Burnham, Williamsport, Pa.	5.67	4.06		1.61

Republic to Weld Pipe Up to 7-In. Electrically

YOUNGSTOWN, Oct. 2.—Recent acquisition of Steel & Tubes, Inc., by the Republic Iron & Steel Co. has aroused much interest in pipe-making processes, and a moot topic is whether the ordinary method of furnace welding of pipe will eventually be supplanted by systems now employed by Steel & Tubes and the A. O. Smith Corporation, Milwaukee, which use electricity for the welding agency on plates and strips previously bent cold.

Control of the Johnson patents for making electrically welded pipe passed to the Republic company through its absorption of Steel & Tubes, Inc. The latter has been making pipe up to 4 in. in diameter of No. 11 gage steel, and now has a machine under construction which will make pipe of 7-in. diameter of No. 10 or No. 11 gage wall thickness.

Elmer T. McCleary, president Republic Iron & Steel Co., says that his company has not yet worked out the reorganization of Steel & Tubes, Inc., or plans for extending the application of the patents obtained in the purchase of that company.

The Youngstown Sheet & Tube Co. engineers have been working on a plan for introducing electric welding, and it is said that the details are on paper for attaching to existing plate mills the equipment for bending and electrically welding plates into pipe. The Petroleum Iron Works, Sharon, Pa., has been experimenting for some time with an electric welding process.

The A. O. Smith Corporation has demonstrated the success of the system on the larger sizes of pipe and has been able to make pipe down to 8 in. diameter by its method, the interesting feature of which is the speed of production. Running on 24-in. pipe, that company has stated its ability to produce six to eight miles per day.

SOURCES OF AMERICAN IMPORTS OF IRON ORE (In Gross Tons)

	August		Eight Months Ended August

Conference Board for New York Iron Trade

Representatives of the warehousemen's associations and the iron contractors' associations in metropolitan New York met on Sept. 26 to organize a Conference Board for the general benefit of the iron trade in the territory. An equal number of representatives of the warehousemen's associations, the Iron and Steel Warehouse Institute and the Iron and Steel Dealers Credit Association of Greater New York, and of the contractors' associations, including the Allied Building Metal Industries, the Iron League of New Jersey, the Associated Iron Masters of Manhattan, Bronx and Westchester and the Iron League of Brooklyn and Long Island were present and selected George Boochever, attorney for the Iron League of Brooklyn and Long Island, as counsel and secretary. He was formerly treasurer of the Manhattan Knitting Mills, New York, and while in that field he drafted the code of ethics which was adopted by the National Knitted Outerwear Association.

Form New York Chapter of Scrap Institute

David Strauss, president Continental Iron & Steel Co., New York, was elected chairman of the New York chapter of the Institute of Scrap Iron and Steel, at a meeting of scrap iron dealers of New York and surrounding territory, on Sept. 27, at the Hotel Astor. The other officers of the New York chapter are: Thomas G. Watson, Brooklyn, first vice-chairman; Howard Vandewater, W. Vandewater, Inc., Brooklyn, second vice-chairman; Al Gerson, Harlem Metal Corporation, New York, secretary; Louis Fisher, Fisher Brothers Scrap Iron & Steel Co., New York, treasurer; and John McGrath, McGrath Iron Co., Inc., Brooklyn, Charles Pfeiffer, Charles Pfeiffer & Co., Inc., New York, and Harry Daly, Harry A. Daly Iron & Steel Co., Long Island City, executive committee. Herman D. Moskowitz, M. Samuels & Son, presided at the New York conference.

The New York chapter is the first of ten chapters to be organized through the Eastern section of the United States. The scrap iron dealers of Philadelphia, Chester, Pa., and Wilmington, Del., and neighboring communities met at dinner at the Manufacturers Club, Philadelphia, Oct. 2, to organize a chapter for the Philadelphia district. Joseph G. Hitner, Henry A. Hitner Sons Co., president of the institute, acted as host.

As a result of a conference addressed by Benjamin Schwartz, director general of the institute, in Springfield, Mass., New Haven and Hartford, Conn., arrangements are being made for a State conference in Hartford on Oct. 10 for the purpose of organizing a Connecticut chapter and electing officers.

Among recent applications for membership in the institute are Joseph

Freedman Co., Inc., H. Goodman & Sons, and Barney Carlson, Springfield, Mass.; B. Barowsky, Holyoke, Mass.; Berman Bros., Continental Iron & Steel Co., Hausman-Wimmer Co., Thomas F. Kelly, Luria Brothers, New York Scrap Iron Co., M. Samuels & Sons, Inc., S. Snyder Corporation, Harlem Metal Co., Thomas G. Watson, New York; Harry A. Daly, Long Island City; Kingston Scrap Iron & Metal Co., Kingston, N. Y.; Charles Pfeiffer & Co., Inc., Fisher Brothers Scrap Iron & Steel Co., New York, and United Scrap Iron & Steel Co. and John V. McGrath Iron Co., Inc., Brooklyn.

Discuss Airplane Making at Wichita

Airplane engines and commercial plane production were the chief topics of discussion at an aeronautic meeting held on Sept. 21 and 22 at Wichita, Kan., under the auspices of the aeronautic division of the American Society of Mechanical Engineers. The future supply of engines, the lack of which has been seriously handicapping the manufacture of airplanes, was considered by Richard M. Mock, of the Bellanca Aircraft Corporation, in a paper at the engine session. He discussed the various types of engines on which experiments are now being made, and also those ready to go into production. R. K. Cummings, chief of the automotive power plant section, Bureau of Standards, Washington, dealt with methods and requirements in testing commercial airplane engines of medium power.

The transition of airplane construction from its formative period to one of mass production was emphasized at a symposium on commercial plane production, at which papers were presented by Walter H. Beech, president Travel Air Mfg. Co.; E. E. Porterfield, Jr., president American Eagle Aircraft Co., Kansas City, and Jerome Lederer, Aertech, Moline, Ill. The second day of the meeting was given over to inspection of local plants at Wichita, which this year are producing 25 per cent of the country's airplanes.

Ryerson Acquires E. P. Sanderson Co.

The plant, merchandise and good will of the E. P. Sanderson Co., Kendall Square, Cambridge, Mass., have been acquired by Joseph T. Ryerson & Son, Inc., Chicago. The Sanderson plant, which is one of the largest iron and steel warehouses in New England, will give the Ryerson company a large increase in plant facilities and tonnage and enable it to maintain better service in the shipment of iron and steel in New England. The kindred lines of the two companies include steel bars, reinforcing bars, shafting, I-beams, channels, angles, tees, steel sheets, steel plates, boiler tubes, rivets, bolts, nuts, etc.

New England Association Holds Fall Outing

The New England Iron & Hardware Association held its annual fall outing on Tuesday, Sept. 25, at the Tedesco Country Club, Swampscott, Mass., approximately 100 members and guests attending. The afternoon was given over to a golf tournament and the evening to dinner and presentation of prizes.

A. P. Chase, Chase, Parker & Co., Boston, with the best gross golf score, was awarded a handbag donated by Franklin E. Bragg, N. H. Bragg & Sons, Bangor, Me., president of the New England organization. Mr. Chase also won the Damon cup, donated by the Fitchburg Hardware Co., Fitchburg, Mass., which has been played for by members for three or four years.

C. B. Doten, H. L. Doten & Sons, Boston, with the second best score, was awarded a clock donated by the Bethlehem Steel Co. The best net score was halved by A. B. Peck, American Screw Co., Providence, R. I., and George M. Heath, Atlas Tack Co. Mr. Heath won the toss and selected a golf bag donated by the Central Alloy Steel Corporation, while Mr. Peck took a silver platter given by the John B. Varick Co., Manchester, N. H. With the second best net score eliminated, George E. McClintock, John B. Varick Co., with a third was awarded a dozen golf balls, as was E. C. Church, E. C. Church Co., Providence, with the fourth best net score. Three players had the fifth best net score: Peter Gray, Peter Gray & Son, Inc., Cambridge, Mass.; L. W. Barta, Avery & Saul, South Boston; and Samuel Boyed, E. Corey Co., Portland, Me. Mr. Boyed won the toss and was given a dozen golf balls. The golf balls were donated by the American Steel & Wire Co., Boston; the Standard Horse Shoe Co., Boston; and the Belcher, Loomis Hardware Co., Providence.

Columbia Steel Corporation Buying Tin Mill Units

YOUNGSTOWN, Oct. 2.—L. A. Jones, general purchasing agent Columbia Steel Corporation, San Francisco, is in the East making purchases for the new 6-mill tin plate plant which that company will build at its Pittsburg, Cal., works and which is expected to be completed and in operation next March. The new plant will be of conventional modern type, in which no attempt will be made at the outset of operations to employ, as is being done in some Eastern plants, the continuous mill for breaking down the bars. Automatic doublers, shears, a Gray type black pickling unit and all of the tinhouse equipment will be furnished by the Aetna-Standard Engineering Co., Youngstown. Six stands of hot and a like number of cold mills and the drives for them are to be let by Mr. Jones during his visit.

Manufacturers' Cooperation in Simplification

Answering the question, "Do the smaller manufacturers participate in simplification?" the division of simplified practice of the United States Department of Commerce says that 46 per cent of the 212 producer-acceptors behind 10 simplified practice recommendations are capitalized at \$500,000 and over, 26 per cent between \$100,000 and \$500,000, and 14 per cent below \$100,000. The capitalization of the remainder is not reported. Analysis of the published credit ratings of the 212 acceptors shows 41 per cent rated at \$500,000 and over; 32 per cent between \$75,000 and \$500,000; 12 per cent between \$3,000 and \$75,000, and 15 per cent "not reported."

Included in the 10 recommendations reviewed are:

	Items Reduced		Per Cent Reduction
	From	To	
Files and rasps...	1,351	475	65
Range boilers.....	130	13	90
Builders' hardware:			
Items	6,948	5,130	26
Finishes	100	29	71
Eaves trough and conductor pipe..	21	16	24
Steel lockers.....	65	17	74
Sidewalk, floor and roof lights:			
Sizes	120	6	95
Styles	80	5	94
Shapes	10	2	80
Wrought iron and wrought steel pipe, valves and fittings:			
Sizes of valves and fittings...	20,000	19,238	4
Sizes of pipe....	62	49	21

All of these have been in operation sufficiently long to permit determination of the adherence accorded them by their producer-acceptors. The average adherence, i.e., per cent of product conforming to the terms of the simplification program, is 90.3 per cent. Since the division of simplified practice does not indorse and publish any recommendation until the latter has been accorded 80 per cent acceptance by the industry, according to volume of output, the figures indicate that the smaller as well as the larger companies are cooperating in simplification.

German Automobile Output Shows Increase

HAMBURG, GERMANY, Sept. 17.—Automobile production in this country is registering a steady gain, although, compared with the output of motor cars in the United States, it is of negligible size. In 1913 the total output of automobiles in Germany was 11,700; in 1925 the production was 55,000 cars; in 1926, 54,500; in 1927, 72,000 cars, and the estimate for 1928 is about 100,000. Among European producing countries Germany now ranks third; Italy was third in 1927.

About 50 per cent of the German motor car industry is controlled by the

Opel Werke Russelsheim and its subsidiary companies. In addition to making 50 per cent of the passenger cars manufactured, this interest annually produces about 17,000 commercial vehicles, trucks and buses, a large proportion of which are exported. Since 1925 the average price per car manufactured in Germany has decreased about 38 per cent. In addition to the probable domestic production of 100,000 cars this year, about 22,000 cars will have been assembled by American and French plants in Germany.

German Engineers Building African Steel Plant

HAMBURG, GERMANY, Sept. 18.—Two leading engineers of Gutehoffnungshütte, Oberhausen, have been sent to South Africa, where they will work with Dr. Lilges of Gutehoffnungshütte on the construction at Daspoort of a steel works for the South African Iron & Steel Corporation, owned by the South African Government. When the plant is completed, more engineers may be sent to South Africa to aid in its operation.

New England Industrial News

The Union Water Meter Co., Worcester, Mass., pioneer in that special line, has celebrated its sixtieth business year. H. A. B. Etheredge is president and Edward S. Otis is treasurer.

George S. Case, president Peck, Stow & Wilcox Co., Southington, Conn., states that the company is completing a revamping of its mechanical equipment in the various plants. By the end of 1928 the company should be in a mechanical position to increase annual profits.

Production at the Anaconda Copper Mining Co.'s subsidiary, the American Brass Co., Ansonia, Conn., never before has been as high as it is today. Business is in such a volume that it has been necessary to reopen the so-called West rod mill, closed several years as a result of the erection of more modern shops.

The Indian Motorcycle Co., Springfield, Mass., enjoying one of the most prosperous periods in its history, is continually endeavoring to widen its field of production. The company is endeavoring to perfect a motor for electric refrigeration, a smaller unit than now generally in use and simple in design. It also is developing a shock absorber, a new four-cylinder car and new motor cycle models.

The Lyman Gun Sight Corporation, Middlefield, Conn., recently acquired the gun telescope sight business of the Winchester Repeating Arms Co., New Haven, Conn., and the rights to make Garand high-speed mechanism for Garand rifles. The Middlefield company recently purchased the J. Stevens Arms Co., Chicopee Falls, Mass. It is now the largest manufacturer of gun sights in this country.

Steel Industry Thriving in Czechoslovakia

While imports of iron and steel into Czechoslovakia during the first six months of 1928 increased, totaling 142,494 metric tons, as against 90,467 tons for the corresponding period of 1927, and exports declined, amounting to 323,855 tons, compared with 334,515 tons, the industry of that country appears to be enjoying a favorable degree of activity, according to reports received by the Department of Commerce from Prague.

The great bulk of imports into Czechoslovakia during the six-month periods of both years consisted of pig iron, 73,314 tons having come in during the 1927 period and 123,813 tons during the first six months of 1928. On the other hand, exports of pig iron during the first six months of 1927, totaling 74,020 tons, were almost equalled by outgoing shipments of some of the finished lines. For the first six months of 1928 exports of pig iron, totaling 52,222 tons, were greatly exceeded by exports of some of the finished lines, including sheets and plates, with 78,678 tons, and pipe and tubes, with 69,000 tons. Exports of bars amounted to 45,446 tons; of wire, 22,645 tons, and of miscellaneous lines, 52,998 tons. Production of both iron and steel was reported to be greatly in excess of the 1927 output.

Under the new agreement with the Continental Steel Entente, Czechoslovakia retained its previous general relation to the entente, but received a concession in that it was permitted unlimited domestic production. The export quota is 432,836 tons. Production of the Czechoslovakian industry during the first six months of 1928 is estimated at 765,000 tons of pig iron and 929,000 tons of raw steel, as against 604,000 tons of pig iron and 733,000 tons of steel during the corresponding period of 1927.

In large measure exports from Czechoslovakia find their markets in adjoining or other nearby countries. The bulk of pig iron exported in 1928 went to Hungary, with considerable tonnage going to Austria and Jugoslavia. Billets were sold chiefly in Rumania, although Germany took fairly large tonnages in March and April. Iron and steel bars find a wide market. Some reach the United States, but the best outlets for this line are Rumania, Bulgaria and Great Britain, with lesser quantities going to Germany, Austria and Switzerland. Much of the iron and steel imported into Czechoslovakia is brought in from the same countries that are its best export markets.

The American Steel & Wire Co. has placed in operation a new hot-rolled strip mill at its Cuyahoga works, Cleveland. It has a capacity for rolling material in widths from 1 in. to 3½ in. and in thicknesses from No. 23 gage to ¼ in. The product of the new mill will be used exclusively in the company's cold-rolled strip mill.

This Issue in Brief

Fairly stable and large volume of business during the remainder of the year, with fair to good earnings for the average company, is forecast by P-V Line.—Page 833.

* * *

Dies of high-speed steel favored for copper-rich die castings. Tests reveal that mild steel corrodes rapidly. Chromium plated steel resists attack, but frequent heating and cooling causes the plating to flake off.—Page 814.

* * *

Cuts annealing time in half by forced cooling. After critical range is passed, cooling of material in electric furnace is accelerated by air blown through system of cooling pipes.—Page 818.

* * *

In a bearing operating continuously, rise in temperature is independent of the length of the bearing, says machine tool builder. Temperature increase is proportional to bearing diameter, to operating viscosity of lubricant, and to the square of number of r.p.m., and is inversely proportional to the running clearance.—Page 822.

* * *

"Man factor" is an important consideration in industrial improvements. If the workman can be induced to realize the necessity for proposed changes, his efforts will contribute largely to the success of the undertaking.—Page 822.

* * *

Increase in machined surfaces on farm equipment point to larger use of machine tools. Machined steel parts are being substituted for castings, cut gears for cast gears, and anti-friction bearings are more widely employed, says farm equipment manufacturer. All these changes call for more careful machining.—Page 823.

Chromium-plated cutting tools chip off at the cutting edge when working on steel or cast iron, says electric equipment manufacturer. But the plated tools are satisfactory when used on materials other than metals.—Page 824.

* * *

Can galvanizers produce spangles if pure zinc is used? Yes, but only for a short period of time, says metallurgist, for after a few days the bath surface oxidizes if no metallic additions are made to the bath.—Page 812.

* * *

Stronger ring gear blanks, with very little waste metal, are produced by upsetting process. An upsetting die punches into the center of the bar and mushrooms the head into "doughnut" shape, with the highly refined metal from the surface of the bar on the side of the "doughnut" where the teeth of the gear will be cut.—Page 816.

* * *

Porosity in zinc-base die castings depends almost entirely on the kind of pull given the lever, investigators declare. Tensile strength of sound castings is little affected by reasonable changes in casting conditions.—Page 814.

* * *

Electric furnace for normalizing alloy steel has three pusher mechanisms, two at the charging end and one at the side. The latter pushes the charge across the width of the furnace, from charge to discharge side. Pushing is done by shoes operating in troughs, which are returned to the loading end by a conveyor.—Page 819.

* * *

Export business in machinery and steel continues to grow. Machinery sales for first eight months exceed same period of 1927 by more than 13 per cent, while finished steel sales gain 9 per cent.—Pages 870-872.

Buys new equipment when cost of repairing old is over half the purchase price of the new machine. Automobile manufacturer makes extensive repairs to old equipment only when the machine is of a special type and when it would have only a small resale value.—Page 824.

* * *

Low-chromium alloy steel rails last several times as long as Bessemer rails in many kinds of service. The alloy rails can be drilled without difficulty and do not air-harden after heating for bending.—Page 826.

* * *

Friction absorbs almost one-half the power created by rolling mill engine, says lubricating engineer. About 27 per cent of power is used in overcoming friction in engine parts, 13 per cent in overcoming rolling mill friction, and 9 per cent in overcoming pinion and spindle friction.—Page 827.

* * *

In galvanizing bath lead is not harmful, says metallurgist, for it alloys with zinc only in very small quantities, the excess lead settling to the bottom of the pot. But high iron content affects both the physical and the chemical qualities of slab zinc.—Page 813.

* * *

Compactness an important factor in machine tool design, says automobile manufacturer. The compactly built machine has many advantages over the machine with projecting parts, which make it difficult to place in progressive lineup.—Page 824.

* * *

Net gain during September of 14 blast furnaces in operation presages heavier production in October. Particularly significant was the gain of five merchant stacks, accompanied by an increase of 5½ per cent in daily production of merchant iron.—Page 844.

ESTABLISHED 1855

Better Selling of Steel

FULLY granting that the steel trade needs better merchandising methods, as has been urged by C. M. Schwab and others for a year past, it is worth while to reflect upon the great improvement in present methods over those in force before the war. Then the sellers were opportunists, carried along, and quite nicely at times, by circumstances. They criticized their methods and talked about reforms which they never seriously attempted to make. In a strong market they simply sold farther and farther ahead at successively rising prices. The sales were in the form of "contracts" which really amounted to options given the buyers. In a weak market they strove to squeeze specifications out of the remaining contracts, making downward price readjustments from time to time as circumstances seemed to force them. They complained of "the contract evil" because some customers nursed their contracts and avoided paying anything like the full open market advances while in a declining market they refused to specify; i.e., they chose not to exercise their options, which no longer had any value.

There was so little understanding of the rationale of equitable distribution of merchandise that mills talked of "enforcing" contracts and "making contracts binding," when the apparent transactions represented by the "contracts" were not by their nature susceptible of such treatment, since they were not actual sales. The only feasible reform was to abolish that form of contracting and the mills were afraid to attempt anything of that sort.

Today there is true merchandising, even though it may not be altogether good merchandising. The seller considers the circumstances of the buyer and would not force him to a loss on account of his having signed some sort of a paper. Rarely if ever did they force losses in the old days but there was much difference in profits between customers according to the kind of contract or option they had secured long previous, by chance or skill. Some customers profited hugely.

Nowadays all business is conducted on small margins and mills recognize that their customers need to be placed on the same basis as competitors. That is good merchandising and it is a vast improvement over the old way. There are contracts now, but they are only quarterly, a much smaller proportion of the steel moves under contract than formerly, and the ambition of mills is to set up a general practice requiring the completion of a quarter's specifications by the 10th or 15th of the last month in the quarter.

In several finished steel lines an improvement has been made by setting up quantity differentials for small lots in a shipment. This is better than the practice

of the recent past, but comparison cannot be made with earlier pre-war years, for then there was practically no such thing as small-lot shipments by mills. As a rule they were not in position to make such shipments.

In respect to quality extras the mills have not kept pace with the times. Steel used to be pretty much the same. Now there is increasing variety, as new uses and new requirements arise. This diversity will continue, and if its demands upon salesmanship are to be properly met prices and extras must be fitted to the cost of production and to the relative values of the materials furnished.

From Winnipeg to Buenos Aires

FIGURES could be assembled in imposing array giving in tens of millions the value of our iron and steel exports and in hundreds of millions the value of automobiles, machinery and equipment made largely from iron and steel. But the important conclusion from such a showing would be that this export movement is so large a part of our total production that its continuance or disappearance might mean the difference between prosperity and hard times at home.

Other analyses would show the destination of these exports. Getting down to essentials, we should find that America, North and South, is our own best customer. Canada absorbs most, due to propinquity and the common interests of these English-speaking nations. But an increasing amount goes south to Latin America. Our southern customers include Cuba and the other islands, Mexico and other Central American republics, and all the great states in South America. Trade with many of these has risen sharply since the war for three principal reasons: because United States corporations have developed properties and concessions within the borders of our southern neighbors, because the Governments of the latter have been large borrowers in Wall Street, and because our own export organizations have been able to meet open competition for available business.

Such facts have been the basis of statements made more than once in these columns that the countries to the south of us offer the best outlet for our future surplus in manufactures. Ways and means of fostering this trade have been discussed. Not least among these business aids are a sympathetic understanding between the peoples and ready means of communication.

Both of these will be promoted mightily by the construction of a broad, modern highway down the backbone of the two continents. The project has already had some publicity. The daily press has reported that President Coolidge and Herbert Hoover have approved

it. We are bound to hear more about it, for it is a logical way of bringing the people of these two continents into closer contact and of promoting good feeling. What would change the average Kansan's contempt for a "greaser" sooner than an automobile trip to Mexico City over a cement pavement? Nor would a Sonora rancher use the scornful "gringo" if he could tour the United States.

The tremendous traffic over our own Lincoln Highway (to mention but one) indicates what might be expected of a north-and-south route in times of peace. What such a protected, inland road would mean in war time has been understood ever since the Romans built their indestructible roads, and has been demonstrated in every war fought in the last 2000 years. "Communications" the commanding officer must safeguard first of all. In our own defense the highway would carry north essential supplies of rubber, manganese, nitrates, food-stuffs, releasing fleets of cruisers and cargo ships for other services. In our neighbors' defense it would carry south all the machinery of modern war.

Communications, mutual understanding, trade, defense, all require such a road. It should not be long postponed.

Labor as a Commodity

ONE of the inconsistencies in the tenets of labor unions is their insistence that labor is not a commodity and their common treatment of labor questions as if it were. This may be explained, however, in that it is a truism that labor is not a commodity; but it is likewise true that labor theoretically obeys the economic laws (especially that of supply and demand) which commodities obey. The national economy of this and every other country is a composite of goods and service. All of us are salesmen. The stevedore sells his muscle. The engineer sells his knowledge. In each case and in every other the remuneration is determined by the supply of the kind of service that can be rendered and the demand for it. The man who is unique can well nigh get whatever he asks if any one needs him. The man who is ordinary can get only a competitive price, unless competition be nullified; and that is a great objective of labor unionism. Perhaps it is the one great objective, and perhaps it is this that underlies the emphasized reiteration that labor is not a commodity.

The stage hands of New York, who number about 2000, were recently discussing with their employers the matter of increased remuneration, and they secured advances to \$82.50 per week for carpenters and electricians, while ordinary stage hands are now to get \$6.75 per performance. We conjecture that the art of being a stage hand does not require more than a few days training, and no doubt many college graduates would be attracted by the handsome remuneration named. But what would happen if they applied for these jobs? We need not answer the question. This is an example of the noncompetitive condition labor unions create in what they say is not a commodity.

So it is with building mechanics and men of many other vocations in unionized territory who assume the principles and practice of a monopoly for their respective guilds. Competition between workers in the sense of an open market is the last thing in the world they think of permitting. Their only deference to

economic law is to increase their efficiency when demand is poor and to decrease it when demand becomes strong. This may explain in part why their leaders do not like to have labor referred to as a commodity.

Heavy Steel Export Movement

IRON and steel exports from the United States in August were larger than in any month since early 1921. However, so much scrap was included that the amount of finished material was less than that recorded for each of six months in the past seven-and-a-half years. Of the 287,297 tons exported in August, no less than 70,538 tons was iron and steel scrap. The highest previous tonnage of scrap went out in June—64,918 tons. The five months ended with August have shown an outward scrap movement of 279,272 tons, each of these months having been above 40,000 tons. Only once before (September, 1920) was 40,000 tons reached. Italy, Germany, Japan and Canada have been buyers of American steel melting scrap for some months on an unusual scale.

Finished products exported in August amounted to 179,085 tons, the largest total since the 196,734 tons of January, 1927. Semi-finished exports were 20,020 tons, the largest (except for last May) in eight years, or since August of 1920. Pig iron and ferroalloys, at 9445 tons, fell below the previous month, but with that exception led all the months since June, 1926. The total of iron and steel exports for the eight months, excluding scrap, was nearly 14 per cent ahead of last year's for the like period. With scrap included, the eight months' tonnage was above the twelve months' total of 1925 or 1924.

Coal Value Lower in Strike Year

DESPITE the union bituminous coal strike which began April 1, 1927, and technically is not ended yet, the average value of coal at mines decreased from 1926 to 1927. Bituminous coal dropped from \$2.06 to \$1.99. Anthracite, with no strike, dropped from \$5.62 to \$5.26. Bituminous prices are running still lower this year.

The final figures now compiled show total bituminous coal production in 1927 at 517,763,352 net tons, which represents 9.7 per cent decrease from 1926. The price record shows that there was an ample supply of coal. The decrease in tonnage may be ascribed in part to the laying in of stocks late in 1926 against the expected strike, to a little decrease in industrial activity in the latter part of 1927, and to the exceptional 1926 exports due to the British coal strike.

It is not true that the total consumption of bituminous coal has been decreasing. Demand merely failed to increase as formerly, and thus with increasing capacity prices could not hold. The gain in production has been insignificant in recent years. It was rapid through 1912 and 1913, each of those years making a new record by a large margin; but the combined production of 1926 and 1927 exceeded the 1912-13 production by only 17.5 per cent, with a lapse of 14 years. Widespread economies in the use of coal account for the small increase, when the service rendered, with

the large expansion in industrial operations, increased so greatly.

In the bituminous industry the average number of days worked decreased from 1926 to 1927 by $7\frac{1}{2}$ per cent, from 215 days to 199 days, when production, as shown above, decreased by slightly less. The average output per man per day increased from 4.50 to 4.55 net tons, showing that the switching of production from union to non-union did not involve a decrease in efficiency.

The quantity of coal coked at mines decreased from 17,751,549 tons in 1926 to 10,719,633 tons in 1927, showing a further dwindling in the amount of beehive coking. The 1927 quantity coked was only 2.1 per cent of the total production.

Bituminous production is running still lighter this year. All this simply means that there is no hope of coal miners receiving what could be called good wages, when there are so many more men anxious to mine coal than the coal requirements of the country can engage. More light could be thrown upon this vexed coal problem if more attention were given to the mental or human side. Why do men become coal operators and coal miners? Many have become operators because they chanced to own coal lands and were not willing to wait until the demand really worked around to them.

WITH a world's production of over 206,000 metric tons, last year made a new record for the aluminum industry, assuming the correctness of data published by a German statistical bureau. American pre-eminence is marked, domestic plants producing 75,000 tons or 36 per cent of the total, against 35 per cent in

1926. American consumption (including Canada) at 88,000 tons last year compares with 106,000 tons in 1926; but there was a marked increase in the German consumption, which was 35,900 tons, or 60 per cent more than in 1926. In the next year or so, however, American consuming industries promise to forge ahead, as the development and use of new light, strong alloys are rapidly extending. In this connection the expansion of our aircraft industry is a highly important factor. World production and consumption of aluminum are now about three times the rate just before the war, while American output is over four times and consumption about two-and-a-half times that of 1913.

AN illuminating example of the counterplay of economic forces is quoted in a recent British official report on business in Belgium. Commenting on the difficulties of the machinery manufacturers, it notes the formation of various amalgamations and cartels for control of the markets at home and abroad, evidently for one main purpose—to increase the amount of money secured for the product. That such a movement can be carried too far, and also is vulnerable to attack, appears from a statement on the next page of the same report: "The Garagists' Association has secured the cooperation of the trade association of motor car dealers to form a 'Tires Purchase Syndicate' for breaking the monopoly exactions of the tire manufacturers' ring, and for facilitating distribution and supply of tires to members." Whenever producers organize a really effective monopoly, consumers set out forthwith to "break the ring!"

CORRESPONDENCE

Investors and the Stock Market

To the Editor: Your editorial on page 779 of the Sept. 27 issue asks "Why This Stock Market?" and then answers the question very ably. While I agree with all you say, I think there is another factor that is generally overlooked.

I refer to the present stagnant and depressed condition of the real estate market, especially with respect to one and two family private residences. The time is not so far back when the average man of the middle class in income, having secured his own home and accumulated additional reserve, bought another similar residence to rent. Here was a transaction he knew how to handle, which yielded him a safe income, also a probable increase in value, and gave him community prestige. But times have changed. A private residence for rent is at best only likely to bring normal interest on its cost, and oftentimes only pays expenses, with no return on the investment. Many residential centers are overbuilt; the trend toward apartment houses in our large cities is in full swing, and houses are not renting. The man of small means with a little surplus hesitates at putting it in a house to rent today. He thinks of all the problems of painting, repairs, taxes, uncollected rent, vacant property, and inability to sell when he wants to; and unless he believes the particular property has business possibilities he turns to the stock market.

Why? Because in the stock market he has but three problems to face—when to buy, when to hold and when to sell. All details of the management of the investment are

out of his hands; he has nothing to watch but the stock quotations. If he has made an unfortunate buy, he can liquidate at any time, take his loss and start over. Not so with private residential real estate. He has the ever recurring details to decide and often he cannot sell when he would like to, at any price. Is it any wonder that, having discovered the stock market, which he can enter with a small investment, gradually increasing his holdings, he is going to it to an increasing extent? If, as pointed out in the editorial, he is investing in sound organizations and businesses regardless of present dividend rates, his regularly increasing participation is increasing the demand and putting prices up gradually to a high level. This situation is, to my mind, no small factor in the answer to the question, "Why this stock market?"

JOHN F. HARDECKER.

Brooklawn, N. J., Sept. 28.

Railroad Facts

A year book on railroad information, 1928 edition, has been put out by the Western Railways' Committee on Public Relations, Chicago. It consists of 96 pages with diagrammatic illustrations and a five-page index. The book shows the growth of the railroad physical plant in mileage, locomotives, cars, etc., with comparisons with other countries, the growth in the money investment of the plant, the growth in car loadings year by year, and a considerable amount of collateral or derived information of special interest to those studying the railroad situation. Particularly are shown the reductions in fuel required for a given traffic performance, the elimination of car shortages, increase in freight train speeds and in tonnage carried by the average train.

Fabricated Structural Steel

New York Subways Call for 15,100 Tons—Week's Awards Total 33,850 Tons and New Projects 41,000 Tons

WITH two sections of the New York subway calling for 15,100 tons, and approaches to the Detroit River tunnel, 4500 tons, new projects reported during the week totaled 41,000 tons. Awards amounted to 33,850 tons, the largest having been a manufacturing building at Meadville, Pa., requiring 4500 tons. Awards follow:

BOSTON, 127 tons, building alterations on Boylston Street, to unnamed fabricator.
STATE OF VERMONT, 150 tons, highway bridge, to American Bridge Co.
NEW YORK, 2000 tons, addition for R. H. Macy & Co., to Levering & Garrigues Co.
NEW YORK, 1300 tons, building in East Tenth Street for Sailors Snug Harbor, to Hedden Iron Construction Co.
NEW YORK, 1200 tons, apartment building at 101st Street and Fifth Avenue, to Harris Structural Steel Co.
NEW YORK, 1000 tons, apartment building at 107th Street and Broadway, to Easton Structural Steel Co.
NEW YORK, 238 tons, New York Central Lines, Mott Haven yard improvements, to Jones & Laughlin Steel Corporation.
HEMPSTEAD, N. Y., 200 tons, Professional Building, to Hay Foundry & Iron Works.
GOWANDA, N. Y., 250 tons, State bridge, to American Bridge Co.
JEROME, PA., 160 tons, Hillman Coal & Coke Co. coal storage bins, to Jones & Laughlin Steel Corporation.
MERCER COUNTY, N. J., 100 tons, bridge, to N. A. K. Bugbee.
PHILADELPHIA, 550 tons, Circle Theater at Frankford, to Bethlehem Fabricators, Inc.
PHILADELPHIA, 210 tons, building at Broad and South Streets for Southwestern National Bank, to S. G. Matthews, Philadelphia.
PHILADELPHIA, 260 tons, mill building for Heintz Mfg. Co., to Lehigh Structural Steel Co.
MEADVILLE, PA., 4480 tons, plant for Viscose Co.
WAYNESBORO, VA., 2400 tons, buildings for Du Pont Engineering Co., to Virginia Bridge & Iron Co.
QUANTICO, VA., 300 tons, Marine barracks, to Virginia Bridge & Iron Co.
WASHINGTON, 2300 tons, office building for Southern Railway Co., to Barber & Ross.
CANTON, N. C., 150 tons, bridges, to Austin Brothers Co.
PENSACOLA, FLA., 200 tons, airplane hangar and station, to Ingalls Iron Works Co.
TUSCALOOSA, ALA., 180 tons, Gulf States Paper Corporation plant, to Ingalls Iron Works Co.
MEMPHIS, TENN., 950 tons, floor repairs for Harahan Bridge, to American Bridge Co.
CINCINNATI, 550 tons, building for Container Corporation of America, to Oregon Bridge Co.
LOCKLAND, OHIO, 1000 tons, manufacturing building for Tennessee Copper & Chemical Co., to Fort Pitt Bridge Works; reported last week to unnamed fabricator.
ZOARVILLE, OHIO, 270 tons, highway bridge; from E. Elford & Sons Co., general contractor, to Massillon Bridge & Structural Co.
CLEVELAND, 430 tons, building for Eaton Axle & Spring Co., to McClintic-Marshall Co.
GRAND FORKS, N. D., 1177 tons, Red River bridge, to Minnesota Steel & Machine Co.
GREAT NORTHERN RAILROAD, 1900 tons, bridges, to American Bridge Co.

CHICAGO, 2800 tons, garage, to American Bridge Co.
STATE OF ILLINOIS, 1000 tons, highway bridges, distributed among several unnamed fabricators and Continental Bridge Co.
ST. LOUIS, 200 tons, bridge for Southern Railway, to American Bridge Co.
GROTTO, WASH., 140 tons, crane runway for Northwestern Portland Cement Co., to Wallace Bridge & Structural Steel Co.
SAN FRANCISCO, 1550 tons, five 80,000-bbl. tanks for Shell Oil Co., to Western Pipe & Steel Co.
SAN FRANCISCO, 100 tons, hotel, Eddy Street near Hyde, to McClintic-Marshall Co.
STOCKTON, CAL., 130 tons, two plants for Fibreboard Products Co., one at Antioch and one at Stockton, to Moore Drydock Co.
SANTA BARBARA, CAL., 1550 tons, five 80,000-bbl. tanks for Rio Grande and Barnsdall Oil companies, to McClintic-Marshall Co.
LOS ANGELES, 1200 tons, Richfield Oil building, to Llewellyn Iron Works.
LOS ANGELES, 800 tons, three apartment buildings, to Union Iron Works.
SAN DIEGO, CAL., 725 tons, warehouse for Navy Department, to Llewellyn Iron Works.
SAN DIEGO, 525 tons, Fox Realty building, to Llewellyn Iron Works.
SANTA ANA, CAL., 100 tons, store, Second Street and Broadway, to Union Iron Works.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

NEW YORK, 15,100 tons, subway work; 3600 tons in section 5-A, route 109, bids Oct. 9, and 11,500 tons in section 2-A, route 108, bids Oct. 11.
NEW YORK, 500 tons, Junior League building in East Seventy-first Street; George A. Fuller Co., general contractor.
STATE OF NEW YORK, 200 tons, highway bridges.
ROCHESTER, N. Y., 450 tons, baseball grandstand.
WILKES-BARRE, PA., 400 tons, Bell Telephone Co. building.
BALTIMORE, 1600 tons, pier shed at McComas Street terminal improvement.
VIRGINIAN RAILWAY, 300 tons, bridge.
DETROIT, 4500 tons, approaches to Detroit River tunnel.
CINCINNATI, 2000 tons, building for Union Gas & Electric Co.; bids Oct. 10.
CHICAGO, 2600 tons, three junior high schools.
CHICAGO, 850 tons, two buildings for University of Chicago.
CHICAGO, BURLINGTON & QUINCY RAILROAD, 1500 tons, bridge and other work.
ILLINOIS CENTRAL RAILROAD, 400 tons, bridge work.
DULUTH, MINN., 1500 tons, reconstruction of bridge.
DAVENPORT, IOWA, 500 tons, bridge for Chicago, Rock Island & Pacific.
HERMANN, MO., 2500 tons, toll bridge across Missouri River.
PITTSBURG, CAL., 2500 tons, tin plate mill building for Columbia Steel Co.; bids received.

LOS ANGELES, 2000 tons, Bullock's department store, Wilshire Boulevard; bids received.

LOS ANGELES, 160 tons, apartment building at Beverly Hills; bids being taken.
OLYMPIA, WASH., 230 tons, Kalama River bridge; general contract to Gilpin Construction Co., Astoria, Ore.
OLYMPIA, 120 tons, Coweeman River bridge; general contract to J. J. Badraun, Portland, Ore.
PORTLAND, ORE., 243 tons, Gardiner bridge over Yellowstone River in Montana; bids opened.
HOOD RIVER, ORE., 1200 tons plates, pipe line; bids Oct. 10.

Steel Tariff Agitation On in Canada

TORONTO, ONT., Oct. 2.—Conflict has arisen between the two largest steel companies in Canada as to the fiscal policy best suited to their interests. Over a year ago the British Empire Steel Corporation applied to the Tariff Advisory Board for a recommendation favorable to a bounty on steel and the removal of the drawback on coal used in its production. The Steel Co. of Canada, Ltd., Hamilton, Ont., through its president, Ross H. McMaster, has just filed a lengthy brief with the Tariff Board now in session at Ottawa, Ont., opposed to the British Empire Steel Corporation's argument. It opposes the bounty system as a means of aiding the industry as distinguished from a tariff, while it also strongly resists any proposal of removing the drawback on coal used in the production of steel. The general claim is that what is proposed by the British Empire Steel Corporation is not for the benefit of the steel industry as a whole, but instead only for one company and one locality, the Maritime Provinces, a policy which is not considered in the public good.

The application of the Algoma Steel Corporation for tariff changes will be heard by the Advisory Tariff Board, at Ottawa, beginning today. Alterations suggested in the application would abolish drawbacks in some instances and impose new or higher duties in others. It is proposed to abolish the drawback of 99 per cent of duty on steel for springs and axles used in the manufacture of automobiles. The brief says: "It is acknowledged that the automobile industry is reasonably protected under the present Canadian tariff and there appears no justification for allowing spring steel or axle steel bars for automobiles to be imported from foreign sources under a rebate of 99 per cent of the duty." The proposed changes would still allow such steel to come in under the drawback when used in the manufacture of agricultural implements. It is also asked that imported spiral spring steel be no longer subjected to a 99 per cent drawback when used in the manufacture of railroad spiral springs. The brief urges the imposition of a duty of 35 per cent ad valorem general and British preference on alloy steel.

Small Gain in September Iron Output

Daily Rate Last Month Gained 897 Tons or Nearly One Per Cent
Over August—Net Gain of 14 Furnaces

SEPTEMBER pig iron output, from data collected largely by wire on Oct. 2, made a small increase over August. There was, however, a large net gain in furnaces, most of them put in operation during the closing days of the month. Seventeen were blown in and three shut down, a net gain of 14.

Total September coke pig iron output was 3,062,314 gross tons or 102,077 tons per day for the 30 days as contrasted with 3,136,570 tons or 101,180 tons per day for the 31 days in August. This is an increase of 897 tons per day or 0.88 per cent. In August the increase was 2089 tons or 2.1 per cent. The September daily rate last year was 92,498 tons, which

was a decline from August of that year of 2575 tons. As in August this year, the September output showed an increase over the preceding month, contrasting with decreases last year.

Capacity Active on Oct. 1

On Oct. 1 there were 197 furnaces active having an estimated operating rate of 106,755 tons per day. This compares with an operating rate of 98,730 tons per day for the 183 furnaces active on Sept. 1. Many furnaces during September were operated at a higher rate than in August.

Of the 17 furnaces blown in during September, six were Steel Corporation stacks, five belonged to independent steel companies and six to mer-

chant producers. Only two Steel Corporation stacks were blown out and one merchant stack. Thus the gain for the month was nine steel-making furnaces and five merchant.

Steel and Merchant Iron

Steel-making iron last month was made at the rate of 82,590 tons per day or slightly less than the 82,642 tons per day in August. There was an increase in the merchant iron daily rate of production in September over August, or 19,487 tons per day against 18,538 tons per day.

Furnaces Blown In and Out

During September the following furnaces were blown in: One Susque-

*These totals do not include charcoal pig iron. The 1927 production of this iron was 164,569 tons.

Daily Pig Iron Output in September Was 0.88 Per Cent More Than in August; Composite Prices Substantially Unchanged
Inclined line represents the gradually increasing theoretical needs of the country, ascertained by a balancing of the ups and downs in production. It shows an average yearly increase in consumption of about 415,000 tons

hanna stack of the Hanna Furnace Co. in the Buffalo district; the Brooke furnace in the Schuylkill Valley; one Carrie and one Clairton stack of the Carnegie Steel Co., one Midland stack of the Pittsburgh Crucible Steel Co. and one Monessen stack of the Pittsburgh Steel Co. in the Pittsburgh district; one Haselton furnace of the Republic Iron & Steel Co. in the Mahoning Valley; the Sharpsville furnace in the Shenango Valley; one Joliet and one Gary stack of the Illinois Steel Co., one Federal furnace and one Iroquois stack of the Youngstown Sheet & Tube Co. in the Chicago district; one furnace of the Colorado Fuel & Iron Co. in Colorado; one furnace of the Gulf States Steel Co., one

Woodward stack of the Woodward Iron Co. and one Bessemer and one Fairfield stack of the Tennessee Coal, Iron & Railroad Co. in Alabama.

The three furnaces blown out or banked were the Pulaski stack in Virginia and one Joliet and one South Chicago furnace of the Illinois Steel Co. in the Chicago district.

Possibly Active Stacks Unchanged

The Crumwold furnace of the Reading Iron Co. in the Lehigh Valley has been sold and will probably be dismantled. The new No. 6 Fairfield stack of the Tennessee Coal, Iron & Railroad Co. at Fairfield, Ala., was blown in during the month, leaving the number of possibly active fur-

naces in the United States unchanged at 339.

Fabricated Plate Orders Much Higher

WASHINGTON, Oct. 2.—Orders for fabricated steel plate in August totaled 47,245 tons, or 59.9 per cent of the capacity of the 51 companies reporting to the Department of Commerce. Orders in July were 35,959 tons, or 46.8 per cent of capacity. August orders were distributed as follows: Oil storage tanks, 24,807 tons; refinery materials and equipment, 1724 tons; tank cars, 892 tons; gas holders, 1814 tons; blast furnaces, 429 tons; stacks and miscellaneous, 17,579 tons.

*Includes output of merchant furnaces.

Tests of the new Diesel type aircraft engine developed by Capt. L. M. Woolson, of the Packard Motor Car Co., are being made at the Packard proving grounds near Utica, Mich. Col. J. G. Vincent, vice-president in charge of engineering for Packard, is directing the work. Dr. Hermann Dornier, a German authority on Diesel engines, and Adolph Widman have been assisting Captain Woolson in the development work. The new Packard engine weighs less than 3 lb. per hp. developed, as compared with 100 lb. per hp. for light Diesel engines previously produced.

Iron and Steel Markets

Market Gains in Strength

Fourth Quarter Advances in Sheets, Bars and Shapes

Established in Sales—Basic Pig Iron in

Valleys Up 75c. a Ton—Scrap Higher

HEAVY bookings, lengthening deliveries and added strength in prices of both finished and primary materials place the iron and steel industry on an unusually stable basis as it enters the final quarter of the year.

The September bulge in specifications against third quarter contracts gave steel producers excellent backlogs. Mills are four to six weeks behind on deliveries of bars and some finishes of sheets, and the size of their obligations is influencing their attitude on prices.

A test of the market was not expected so soon after the close of a quarter, but an encouraging volume of business has already been placed at fourth quarter prices, which for black and galvanized sheets, bars, plates and shapes represent an advance of \$2 a ton.

This fact points to a demand for steel that is based on actual consumption. While buyers, in some cases, have been rebuilding their stocks, there has been no evidence of speculative purchases. The flow of business this year has been even steadier than in 1927. The decline from the peak rate of output in April to the low point in June was only 17 per cent, compared with a 30 per cent dip last year.

Pressure on the mills for steel has resulted in the lighting of additional blast furnaces. Out of 17 stacks blown in during September, 10 were started in the last week of the month. The net gain in active furnaces was 14, of which nine were steel works units. Such an increase may indicate a further expansion in steel output in October, which in the past has frequently been the premier month in production in the second half of the year. Heavier pig iron output may be dictated also by the growing scarcity of scrap.

An increasing quantity of scrap is being shipped out of the country, and a considerable amount is being diverted to new domestic markets. Exports of scrap in August, at 70,500 tons, were the largest on record, representing nearly one-fourth of our total outward movement of iron and steel. Shipments of scrap from Detroit, one of our largest producing centers, are moving more largely by water to Lake Erie ports instead of by rail, as formerly, to the Valleys. Lake shipments so far this season to one Buffalo consumer alone total 200,000 tons.

A direct result of the diversion of Detroit district scrap is an advance of 75c. a ton on basic pig iron in the Valleys. An inquiry for 12,000 tons of that grade found producers uninterested because they expect to consume all that they can make.

Meanwhile heavy melting scrap has advanced 25c. a ton at Pittsburgh and Chicago, and 50c. at Philadelphia. Prices at Pittsburgh are the highest since January, 1927.

Among the consuming industries, the railroads are taking a more prominent role. The Detroit, Toledo & Ironton has placed 12,500 tons of rails, and purchases by the New York Central and the Pennsylvania are expected next week. The Canadian National is inquiring for 15,000 tons. The rail buying movement, it is believed, will result in fully as large bookings as that of a year ago.

The Louisville & Nashville plans to purchase 2000 cars, and the Santa Fe is a prospective buyer of equipment. The Canadian National has ordered 55 locomotives, and is inquiring for five additional engines and 1500 box cars, besides tank and passenger cars.

Prospective construction work likely to be placed in the fourth quarter calls for 425,000 tons of structural steel, not including projects of less than 1000 tons each. Mill bookings of structural shapes in September were the largest of any month this year.

The buoyancy of consumption is indicated by the continued pressure for shipments, following heavy deliveries in the third quarter. Shipments by Chicago mills in that period were 15 per cent larger than in the preceding quarter. Steel ingot production at Chicago is now slightly over 85 per cent, which continues to be the average rate of the Pittsburgh district, as well as the Steel Corporation subsidiaries. Sheet production is particularly high, exceeding 90 per cent of the capacity of the country.

Pig iron production in September, according to data collected by THE IRON AGE, was 3,062,314 tons, compared with 3,136,570 tons in August. The average output per day, however, showed an increase, although it was less than 1 per cent. Nevertheless, with the blowing in of furnaces toward the end of the month, the daily capacity of stacks in blast Oct. 1 was 106,755 tons, against 98,730 tons Sept. 1.

This sharp gain appears warranted, in part, by the record of nine months' production. The steel ingot tonnage so far this year will prove to be some 10 per cent greater than that of the corresponding period of 1927, while the pig iron output is 1 per cent less, comparing the same periods. In both 1926 and 1927, for every 100 tons of steel made 83 tons of pig iron was produced. So far in 1928 the ratio is 100 to 75.

Both of THE IRON AGE composite prices have advanced, that for pig iron reaching \$17.84 a gross ton, the highest figure since the end of October, 1927. The finished steel composite is 2.362c. a lb., compared with 2.348c. in the previous eight weeks.

On export business there are frequent variations from the above prices. Also, in domestic business, there is at times a range of prices on various products, as shown in our market reports on other pages.

Pittsburgh

Steel Industry Starts Fourth Quarter With Large Supply of Orders—Basic Pig Iron Advances 75c.

PITTSBURGH, Oct. 2.—The final quarter of the year starts with the steel industry very well supplied with orders—the result of the September rush of specifications on third quarter contracts and the fact that in a number of products buyers were able to get mills to take additional business for immediate specification, but for shipment at mill convenience. Steel makers are well satisfied with the business side of the picture, and, while they have not succeeded in lifting prices on fourth quarter contracts as high as they desired, some advance has been obtained.

Steel works operations still are strong and at fully 85 per cent of capacity, and blast furnace operations are higher than they have been, four local steel works stacks having been blown in recently.

The undertone of the steel market is stronger, and there is a confident feeling among steel manufacturers. Some are beginning to believe that the consumption of steel is closer to what might be termed easy running capacity than has been supposed. That the flow of business has been steadier so far this year than it was last year is indicated by the fact that the fluctuation in the rate of ingot production from the high point in April and the low point in June was slightly less than 17 per cent, against a 30 per cent variation in the first eight months of last year.

While lately there has been some evidence that consumers were rebuilding their stocks, there is no sign that any of the buying recently or over the year to date has been at all speculative.

Primary materials attract attention this week, with something of a "pinch" in basic iron, the price of which has risen very sharply in the anxiety of consumers to secure supplies. The scarcity of scrap enters into the basic iron situation, as a diversion of scrap from its former channels, due to water-borne movements from Detroit to Eastern steel pro-

ducing centers, is the primary reason for one large inquiry for basic iron. Heavy melting steel has moved to solid ground at \$17, under fresh mill buying*and the fact that a shortage still exists.

Pig Iron.—Inquiries for basic iron totaling more than 20,000 tons have developed that there is very little of this grade for sale, and, in the anxiety of consumers to secure some, the price has risen sharply. As much as \$17, Valley furnace, has been obtained for approximately 2200 tons, or 75c. a ton advance over the nominal minimum price of a week ago. Smaller lots also have been moved at that price, and, while one sale of between 2000 and 3000 tons is noted at \$16, Valley furnace basis, it developed that the iron was below standard grade and the price obtained for it was fully 75c. a ton above that at which it was offered several weeks ago. Moreover, a Youngstown steel company reports having been obliged to refuse an order for about 12,000 tons, not because of an unsatisfactory bid, but because the prospect is that this maker will not have any surplus basic iron during the remainder of the year. It is not believed that yard supplies of this grade are exhausted, but the high rate of steel works engagement, to say

nothing of a marked scarcity of steel works grades of scrap and the consequent higher melt of pig iron, has given this kind of iron a value it did not recently have. Those who have supplies are not disposed to sell and those who are short of scrap want iron badly. This combination of circumstances usually produces just such a situation as the existing one. An Ohio steel company, which has not been able to get as much scrap as formerly on account of the diversion of Detroit supplies by water to Cleveland and Buffalo, has bought some iron against an inquiry totaling 15,000 tons. A few weeks ago it bought that amount from a Cleveland steel maker. Several other melters also are in the market for good-sized blocks. Two of the inquiries originated from Valley steel companies, which shortly will put out their own furnaces for repairs and relining and are anxious to accumulate reserve supplies. The strength of basic iron is individual, as prices of other grades have not been affected except sentimentally, and this is seen in higher asking prices rather than in actual sales prices. Foundry iron remains at \$17, Valley furnace, for the base grade, and the business of the week does not warrant a change in malleable and Bessemer grades. The Carnegie Steel Co. has put on one Clairton furnace, but will take one of that group off in the next week or 10 days. One of its Carrie furnaces also has resumed. The Pittsburgh Steel Co. and the Pittsburgh Crucible Steel Co. each has put on a furnace lately, and the Sharpsville furnace of the Davison Coke & Iron Co. was blown in Oct. 1. W. P. Snyder & Co. make the average price of Valley basic and Bessemer iron for September \$16.50 and \$17.20.

Prices per gross ton, f.o.b. Valley furnace:

Basic	\$17.00
Bessemer	\$17.25 to 17.50
Gray forge	16.50
No. 2 foundry	17.00
No. 3 foundry	16.50
Malleable	17.25 to 17.50
Low phos., copper free....	26.50

Freight rate to Pittsburgh or Cleveland district, \$1.76.

Semi-Finished Steel.—Fourth quar-

ter prices for billets, slabs and sheet bars are not yet fully established. While several mills have announced a basis of \$34, Pittsburgh, for 4-in. billets and equivalent area of slabs, with an extra of \$1 a ton for smaller sizes down to 1½ x 1½ in., there has been very little contracting to date, as the principal buyers—non-integrated strip manufacturers—have accumulated a considerable stock and seem disposed to use up these supplies before making fresh purchases. There is additional reason for delay in the fact that fourth quarter contracts for strip steel carry practically the same prices as those for the second and third quarters. Almost all makers of sheet bars have announced \$33, Pittsburgh, as the fourth quarter contract price, but acceptance by one or two makers of business for this period at the third quarter price indicates a range of quotations of \$32 to \$33. Forging quality billets for this quarter have been entered at \$38 by some makers, but others want \$39 and \$40, figuring an extra of \$5 or \$6 a ton over a base price of \$34 for rerolling billets. The new chemical extras are being applied and the need for a separate quotation for guaranteed analysis steel is thereby obviated. Wire rods are steady at \$42, base Pittsburgh and Cleveland. Mills have quite generally moved to a minimum of 1.90c. on pipe skelp; demand is only moderately active.

Bars, Plates and Shapes.—Makers in this territory start the final quarter of the year with a minimum price of 1.90c., base, on these products, and insist that this is the large-lot price, with buyers taking smaller tonnages paying \$1 or \$2 a ton more. In a general way, however, 1.90c. and 1.95c. are the prevailing prices, with 2c., base, being obtained only from very small buyers or for tonnages that are unattractive from a mill viewpoint. It is early for much specifying on fourth quarter contracts, because there are few buyers who have exhausted steel ordered on third quarter commitments. Demand for bars is heavy, and promptness of deliveries, to which buyers have long been accustomed, is not possible because almost all mak-

ers have three to four weeks' business scheduled. Structural shapes are moving well, but real activity is lacking in plates. Fabricated steel inquiry is reported good, and a feature is the large number of factory buildings in the pending business.

Rails and Track Supplies.—Current business is moderate in rails and track accessories, light-section rails and small spikes finding only a limited demand, but the annual rail buying movement has opened and the mills are expecting soon to have sufficient business to give standard-section rail mills full engagement throughout the winter.

Wire Products.—There is not much activity in nails, but other wire products appear to be moving steadily. Prices are well maintained, but reports that an advance was under consideration find no verification.

Tubular Goods.—The demand continues strong for seamless pipe for deep oil well drilling, and most makers are well supplied with pipe line business. In other directions, business is only moderately active, lapwelded oil country pipe being really slow, since there is not much drilling at present in the shallow well fields.

Sheets.—The interesting feature of the situation is the stronger price stand that most makers now are taking. Full order books have placed producers in an independent position, with respect both to prices and deliveries. It is no longer possible for buyers to place orders on a basis of deliveries to start within a week, as has been the case most of the year, and there are instances where the best promise is from three to four weeks. Price shading has not entirely disappeared, but on new business the mills generally are holding firmly to 2.75c., base, for black, 3.50c., base, for galvanized and 2c., base, for blue annealed. There still is some opposition to the lower rate of discount for cash, which became effective Oct. 1, but no evidence that the mills are yielding. A high rate of consumption is indicated by the fact that more than 90 per cent of the country's sheet making capacity is in operation.

Carbon Vanadium.....	0.95	3.70

Above prices are for hot-rolled steel bars, forging quality. The ordinary differential for cold-drawn bars is 1c. per lb. higher. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis. For billets under 4 x 4 down to and including 2½ in. squares, the price is \$5 a gross ton above the 4 x 4 billet price.

Slabs with sectional area of 16 in. or over carry the billet price; slabs with sectional area of 12 in. to 16 in. carry a \$5 extra above the billet price and slabs with a sectional area under 12 in. carry the bar price.

Band sizes are 40c. per 100 lb. higher.

Rails

Per Gross Ton

Standard, f.o.b. mill.....	\$43.00

Less carload, 4 points less. Add \$8 per net ton for more than four gages heavier than standard. No extra for lengths up to and including 24 ft. Sizes smaller than 1 in. and lighter than standard gage to be held at mechanical tubes list and discount. Intermediate sizes and gages not listed take price of next larger outside diameter and heavier gage.

Seamless Mechanical Tubing

Per Cent Off List

Carbon, 0.10% to 0.30%, base (carloads).....	55
Carbon, 0.30% to 0.40%, base.....	50
Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.	

Tin Plate.—The seasonal slump in demand and in mill operations is slighter than usual, owing to a good demand for general line tin plate and some export demands of fair size, which partly offset the loss of packers' can business. The general average of tin mill engagement is about 75 per cent of capacity, though some producers are running at a higher rate.

Cold-Finished Steel Bars and Shafting.—Makers now report free acceptance on the part of consumers of the \$2 a ton advance in prices on fourth quarter contracts. Little tonnage yet is moving at 2.20c., base, because third quarter contracts did not contain a clause making it necessary to have specifications in before the quarter ended. In fourth quarter contracts there is a stipulation that specifications must be in by Dec. 10.

Boiler Tubes.—Leading makers of welded steel boiler tubes have made a slight revision in prices of the larger sizes, effective Oct. 1. Heretofore, the card discount on sizes 4 in. to 14 in. has been 46 per cent; under the new method of quoting, sizes greater than 6 in. in diameter are discontinued and the old discount of 46 per cent applies to 4-in. to 4½-in. tubes, while for 5-in. to 6-in. tubes, a new discount of 40 per cent has been named. Roughly, this means an advance of \$12 a ton on the larger sizes, one point in the discount being approximately \$2 a ton. Supplementary discounts are the same as they have been for several months.

Hot-Rolled Flats.—September was a heavy month in strip specifications, and makers have order books sufficient to keep them busy most of this month. A recession in buying is expected this month, as it is believed that November automobile production will fall somewhat from the present rate. Prices are steady.

Warehouse Prices, f.o.b. Pittsburgh

	Base per Lb.
Plates	3.00c.

Common wire nails, per keg	3.00
Cement coated nails, per keg	3.05

Old Material.—The market has developed a fresh burst of strength in the steel works grades, chiefly as a result of a purchase by the Steel Corporation for one of its Pittsburgh district plants of about 20,000 tons of heavy melting steel at \$17. This sale seems to have established that grade at that price. No higher price has been obtained, but dealers seem unable to buy for any lower figure. The market also is stronger on compressed sheets, which have sold at as high as \$17. The events of the week have given a generally stronger tone to the entire market. Machine shop turnings are not salable at more than \$11.50, as the principal user, after buying at that price, withdrew from the market, and dealers with short orders do not appear willing to go above \$11 to cover. One mill in the district still is holding up shipments on orders, but the sustained rate of steel works operations is keeping up the demand for shipments generally, and dealers are finding it hard to cover their short sales. The October scrap list of the Baltimore & Ohio Railroad, which closes Oct. 8, contains 9575 gross tons.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:	
Heavy melting steel	\$17.00
Scrap rails	\$16.50 to 17.00
Compressed sheet steel	16.50 to 17.00
Bundled sheets, sides and ends	15.00 to 15.50
Cast iron carwheels	15.25 to 15.75
Sheet bar crops, ordinary	17.00 to 17.50
Heavy breakable cast	12.75 to 13.25
No. 2 railroad wrought	17.00 to 17.50
Heavy steel axle turnings	15.00 to 15.50
Machine shop turnings	11.00 to 11.50

Acid Open-Hearth Grades:	
Railr. knuckles and couplers	17.50 to 18.00
Railr. coil and leaf springs	17.50 to 18.00
Rolled steel wheels	17.50 to 18.00
Low phos. billet and bloom ends	20.00 to 20.50
Low phos., mill plates	18.50 to 19.00
Low phos., light grade	17.50 to 18.00
Low phos., sheet bar crops	18.50 to 19.00
Hvy. steel axle turnings	15.00 to 15.50

Electric Furnace Grades:	
Low phos. punchings	17.50 to 18.00
Hvy. steel axle turnings	15.00 to 15.50

Blast Furnace Grades:	
Short shoveling steel turnings	12.50 to 12.75
Short mixed borings and turnings	12.50 to 12.75
Cast iron borings	12.50 to 12.75
No. 2 busheling	11.25 to 11.75

Rolling Mill Grades:	
Steel car axles	18.50 to 19.50
No. 1 railroad wrought	12.50 to 13.00
Sheet bar crops	18.00 to 18.50

Cupola Grades:	
No. 1 cast	15.25 to 15.75
Rails 3 ft. and under	17.50 to 18.00

Cold-Rolled Strips.—All makers in this area are well supplied with business as a result of heavy September specifications. Average prices for the final quarter of the year will be higher than in the past two quarters, since producers were able to secure a slight advance from the large users.

Bolts, Nuts and Rivets.—Signed fourth quarter contracts are coming in well, and makers expect heavier specifications than in the past two quarters owing to the prospect of increased railroad demands. Prices are

holding well. Most makers of rivets are observing \$2.90, base, per 100 lb. on large sizes and 70 to 70 and 10 per cent discount for small rivets.

Coke and Coal.—The spot coke market still is very firm, but not quotably higher than in the past few weeks. The coal market is featured by a stronger situation in household grades, but the production of these grades means an excessive supply of slack, which is selling at very low prices.

Increased Rail Shipments This Quarter Forecast

WASHINGTON, Oct. 2.—Estimates of an increase of 7.3 per cent in carload shipments of iron and steel during the last quarter of the current year as against the corresponding period of 1927 have been made by the 13 Shippers' Regional Advisory Boards, according to the American Railway Association. The estimated carload shipments of iron and steel during October, November and December of the present year are 388,280, compared with 361,805 for the fourth quarter of last year. Other commodities included in the 29 which are expected to show increased shipments are coal and coke; ore and concentrates; castings, machinery and boilers; agricultural implements and vehicles, other than automobiles, and automobiles. The carload shipments of the 29 commodities estimated for the last quarter of 1928 are approximately 9,279,472 cars, an increase of 4.9 per cent or 431,599 cars.

Included in the estimated increases are the following:

	(In Carloads)		Per Cent Inc.
	Actual, 1927	Est., 1928	
Iron and steel ..	361,805	388,280	7.3
Coal and coke ..	3,033,956	3,157,032	4.1
Ore and concentrates ..	352,274	385,731	9.5
Castings, machinery and boilers	55,516	58,569	5.5
Agricultural implements and vehicles, other than automobiles ..	30,620	32,825	7.2
Automobiles, trucks and parts	152,150	197,116	29.6

The thirty-fourth annual meeting of the Ohio Valley Improvement Association at the William Penn Hotel, Pittsburgh, opened Tuesday evening, Oct. 2, with a banquet, at which there was not only a full attendance of the membership of the association, but a large representation of steel company executives interested in the development of the inland waterways for the shipment of their products. On Wednesday, the Jones & Laughlin Steel Corporation entertained the delegates at luncheon at the Chartiers Heights Country Club. Today (Thursday) visitors will be guests of the Carnegie Steel Co. on an inspection trip on the Monongahela River.

Steel Industry Now on Unusually Stable Basis—Backlogs Have Expanded—Price Situation Stronger

CHICAGO, Oct. 2.—The opening of the final quarter finds the steel business on an unusually stable basis. Forward contracting, which had lagged up to the last days of September, suddenly became active. Backlogs have expanded rapidly. Sales in the week brought the total for September well above the aggregate in August. Both specifications and shipments gradually expanded throughout September, so that deliveries in the third quarter exceeded by not less than 15 per cent the shipments in the second three months of this year. Specifications in the last week compare favorably with the best week so far this year, though at present it is notable that car tonnage is small and rail releases are not yet an important factor.

Prices for plates, shapes and bars are showing greater strength at 2c. to 2.10c. per lb., Chicago. Heavy purchases in the last few days indicate that buyers' resistance is lessening.

Deliveries, except in structural material, are being crowded further into the future. Shipments on most sizes of bars are now about five weeks.

Ingot output is a shade higher at 85 per cent of capacity. Pressure by purchasers for best possible deliveries and the tendency for users to plan schedules further in advance reflect the higher speed of industry and lay at rest the fear expressed by some that the fall steel market was becoming speculative and that users were building stocks beyond immediate requirements. In some instances consumers have been forced to carry larger stocks because delayed deliveries have made it necessary to keep on hand a more comfortable margin of steel.

Pig Iron.—The center of interest in this market lies in the accelerated rate of shipments. The melt in local and nearby foundries is expanding and insistence on prompt deliveries is more common. Malleable foundries producing a larger portion of light than of heavy castings are operating at close to capacity. Miscellaneous sales of charcoal iron are numerous, the aggregate of all orders being close to 1000 tons. Prices of this grade are steady at \$24, furnace. A local steel mill furnace that of late has been giving trouble and which may go down for repairs is producing some iron that is being offered through brokers.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25...	\$18.50
N'th'n No. 1 fdy., sil. 2.25 to 2.75...	19.00
Malleable, not over 2.25 sil.....	18.50
High phosphorus	18.50
Lake Super. charcoal, sil. 1.50.....	27.04
So'th'n No. 2 fdy. (all rail).....	22.26
Low phos., sil. 1 to 2, copper free	\$28.50 to 29.00
Silvery, sil. 8 per cent.....	29.79
Bess. ferrosilicon, 14-15%.....	46.79

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Ferroalloys.—Several carloads of spiegeleisen have been placed at \$33, Hazard, Pa. It is reported that a direct shipment of this commodity is now on the water bound from England to Chicago. Prices for ferro-

manganese are strong at \$105, seaboard.

Prices delivered Chicago: 80 per cent ferromanganese, \$112.56; 50 per cent ferrosilicon, \$83.50 to \$87.50; spiegel-eisen, 19 to 21 per cent, \$40.76.

Plates.—Specifications for plates continue to come from a wide variety of users and in a large aggregate tonnage. Car shops are operating at low capacity, but tank makers and fabricators of pipe from plates are busy. Closer control of oil well output is checking orders for tanks. One lot of 8000 tons for this purpose is still before the trade. Prices are steady at 2c. to 2.10c. per lb., Chicago.

Mill prices on plates, per lb.: 2c. to 2.10c. base Chicago.

Bars.—Soft steel bar mills in the Chicago district are operating within a point or two of capacity. Specifications have been unusually liberal this week, and deliveries for most sizes have been extended to five weeks, though some sizes can still be delivered in three weeks. Heavy releases have recently been made by drop forgers, while makers of cold-drawn bars are in need of larger quantities. From the viewpoint of Chicago producers of steel, there has been no let-down in the automobile industry as a whole. Ford is reported to have reached an output of 5300 cars a day. Current orders for rail steel bars are numerous at 1.95c. per lb., Chicago Heights. Specifications from barn equipment makers are smaller, but the bed industry is busier. Deliveries range from two to three weeks. Producers are asking \$1 to \$2 a ton more for iron bars. New buying is sluggish and specifications are small. Prices for alloy steel bars are firm, and specifications are steady. Fourth quarter contracts are about equal in tonnage to third quarter commitments.

Mill prices per lb.: Soft steel bars, 2c. to 2.10c., base, Chicago; common bar iron, 2c. to 2.10c., base, Chicago; rail steel bars, 1.95c., base, Chicago Heights mill.

Structural Material.—Orders for structural material total 6600 tons for the week. The bulk of this is for bridge work. The Great Northern has ordered 1900 tons, and a bridge at Grand Forks, N. D., takes 1200 tons. The American Bridge Co. will supply 2800 tons for a garage in Chicago. Fresh inquiries include 6000 tons for

miscellaneous bridge work. Competition among fabricators is keener, especially for large jobs. Demand for structural material is the lightest of the heavy tonnage steel products.

Mill prices on plain material, per lb.: 2c. to 2.10c., base, Chicago.

Rails and Track Supplies.—Among fresh inquiries for standard-section rails this week is 15,000 tons for the Canadian National. Several large railroads are said to have their 1929 programs mapped out and will make definite inquiry before the middle of the month. Users have ordered a few carloads of light rails. Miscellaneous track accessory orders total 6000 tons. The 12,000 to 15,000 tons needed by the Chesapeake & Ohio is still before the trade, according to reports here. Releases against recent rail purchases are liberal. Output remains unchanged. The Chesapeake & Ohio rail order for 45,500 tons, mentioned last week, was distributed as follows: 19,380 tons each to the Illinois and Inland steel companies and 6740 tons to the Bethlehem Steel Co.

Prices f.o.b. mill, per gross ton: Standard-section open-hearth and Bess. rails, \$43; light rails, rolled from billets, \$36. **Per lb.:** Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.15c.; angle bars, 2.75c.

Cast Iron Pipe.—The Glamorgan Pipe & Foundry Co. bid \$43 per ton, delivered, and the United States Cast Iron Pipe & Foundry Co. quoted \$44 on 2120 tons of 6, 8 and 12-in. pipe for Chicago. The freight rate from Birmingham to Chicago is \$8.20, bringing the low bid to \$32.08, Birmingham. On small tonnages, sellers are readily obtaining \$35 a ton, Birmingham, for 6-in. and larger diameters, and in several instances \$37 has been obtained. Though prices have not definitely risen to higher levels, dealers appear to be anxious to put in effect advances for average sizes and small tonnages. Sales are few in number and inquiries are scarce. Railroads and public utilities have ordered a few carloads.

Prices per net ton, deliv'd Chicago: Water pipe, 6-in. and over, \$42.20 to \$43.20; 4-in., \$46.20 to \$47.20; Class A and gas pipe, \$4 extra.

Sheets.—Prices remain strong, and some observers feel that advances are near at hand. Mill backlogs are heavy. Spot sales are numerous and afford a real gage of present prices. Hot mills are engaged at close to capacity, and specifications have been in such volume that deliveries have been extended to a range of three to four weeks. Shipments to barrel and light tank manufacturers are large, and the roofing trade is busy, now being in the midst of a very active fall season.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 2.80c. to 2.90c.; No. 24 galv., 3.65c. to 3.75c.; No. 10 blue ann'l'd, 2.15c. to 2.25c. Deliv'd prices at other Western points are equal to the freight from Gary plus the mill prices, which are 5c. per 100 lb. lower than Chicago delivered prices.

Bolts, Nuts and Rivets.—Specifications in September fell below the total in August, but consumers' stocks

seem now to have been reduced to a minimum, and, with greater industrial activity, there is a noticeable pickup in the total volume of releases against commitments. Agricultural implement manufacturers and the railroads are among those that are in need of larger quantities. Prices are steady.

Warehouse Business.—Effective Oct. 1, warehouses adopted a cash discount of one-half of 1 per cent on sheets and cold-rolled strip. Warehouses have dropped the extra of 10c. per 100 lb. on blue annealed sheets on gages No. 8 and No. 10 in widths of 40 in. and over.

Cold-Rolled Strip.—Business remains brisk at 2.75c. to 2.85c., base, per lb., Cleveland. Specifications are heavy and output is not far from the capacity of mills.

Old Material.—Heavy melting steel has moved up 25c. a ton and many other grades of scrap iron and steel are proportionately higher in price. For the most part, individual sales are smaller than might be expected with business as brisk as it is now, but buyers are moving cautiously and are not ready to admit that the market is as strong as pictured by dealers. This condition, however, has prevailed for several weeks, during which time the market has steadily moved upward. It is reported that brokers are paying as high as \$14 a gross ton, delivered, for heavy melting steel to be shipped against old obligations. Likewise, in cast iron borings and rerolling rails, dealers are paying prices that are 25c. to 50c. above the quotations on heavy tonnage sales. A steel mill has bought a round tonnage of borings at \$10.50 a gross ton, and late last week brokers were offering \$10.25 to cover old orders taken at \$10, delivered. Shipment of industrial scrap, especially from automobile manufacturing plants, is heavy. Foundries, including makers of malleable castings, are busy and their purchases of scrap are liberal, though for immediate requirements only. A broker is reported to have paid \$17.75 a gross ton for re-

rolling rails. This is about 75c. above prices said to have been paid by users. The recovery of the local scrap market is clearly indicated by the fact that billings by brokers in September were larger than in any previous month this year. Among railroad offerings this week are 40,000 tons by the Pennsylvania and 6000 tons by the Chicago & North Western.

*Prices deliv'd Chicago district consumers:
Per Gross Ton*

Basic Open-Hearth Grades:		
Heavy melting steel.....	\$13.25 to	\$13.75
Shoveling steel.....	13.25 to	13.75

Grate bars	12.25 to	12.75
Brake shoes	11.25 to	11.75

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Wire Products.—The jobbing business gives no indication of the lively trade that producers had expected during the early weeks of fall. Added to dullness in the Central States and in the Northwest is a slowing down of fence business in the South. The manufacturing trade, in contrast with business done with distributors, is unusually heavy, purchases in September having been larger than in any month this year. Fourth quarter contracting has moved rapidly in the last week, with the result that the bulk of requirements for the next three

months has been covered. It is noticeable that estimates of future requirements are more conservative than in the last quarter. Shipments from mills balance well with production, which now stands at 65 per cent of capacity.

Reinforcing Bars.—Among awards this week is 600 tons of billet steel reinforcing bars for construction work at Stickney, Ill. Lettings are more numerous in sizes from 50 to 200 tons and dealers' order books are growing. Some shops are engaged at close to capacity, with the outlook favorable for steady output well through October. Contractors are rushing jobs that are under way and requests for prompt shipments are insistent. Prices again have turned to the weak side. Efforts to advance rail steel reinforcing bars \$2 a ton are meeting with strong resistance. Billet steel bars out of Chicago warehouse have touched a new bottom at 2.15c. a lb. for lots of 100 tons and more. Quotations on smaller business are proportionately lower.

Coke.—Shipments of by-product foundry coke remain heavy, and prices are firm at \$8 a ton, f.o.b. local ovens. All ovens in this district are lighted.

Index to Wholesale Prices

Revised index numbers of wholesale prices, using 1926 as a basis of 100 and giving monthly figures for the principal groups of products and sub-groups, from the beginning of 1913 to the middle of 1928, have been published by the United States Bureau of Labor Statistics. The pamphlet covers 32 pages of tables, with one introductory page. In extending these numbers back to 1913, allowance was made for variations in the importance of commodities as developed year by year.

The United States Treasury Department has filed a brief appealing the decision early this year by Justice Fischer, sitting in the Customs Court, that reinforcing bars should be classified as structural material taking a duty of 20c. per 100 lb. instead of as bars with a duty of 30c. per 100 lb. A brief has also been submitted to the Customs Court of Appeals by attorneys for the defendant in the litigation, Henry L. Exstein Co., 233 Broadway, New York, and a court hearing is expected some time next month.

The American Sheet & Tin Plate Co. has started on a program of betterments at its Vandergrift, Pa., works, the principal part of which is in expanding the annealing capacity of the plant and the addition of normalizing furnaces. An old warehouse is to be razed to provide space for the new furnaces. Annealing capacity has been inadequate at this plant and the plans of the company call for the doubling of the present capacity.

Philadelphia

New Steel Contracts Show \$2 Advance to Consumer— Heavy Melting Steel 50c a Ton Higher

PHILADELPHIA, Oct. 2.—Most of the steel being shipped is evidently destined for immediate or early consumption, so that very little material is accumulating in stocks. This is also true of pig iron and iron and steel scrap. In the last week of September, specifications against third quarter steel contracts were heavy and there was substantial contracting for bars and plates for this quarter, in practically all cases at a \$2 a ton advance to the buyer, based on the price of his previous contract. Structural shapes are firmer at 2.05c., Pencoyd, Pa. Sheet mills have specifications on their books sufficient to occupy them for the next six weeks and have apparently succeeded in applying the new discount of one-half of 1 per cent for cash in 10 days, although the 2 per cent discount will appear on a large percentage of invoices this month, as specifications were furnished by the buyers prior to Oct. 1.

Pig Iron.—Except for purchases of carload or 100-ton lots of foundry iron, the market is inactive. Consumers, however, are in most cases pressing for prompt deliveries against their contracts and evidently are using iron as rapidly as it is received. Furnace stocks are also decreasing, and it is estimated that in the Buffalo district furnace stocks have in the past three months been reduced fully 125,000 tons. This is attributed in part to shipments to consumers, but also to increased use of their own iron by steel company producers. Eastern Pennsylvania furnaces are comfortably booked with tonnage and are maintaining a \$20 base, furnace, on foundry grades. On Sept. 28 the Brooke furnace at Birdsboro, Pa., was blown in, having been out of blast since May 1 for rebuilding. Low phosphorus demand is fair; the northern New York producer, which recently went out of blast, is reported to have considerably reduced its stock at the furnace.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to	
2.25 sil.	\$20.76
East. Pa. No. 2X, 2.25 to	
2.75 sil.	21.26
East. Pa. No. 1X.....	21.76
Basic (del'd east. Pa.)....	\$19.00 to 19.25
Gray forge.....	19.75 to 20.25
Malleable.....	21.00 to 21.50
Stand. low phos. (f.o.b.	
N. Y. State furnace)....	22.00 to 23.00
Cop. br'g low phos. (f.o.b.	
furnace).....	23.00 to 23.50
Va. No. 2 plain, 1.75 to	
2.25 sil.	24.54
Va. No. 2X, 2.25 to 2.75 sil.	25.04

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to \$1.64 from eastern Pennsylvania furnaces; \$4.54 from Virginia furnaces.

Ferromanganese.—Consumers are requisitioning heavily on current contracts. The price is unchanged at \$105 per ton, seaboard, the quotation of domestic producers and importers. The advance last week of \$5 a ton in the price quoted for export by British producers was apparently applied only to European markets, as importers here have received no notice of a price revision.

Billets.—Some mills are asking \$34 per ton for small lots of rerolling quality, but on a substantial tonnage \$33 per ton, Pittsburgh, for rerolling and \$38, Pittsburgh, for forging quality are still available quotations.

Bars.—Contracting for fourth quarter delivery is reported to have been

heavy, particularly in the past week. Mills are generally booked with tonnage sufficient to occupy them for the next four to six weeks. In most cases, contracts have been made at \$2 a ton advance to the consumer. Buyers who have been receiving deliveries on contracts at 1.80c., Pittsburgh, have made new commitments at 1.90c., Pittsburgh, and those with 1.85c. per lb. contracts for third quarter, have bought for the remainder of the year at 1.95c., Pittsburgh. Small lots are bringing 2c., base Pittsburgh, so that the range for Philadelphia delivery is quotable at 2.22c. to 2.32c. per lb.

Shapes.—Prices are beginning to show more stability with the new quarter, as it is generally understood that contracts at 1.90c. and 1.95c. per lb., Pencoyd, Pa., terminated with September. Mills are now asking 2.05c., Pencoyd, as a minimum. Fabricating shops are well occupied with tonnage and maintaining a better level of prices on recent bids.

Plates.—Consumers exhibited but little interest in last quarter contracts until the final week of the quarter, when a good volume of new business was booked at advances of \$2 a ton, prices ranging from 2.05c., Coatesville, to large or preferred buyers, to 2.15c., Coatesville, on small tonnages. The average contract price has been 2.10c., Coatesville, or 2.20c., delivered Philadelphia.

Sheets.—Sheet mills which permitted customers to specify against third quarter contracts up to the last day of September received very heavy shipping orders last week. In addition, there was a considerable amount of contracting for the fourth quarter at the new prices, which are 2.75c. for black, 3.50c. for galvanized and 2c. for blue annealed, Pittsburgh base. The extra of 10c. per 100 lb. for widths of blue annealed greater than 45 in. is evidently being much more firmly adhered to by the mills than was true in the third quarter. Although a considerable portion of the sheet shipments this month will take the 2 per cent cash discount, the new discount of one-half of 1 per cent is now in effect on all specifications received on or after Oct. 1.

Old Material.—Prices on most grades have become steadier. Mills are receiving sufficient scrap for their present requirements. A Harrisburg user has bought stove plate at \$13, yard steel at \$13 and heavy breakable cast at \$17, and is now offering 50c. a ton less than these prices. No. 1 steel has been bought by a Claymont, Del., consumer at \$16 a ton, a 50c. a ton advance from the last previous purchase price of the same buyer. The largest eastern Pennsylvania consumer of heavy melting steel is reported to have closed on a tonnage recently, but no price is named. The situation in low phosphorus scrap, couplers and knuckles and rolled steel wheels renders it difficult to determine the price to a consumer. One large producer of low phosphorus has recently refused to sell at \$20 a ton, yet brokers say that there is no consumers' market at present. A similar situation exists in the market on steel wheels and couplers and knuckles.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel.....	\$16.00

Steel rails for rolling.....	15.50 to 16.00

Warehouse Business.—Jobbers report a fair volume of buying, and prices are quite firm. September was a fair month. The size of orders for all products is beginning to show improvement, which jobbers attribute to the well-filled condition of the mills.

Imports.—In the week ended Sept. 29, pig iron arrivals at this port totaled 2477 tons, of which 2075 tons was British and 402 tons was Dutch iron. A total of 271 tons of iron ore was received, 261 tons from Spain and

10 tons from the United Kingdom; 4768 tons of manganese ore came in from British West Africa. Steel arrivals consisted of 146 tons of structural shapes from Germany and 122 tons of steel bars from Sweden.

Cleveland

Heavy Specifications at Close of Third Quarter and New Contracting Produce Added Strength

CLEVELAND, Oct. 2.—Heavy specifications for steel bars, structural material and plates came out during the last few days of September against third quarter contracts. With higher prices prevailing for this quarter, very little tonnage was left unspecified on expiring contracts. Some of the local sales offices report that the tonnage entered in September broke previous records of the year, with the exception of one month. A goodly number of fourth quarter contracts were taken during the week at \$2 a ton above the prices the same consumers paid in the last quarter. Many of these were closed at 1.90c. to 1.95c., Pittsburgh, for steel bars, plates and structural shapes, with some at 2c., although the higher price usually applies to small buyers of miscellaneous lots who are not likely to contract.

A local mill has announced that it will hold to the Pittsburgh mill price for steel bars for the fourth quarter, using Cleveland as a basing point. However, some local consumers have been able to contract for the fourth quarter at 1.85c., Cleveland. Outside mills, using Cleveland as a basing point on steel bars, are naming 1.95c. to 2.05c., Cleveland. Some of the plate consumers are buying only for current needs, not being fully convinced that present prices will hold.

Specifications from the automotive industry are holding close to the recent volume. Several of the motor car companies are sounding out the market with inquiries for first quarter prices for sheets and hot-rolled strip steel. The Chevrolet Motor Car Co. is in the market for stampings for its new models for deliveries extending through the first quarter, and some of the stamping plants that are figuring on this work are asking for prices on blue annealed sheets for deliveries extending over six months, but mills are not ready to make quotations that far ahead.

The Wheeling & Lake Erie Railroad has purchased 1000 tons of rails from the Carnegie Steel Co.

Pig Iron.—Several inquiries for foundry and malleable iron totaling 20,000 tons or more came out during the week. An Indiana melter asked for 6000 tons and a Michigan foundry for 3000 tons, both wanting malleable

grades. One producer may open its books this week for the first quarter at a 50c. a ton advance over the current market price. Others have not yet given consideration to first quarter prices. Sales for this quarter continue to taper off. Cleveland interests booked 26,500 tons during the week. Foundries are pretty well covered for the remainder of the year, and it is expected that additional buying will be mostly in small-lot orders from consumers who will need more iron or from those who buy from hand to mouth. The only change in the price situation on foundry and malleable grades is a firmer tone in the Michigan market, where there has been a spread of from \$18 to \$18.50. The lower price has disappeared. For outside shipment, Cleveland furnaces quote foundry and malleable iron at \$17.50. Interest in the basic market has been stirred by two inquiries. One of these from the Central Alloy Steel Corporation is for 15,000 tons for October-November shipment. Both prospective buyers were unable to find a producer who would sell basic at \$17. Cleveland furnaces have no basic to sell, but one Valley producer stated that it might make a sale at \$17.50. The last basic sale was at \$16.25. Shipping orders are holding up to recent volume, and there is no sign of a slowing down in the demand from the automotive industry.

Prices per gross ton at Cleveland:

N'th'n fdy., sil.	1.75 to 2.25	\$18.50
S'th'n fdy., sil.	1.75 to 2.25	22.25
Malleable		18.50
Ohio silvery, 8 per cent.		28.00
Basic Valley furnace		17.00
Stand. low phos., V'ley fur.	\$26.50 to	27.00

Prices, except on basic and low phosphorus, are delivered Cleveland. Freight rates: 50c. from local furnaces; \$3 from Jackson, Ohio; \$6 from Birmingham.

Sheets.—A fair amount of business has been taken at regular prices, both in orders for early shipment and in fourth quarter contracts. Good order books are helping to strengthen the price structure, as some of the

mills are four weeks behind on deliveries on black sheets and six weeks behind on auto body sheets. Black sheets appear well established at 2.75c., Cleveland. Blue annealed sheets, on which there has been some shading, are now holding rather firmly at 2c. No price deviation is reported on galvanized sheets, although these have not been well tested.

Semi-Finished Steel.—A local producer has sold 1500 tons of billets at \$34, Cleveland, for the fourth quarter, and it is expected that this price will be definitely established, with sheet bars \$1 a ton lower. Consumers are still taking heavy shipments against \$32 and \$33 contracts.

Wire Products.—Many consumers have covered for the fourth quarter at the regular quotations, which are being maintained by leading producers. However, there is price shading in some sections. Manufacturers' wire is in heavy demand.

Reinforcing Bars.—Inquiry has improved. Rail steel bars have been advanced \$2 a ton to 1.85c., mill. Some jobbers have advanced the stock price to 2.25c., Pittsburgh, or 2.44c., Cleveland.

Warehouse Business.—Cleveland jobbers on Oct. 1 advanced warehouse prices \$2 a ton on black and galvanized sheets. Other prices are unchanged. Warehouse business is good.

Iron Ore.—Shipments of Lake Superior ore by water during September amounted to 8,748,286 tons, a gain of 1,518,245 tons over those of the same month last year. The total movement up to Oct. 1 was 41,265,979 tons, or a decrease of 1,117,978 tons, compared with the same period last year. September shipments fell off about 500,000 tons compared with August. Present indications are that the movement for the season will be quite a little ahead of last year's.

Coke.—Domestic by-product coke is moving in good volume at \$4.50, Ohio ovens, for egg size. There is not much activity in foundry coke, which is unchanged at \$7.75, Painesville, for Ohio by-product coke and at \$3.50 to \$4.85, ovens, for Connellsville coke.

Bolts, Nuts and Rivets.—Specifications for bolts and nuts are fair from practically all consuming industries, as well as from jobbers. September orders fell slightly below those of August, during which the volume was unusually good for a summer month. The industry is operating at 60 to 65 per cent of capacity. Rivet orders are moderate.

Strip Steel.—Specifications for hot-rolled strip continue to come out in good volume, but there is little new business, as all except the very small consumers are covered at the third quarter prices. Mills have taken quite a few fourth quarter contracts for cold-rolled strip at 2.75c., Cleveland and Pittsburgh, and the market now appears well established at that

Warehouse Prices, f.o.b. Cleveland

	Base per Lb.
Plates and struct. shapes	3.00c.

Com. wire nails, base per keg	2.85

*Net base, including boxing and cutting to length.

price. Some small-lot business is being taken at 2.85c.

Old Material.—The market is very firm and several grades have advanced. To cover on short orders, dealers are paying the maximum prices that have prevailed recently. A Youngstown mill is reported to have bought No. 1 heavy melting steel at \$16, and dealers are offering up to \$15.75, delivered, to cover against this order. There have been some transactions in No. 2 heavy melting steel at \$13 to \$13.25. Machine shop turnings have advanced 50c. a ton. For this grade, dealers are paying \$9.50, delivered Cleveland, and \$11.50, delivered Youngstown. Cast scrap has also advanced 50c., a round lot bringing \$17 locally. Dealers are paying \$10.50 for blast furnace scrap. The scrap offered by Michigan automobile companies last week brought good prices. As the Pittsburgh market on heavy melting steel is \$1 a ton higher than the Valley market, while the Youngstown district has only a 50c. a ton advantage in freight rates from Detroit, scrap from the

latter city is moving more heavily to Pittsburgh than to Youngstown.

Prices per gross ton delivered consumers' yards:

New York

Steel Bids to Railroad Show Strength of Prices— Pig Iron Market Quiet

NEW YORK, Oct. 2.—The pig iron market is quiet, reflecting the fact that most of the larger buyers have placed contracts for the current quarter. In line with their recent announcement of an advance for first quarter, some Buffalo producers have introduced a clause in fourth quarter contracts stipulating that iron not shipped by Jan. 1 will be marked up 50c. a ton. A current inquiry calls for 500 tons for delivery in the first quarter, but otherwise there are no evidences of interest in iron for that period. Business, for the most part, consists of relatively small tonnages for early shipment. Sales in this district during the week totaled about 8500 tons. Stocks on furnace banks have been reduced, and in some cases certain grades of iron are not available for prompt delivery. The movement of wheat on the State barge canal has passed its peak, and a larger amount of pig iron is moving by water. The season is so late, however, that it is doubtful whether Buffalo producers will succeed in piling much stock iron at New Jersey ports. Buffalo foundry iron is unchanged at \$17, base furnace.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil.	1.75	
to 2.25.....		\$21.91
*Buf. No. 2, del'd east.		
N. J.		20.28
No. 2, del'd east. N. J.

1.75 to 2.25.....	20.89 to	22.02
East. Pa. No. 2X fdy., sil.		
2.25 to 2.75.....	21.39 to	22.52
East. Pa. No. 1X fdy., sil.		
2.75 to 3.25.....	21.89 to	23.02

Freight rates: \$4.91 from Buffalo, \$1.39 to \$2.52 from eastern Pennsylvania.

*Price delivered to New Jersey cities having rate of \$3.28 a ton from Buffalo.

Reinforcing Bars.—The Jones & Laughlin Steel Corporation has booked 1400 tons for an automobile garage and service station in Manhattan. Other sizable awards during the week were 850 tons for a causeway at Jones Beach, L. I., to E. T. Edwards; 550 tons for a barracks on Governor's Island, to Igoo Brothers, and 500 tons for two sections of the subway and 340 tons for a dam at Albany, N. Y., to the McClintic-Marshall Co. The activity of the market was prompted by a \$2 increase in price which became effective Oct. 1. For shipment from mill, distributors are now quoting 2c., Pittsburgh, and are adhering to the policy of shipping only in 40, 50 and 60-ft. lengths. On shipments cut to length the general quotation is 2.25c., Pittsburgh mill warehouse, or 2.59c., on cars at New York. Out of New York warehouse, prices are unchanged at 2.80c. per lb. for lots of 5 tons or more, 2.95c. for lots of 2 to 5 tons, and 3.24c. for less than 2 tons, all delivered at job.

Ferroalloys.—Sales of 200 to 300 tons of ferromanganese are noted at \$105, seaboard, together with transactions in spiegeleisen of several carloads and small lots at unchanged prices. British agents of ferromanganese producers have not been notified of any advance in this market.

Plates, Shapes and Bars.—At the opening of bids today (Tuesday) by the New York Central Railroad on its fourth quarter requirements, there was a general adherence among bidders to the prices that have recently been reported as covering the range which the steel mills are asking in-

dustrial users of steel for the remainder of the year. The Carnegie Steel Co. quoted 1.90c., Pittsburgh or Youngstown, on plates, shapes and bars for delivery to points west of the Buffalo district, while for Eastern shipment its quotation was 2c., West Seneca, N. Y. The Otis Steel Co. quoted 1.90c., Cleveland, on plates, and the Corrigan-McKinney Steel Co. and the Bourne-Fuller Co. quoted 1.90c., Cleveland, on bars, while the Republic Iron & Steel Co. named 1.90c. at Youngstown on bars. Laughlin Steel Corporation quoted 2c., Pittsburgh, on all three products; the Bethlehem Steel Co.'s price was 2c., West Seneca, N. Y.; the Youngstown Sheet & Tube Co.'s quotation was 2c., Youngstown. The Donner Steel Co. quoted 2c., Buffalo, on bars. Eastern plate mill quotations varied, the Lukens Steel Co. asking 2.10c., Newberry Junction, the Central Iron & Steel Co., 2.05½c., Newberry Junction, or 2.12½c., West Albany, and the Alan Wood Iron & Steel Co.'s price was 2.18½c., Newberry Junction. Chicago mills quoted 2.05c., mill, on all three products, while the Granite City Steel Co. put in a price of 2c., mill, on plates. These prices were generally from \$1 to \$3 a ton higher than were quoted on the New York Central's inquiry for third quarter. During the past week, a good deal of fourth quarter contracting has been done, with prices ranging from 1.90c. to 2c., Pittsburgh, on bars; from 2.22½c. to 2.32½c., New York, on plates, and from 2.19½c. to 2.29½c., New York, on shapes. Mills which permitted customers to specify against third quarter contracts up to the last day of September received very heavy specifications last week. Most of the Eastern plate mills fixed no time limit for specifications, and they were among those which received large shipping orders last week, some buyers specifying as much as 2000 tons for stock. Although Dec. 10 or 15 is the time limit for specifications for bars and shapes in fourth quarter contracts, some of the plate mills will permit specifying up to Dec. 25.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.24c. to 2.34c.; plates, 2.22½c. to 2.32½c.; struc. shapes, 2.19½c. to 2.22½c.; bar iron, 2.14c.

Cast Iron Pipe.—Orders for pressure pipe seldom exceed 100 tons, and most of the buying is limited to car-load lots or less. Even the large privately owned public utility companies are buying a few hundred tons of pipe at a time. One such corporation, which buys in New York, closed last week on about 250 tons of water pipe. Prices continue at about \$35.60 to \$36.60 per net ton, delivered New York, the quotation of Northern makers, and at \$36 to \$37 per ton, base Birmingham, the price of Southern foundries. The State of New York is inquiring for 168 tons of 6-in. to 30-in. Class A pipe for shipment to an institution at Orangeburg, N. Y. The State of Massachusetts is in the market for about 350 tons of 6-in., 8-in. and 10-in. Class B pipe for Waverly, Mass.

Prices per net ton, deliv'd New York: Water pipe, 6-in. and larger, \$35.60 to \$36.60; 4-in. and 5-in., \$40.60 to \$41.60; 3-in., \$50.60 to \$51.60; Class A and gas pipe, \$4 to \$5 extra.

Sheets.—Sales of black and galvanized sheets in lots ranging from 100 to 300 tons have been made within the past few days at the new prices, namely 2.75c., Pittsburgh, for black and 3.50c. for galvanized. Some buyers evidently had overstayed the market in the expectation that the \$2

advance on black and galvanized would not become effective. Mills have such large backlogs that they are not interested in orders at less than the new prices, which seem to be firmly established. In blue annealed sheets, an indication of the stronger position taken by producers is the almost uniform insistence on an extra of 10c. per 100 lb. on widths exceeding 45 in., whereas in the third quarter this extra was frequently waived.

Warehouse Business.—Jobbers report an increase in the size of individual orders, especially in structural steel and bars, users evidently being unable to obtain early deliveries from the mills. Black, galvanized and blue annealed sheets are firmer in price, a reflection of the well-filled condition of mills. One large jobber in this district has recently shipped about 200 tons of galvanized and black sheets to Porto Rico, where immediate shipment for use in reconstruction work was a factor. September business was considerably in excess of that done in August, and the month ranked favorably with earlier months of the year.

Coke.—Standard furnace coke continues firm, producers quoting from \$2.85 to \$3 per ton, Connellsville. Standard foundry coke is quoted at \$3.75 per ton, Connellsville, for ordinary grades and special brands are unchanged at \$4.85 per net ton, ovens. Delivered prices of special brands are \$8.56 per ton to northern New Jersey and Newark, and \$9.44 to New York and Brooklyn. By-product foundry coke prices are \$9 to \$9.40, Newark or Jersey City, and \$10.06, New York or Brooklyn.

Old Material.—No. 1 heavy melting steel is now being bought at \$14.50 to \$15.50 per ton, delivered eastern Penn-

sylvania, the lower price being for shipment to Bethlehem, Pa., and the higher quotation on tonnages for Coatesville, Pa., and Claymont, Del. Yard grade ranges from \$11.75 per ton, delivered Pottsville, Pa., to \$13 per ton, delivered Conshohocken, Pa. Brokers buying blast furnace scrap have advanced buying prices to \$10 per ton, delivered. Foundry grade of stove plate is being bought at \$12 per ton, delivered to a consumer at West Mahwah, N. J. Most eastern Pennsylvania consumers of scrap are better supplied than a fortnight ago, and in one instance a mill has temporarily reduced its offering price for heavy breakable cast, stove plate and yard steel by 50c. a ton, having received on old contracts a heavy tonnage of material, which will require several days to unload and pile.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel.	\$11.50 to \$12.00
Heavy melting steel (yard)	8.00 to 9.50
No. 1 hvy. breakable cast.	12.50 to 13.50
Stove plate (steel works).	8.75 to 9.00
Locomotive grate bars....	9.25 to 9.75
Machine shop turnings....	7.50
Short shoveling turnings..	7.50
Cast borings (blast furn. or steel works)	6.50 to 7.50
Mixed borings and turnings	6.75 to 7.25
Steel car axles.....	18.00 to 18.50

Cast borings (chemical)...	11.25

Prices per gross ton, deliv'd local foundries:

No. 1 machy. cast.....	\$16.50
No. 1 hvy. cast (columns, bldg. materials, etc.)	14.50
cupola size	
No. 2 cast (radiators, cast boilers, etc.)	14.00

Railroad Equipment

Canadian National Inquires for 1500 Box Cars

PURCHASE of 35 locomotives by the Canadian National, in addition to the 20 mentioned last week, and an inquiry from this road for 1530 freight and 43 passenger cars featured the equipment market during the week. Other inquiries included 500 underframes for the Great Northern and from 200 to 400 tank cars for the Union Tank Line. Details of the week's business follow:

Canadian National has distributed orders for 55 locomotives as follows: 20 4-8-4 Northern type to American Locomotive Co. through Montreal Locomotive Works, Ltd., as mentioned in THE IRON AGE last week; 10 eight-wheel switching locomotives to Montreal Locomotive Works, Ltd.; 15 Santa Fe type and 10 eight-wheel switching to Canadian Locomotive Co. Road has made additional inquiry for five locomotives of modified design Mountain type, and also expects

to buy 1500 box and 30 tank cars, 25 first-class coaches, 16 sleeping cars and two combination baggage and smoking cars.

Central Vermont has ordered two 2-10-4 type locomotives from American Locomotive Co.

Illinois Terminal Co. is inquiring for one Mikado type locomotive.

Denver & Rio Grande Western has made inquiry for four dining cars.

American Railroad of Porto Rico has ordered 100 cane cars from Gregg Co., Ltd.

Freeport Sulphur Co., New York, is inquiring for 15 steel hopper car bodies.

Great Northern is inquiring for 500 underframes in addition to 2000 recently placed with its own shops.

New York, New Haven & Hartford has ordered 10 transformer cars from Osgood-Bradley Car Co.

Union Tank Line is inquiring for 100 to 200 10,000-gal. tank cars and 100 to 200 6500-gal. tank cars.

Cerro de Pasco Copper Corporation, New York, has ordered 20 freight cars from American Car & Foundry Co.

San Francisco

Oil Tank Awards Take 3000 Tons of Plates — Structural Lettings of 4000 Tons

SAN FRANCISCO, Sept. 29 (*By Air Mail*).—Among the developments in the iron and steel markets on the Pacific Coast this week was the placing of over 3000 tons of plates and 4000 tons of structural shapes. The plates were for oil storage tanks for the Shell Oil Co. and the Rio Grande and Barnsdall oil companies.

Pig Iron.—Movement of foundry pig iron continues limited to small lots, and no large inquiries have come up for quotations recently. No change in quotations is noted.

Prices per gross ton at San Francisco:

*Utah basic	\$25.00 to \$26.00
*Utah fdy., sil. 2.75 to 3.25	25.00 to 26.00
**Indian fdy., sil. 2.75 to 3.25	24.00 to 25.00

*Delivered San Francisco.

**Duty paid, f.o.b. cars San Francisco.

Bars.—Only two awards of reinforcing steel bars exceeding 100 tons were reported. The largest letting involved 500 tons for the India Basin power plant of the Great Western Power Co., San Francisco, and was placed with the Pacific Coast Steel Co. New inquiries include 575 tons for buildings at Fort Lewis, Wash. An award is expected next week on 1800 tons for a college building at Berkeley. Importations in June totaled 2487 tons.

Plates.—The feature of the plate market this week was the award of five 80,000-bbl. tanks, involving 1550 tons, for the Rio Grande and Barnsdall oil companies, Santa Barbara, Cal., to McClintic-Marshall Co. and five 80,000-bbl. tanks, calling for a like tonnage, for the Shell Oil Co. at Martinez, Cal., booked by the Western Pipe & Steel Co. Pending tankage business includes 10 80,000-bbl. tanks for the Shell Oil Co. at Domingues, Cal., involving 3100 tons, and 5000 tons for 14 82,000-bbl. tanks for the General Petroleum Corporation, Los Angeles. Bids are to be opened Oct. 10 on 1200 tons for a pipe line at Hood River, Ore. No change in prices is noted, 2.20c. to 2.25c., c.i.f., representing the market.

Shapes.—Bookings of structural material were heavy this week and included 1200 tons for the Richfield Oil Building, Los Angeles, placed with the Llewellyn Iron Works, 550 tons for a factory addition at Tacoma,

Wash., 725 tons for a warehouse at San Diego, and 325 tons each for two apartments in Los Angeles. McClintic-Marshall Co. was low bidder on 2500 tons for a mill building at Pittsburg, Cal., for the Columbia Steel Corporation. Pending business exceeds 10,000 tons and includes 2000 tons for a power plant at San Francisco for the Great Western Power Co. and 2000 tons for a department store in Los Angeles. Imports during June totaled 1455 tons. No change in prices on plain material is noted, 2.35c., c.i.f., being firm.

Cast Iron Pipe.—A lull in demand

for cast iron pipe developed in the week. The American Cast Iron Pipe Co. took 200 tons of centrifugal pipe for Fifty-first Avenue N. E., Seattle, and the United States Cast Iron Pipe & Foundry Co. secured 212 tons for the Hamford Street sewer tunnel in Seattle. Bids were opened this week on 142 tons of 4 to 14-in. Class B pipe for Oxnard, Cal. No new inquiries developed. In June, 1231 tons was imported.

Steel Pipe.—Demand for oil country goods, especially oil well casing, continues unabated and pipe mill representatives report a better movement of standard steel pipe. Importations of tubular products in June totaled 2169 tons.

Coke.—Sales and inquiries for foundry coke are light and have involved small tonnages. Importations in June totaled 4901 tons.

St. Louis

Steady Buying of Pig Iron—Steel Mills in Strong Position —Scrap Prices Make Further Gains

ST. LOUIS, Oct. 2.—Buying of pig iron continues at a moderately heavy rate, and the market is firm at unchanged prices. The St. Louis Gas & Coke Corporation sold 5000 tons, including 2000 tons of basic iron and 500 tons of foundry, to local melters for prompt shipment, the remainder being for fourth quarter delivery. The leading Southern maker sold 1000 tons, including 400 tons to a specialty maker in the district, for shipment in the remainder of the year. An Iowa wheel manufacturer took 1000 tons of foundry iron, two implement manufacturers each took 300 tons of foundry iron, and a California melter bought 300 tons of malleable from the Granite City maker. Implement manufacturers are enjoying a heavy melt, as are jobbing foundries catering to agricultural lines. Stove plants are making heavy shipments, and are busy on new work.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25, f.o.b. Granite City, Ill.	\$19.50 to \$20.00
N'th'n No. 2 fdy., deliv'd St. Louis.	20.16
Southern No. 2 fdy., deliv'd.	20.67
Northern malleable, deliv'd.	20.16
Northern basic, deliv'd.	20.16

Freight rates: 81c. Granite City to St. Louis; \$2.16 from Chicago; \$4.42 from Birmingham.

Coke.—Colder weather has greatly stimulated the sale of domestic coke to dealers, and there is generally a better feeling in this field. Buying of foundry grades continues on an immediate need basis.

Finished Iron and Steel.—The Laclede Steel Co. and the Missouri Rolling Mills Corporation have advanced the price of reinforcing bars \$2 a ton. An advance of \$2 a ton on plates, shapes and bars also was effective on Oct. 1. Mills have accumulated a heavy backlog of orders for galvanized sheets as a result of the

rush to buy before the discount rate on these items was cut from 2 per cent to one-half of 1 per cent, and purchasing has stopped abruptly. Specifications for other products are satisfactory. Business with structural fabricators is quiet.

Old Material.—Further advances were made in prices of some items of old material during the week, and the whole list is strong. While there was very little buying by consumers, it is known that several mills are in need of scrap and will buy as soon as they and the dealers get together on prices. Dealers are short of some items, and further strength is given to the market here by improved conditions elsewhere. Miscellaneous standard section rails, railroad springs, machine shop turnings, No. 1 machinery cast and No. 1 railroad cast are 50c. higher; bundled sheets and stove plate are up 75c., and steel car axles are 25c. up. Railroad lists: Pennsylvania Lines, 43,120

Youngstown

Steel Mills Well Supplied With Business

YOUNGSTOWN, Oct. 2.—Steel makers are so well supplied with business and are so definitely committed on production for the next 30 days that it is becoming difficult for buyers to interest them in additional tonnage except at the full fourth quarter prices. The quotations for the final quarter represent substantial advances in most finished products over those which have prevailed in the quarter just concluded and which are the bases of the bulk of the business now on the books for shipment this month.

On sheets, all makers in this area now are firm on new business at 2.75c., base, for black, 3.50c., base, for galvanized and 2c., base, for blue annealed. Strip prices for the remainder of this year are the same as those ruling during the second and third quarters on hot-rolled, but on cold-rolled an advance of \$2 a ton has become well established, with the large lot price 2.75c., base, compared with 2.65c. in the third quarter. Fourth quarter contracts for steel bars have been entered at 1.90c., 1.95c., and 2c., base, prices having been determined by what the individual buyers paid on third quarter contracts. These prices are \$2 a ton higher than those of the previous quarter.

However, it will probably be another month before the higher prices begin to become effective in invoices, because it was not possible to shut off specifications entirely on the heavy rolled products on third quarter contracts until the last day of September.

Sheet mill bookings include considerable tonnage entered as third quarter business for shipment at convenience of the mill, which will be an obligation on this quarter's production. There will be improvement in the mill net prices on sheets, however, as every maker is firm in the plan for the lower discount for cash. On the base gages of sheets, the discount on galvanized sheets falls from 7c. per 100 lb. to 1.75c. at 3.50c., base; on black from 5.50c. per 100 lb. to 1.37½c. at 2.75c., base, and on blue annealed from 4c. to 1c. per 100 lb. on a base price of 2c.

Strictly new business is not heavy, but high mill engagement is not dependent upon active new buying in the presence of large obligations, and the insistence of consumers on very prompt shipments. This urgency for supplies runs to almost all products, but is especially marked in those finding ultimate use in automobiles. Ingot production is easily 85 per cent of capacity, and, of the 26 steel works blast furnaces in the Mahoning and Shenango Valleys, 18 are making iron. In the finishing mills, the highest rate of operation is at the sheet mills, of which only a small percentage are

idle. Tin plate mills are not doing so well as in the summer, but operations are making a good showing compared with this time last year. Strip mills capacity is largely engaged, and so are the bar mills. Seamless pipe mills and those producing the larger sizes of welded pipe are active, reflecting a strong demand for deep well casing and drill pipe and for oil and gas pipe lines. The wire mills are merely jogging along.

Primary materials are featured by a strong demand for basic iron and an indifference on the part of producers for business. Inquiries amounting to 12,000 tons of this grade recently have reached local producers, and have been turned down, not because the price was unsatisfactory, but because merchant furnaces appear to have none of this grade and the steel producers feel they will need all the iron they have or will produce during the remainder of the year. There is a very tight situation in the steel works grades of scrap, but most melters appear to have bought some time ago when prices were lower and now are merely demanding deliveries on those purchases and thus are escaping the higher prices lately reached.

Birmingham

Pig Iron Producers Well Booked—Steel Mills Enter Last Quarter with Good Backlogs

BIRMINGHAM, Oct. 2.—The weekly volume of new business in the pig iron market is holding up well and from the standpoint of forward bookings producers are in a better position than at any time in the past several months. Buying is principally in moderate lots. Considerable iron is yet to be purchased for the fourth quarter. Shipments last week dropped slightly from the average of the past few weeks. Production of foundry iron has been increased by the blowing in of No. 3 Woodward furnace of the Woodward Iron Co. on Sept. 29. This furnace was blown out on Aug. 21 for relining. Nineteen furnaces are now in blast, of which 11 are on foundry, six on basic, one on recarburizing iron and one on ferromanganese.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil.....	\$16.25
No. 1 fdy., 2.25 to 2.75 sil.....	16.75
Basic	16.25

Finished Steel.—Fourth quarter prices are in effect with an advance of \$2 a ton on bars, plates and shapes. Blue annealed sheets are now being quoted at 2.15c. Other sheet prices are unchanged. The one-half of 1 per cent discount rate was placed in effect on Oct. 1. Both orders and inquiries were unusually heavy during the past week and backlogs were further increased. New business booked during September was ahead of that in August, which was one of the best months of the year. All lines are active with the exception of steel rails. Specifications against contracts

are running heavy. The structural steel market shows signs of recovering from the recent dull period. The Ingalls Iron Works Co. has orders for 100 tons for two airplane hangars at Pensacola, Fla., and 180 tons for the Gulf States Paper Corporation, Tuscaloosa, Ala. The Nashville Bridge Co. is beginning the fabrication of about 3000 tons of steel for the Chef Mentour and Rigolets bridges in Louisiana. New business of bar manufacturers has been good. New bookings of the Connors Steel Co. include 450 tons of bars for a school at New Orleans, 175 tons for a hotel at Huntsville, Ala., 150 tons for a school at Knoxville, Tenn., and 120 tons for a bridge at Mobile, Ala. Reeves Brothers are at work on an order for 66 oil storage tanks ranging in capacity from 55,000 bbl. to 120,000 bbl. No change has been made in open-hearth operations. The Tennessee company has 12 active, six at Fairfield and six at Ensley, and the Gulf States Steel Co. continues with four at Alabama City.

Cast Iron Pipe.—Pressure pipe manufacturers continue to book a steady volume of small orders sufficient to maintain plant operations at a normal rate for this season. A good volume of business is pending and makers expect some worthwhile tonnage shortly. Stocks are still being drawn upon occasionally. Prices have been advanced \$2 a ton; quotations now are \$36 to \$37 on 6-in. and larger sizes.

Coke.—Consumers' requirements for foundry coke for the last quarter are covered. Practically all the important buyers have also covered for the first quarter. The usual amount of spot business is being done. There is a good run of orders for domestic coke. Quotations are unchanged from the \$5 base for both spot and contract coke.

Old Material.—The market has become fairly stable at the prices which have prevailed for the past three weeks. Some activity is noted in all

lines, but orders are largely for present needs. Shipments to mills continue active.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel.....	\$10.00 to \$11.00
Scrap steel rails.....	11.50 to 12.00
Short shoveling turnings..	8.00 to 8.50
Cast iron borings.....	8.00
Stove plate.....	13.50
Steel axles.....	19.00 to 20.00
Iron axles.....	21.00 to 22.00
No. 1 railroad wrought...	10.00 to 10.50
Rails for rolling.....	14.00

Cast iron carwheels.....	13.00 to 13.50
Cast iron borings, chem...	13.50 to 14.00

Canada

Structural Steel Orders Feature Markets—Large Railroad Purchases Expected Before End of Year

TORONTO, ONT., Oct. 2.—While the railroads have not placed their rail business for 1929 it is understood that large tonnages will be allotted before the end of the year. The Canadian National Railways placed orders for 55 locomotives with Canadian companies and is inquiring for five more, and is also in the market for 1500 50-ton box cars and 30 tank cars, 25 first-class coaches, two combination baggage-smoking cars and 15 sleepers.

The output of pig iron in Canada has declined somewhat from that of the high monthly average of June, but it is still greater than that of a year ago. August production amounted to 91,522 long tons, which was a slight decline from the 95,422 tons of July, but was 28,288 tons greater than that produced in August, 1927. For the eight months of this year, the total was 654,957 tons.

Pig Iron.—A rush of lagging melters to cover last quarter needs featured business in this market during the week. While tonnages involved in individual contracts were comparatively small, they totaled about 5000 tons. There are still a few who have not covered to the end of the year, but a large majority have bought. It is estimated by local blast furnace representatives that bookings for the last quarter exceed those of former quarters this year by about 15 per cent. Spot sales have continued in good volume. Radiator and sanitary ware manufacturing concerns have been extensive buyers both for spot and future delivery. While the agricultural implement industry is recognized as one of the largest consumers of pig iron in Canada, it procures practically its entire supply in the United States markets, because it has the advantage of duty-free iron. Canadian prices are strong.

Prices per gross ton:

Delivered Toronto	
No. 1 fdy., sil. 2.25 to 2.75.....	\$23.60
No. 2 fdy., sil. 1.75 to 2.25.....	23.60
Malleable.....	23.60
Delivered Montreal	
No. 1 fdy., sil. 2.25 to 2.75.....	25.00
No. 2 fdy., sil. 1.75 to 2.25.....	25.00
Malleable.....	25.00
Basic.....	24.00
Imported Iron, Montreal Warehouse	
Summerlee.....	33.50
Carron.....	33.00

Structural Steel.—Most of the orders awarded during the past week were confined to lots under 500 tons, but two or three larger contracts were also closed and others are still pending. The Dominion Bridge Co., Montreal, reports orders for 5000 tons for the new Eaton Building in Toronto, and 6000 tons for the Dominion Square Building in Montreal. John T. Hepburn, Ltd., Toronto, has the contract to supply 500 tons of structural steel for building at University Avenue and Elm Street, Toronto. The Trussed Concrete Steel Co., Walkerville, Ont., has contract for 750 tons of steel for

office building for S. E. Dinsmore, Ltd., Windsor, Ont. The Disher Steel Construction Co., Toronto, received an order for 250 tons of reinforcing bars for car barns at Oshawa, Ont., for Canadian National Electric Railways. For a new office building at Yonge and Colborne Streets, Toronto, for the Crown Life Insurance Co., about 5000 tons of steel will be required; 300 tons of reinforcing bars will be needed for the new Balfour Building, St. Lawrence Boulevard, Montreal.

Old Material.—Spot sales were strongly featured in transactions of the week. Shipping orders against old contracts, however, are appearing at regular intervals, and the movement of scrap is large. Heavy melting steel, turnings, machinery cast, wrought iron and steel axles are in the greatest demand. Prices are firm in the Toronto and Montreal markets.

Dealers' buying prices:

	Per Gross Ton	
	Toronto	Montreal
Heavy melting steel....	\$9.00	\$7.00
Rails, scrap.....	10.00	9.00
No. 1 wrought.....	9.00	11.00

Malleable scrap.....	13.00	

Buffalo

Pig Iron Prices Firm—Steel Mills Operating at 90 Per Cent—Scrap Prices Move Higher

BUFFALO, Oct. 2.—The steadiness of the pig iron price situation is shown by a sale of 250 tons to a district melter by a local furnace at \$17.50, furnace, for No. 2X grade and at \$18.50 for No. 1X. For shipment outside this immediate district, local furnaces are adhering to a \$17 base for delivery during the remainder of this year and to \$17.50 for first quarter. For delivery within the local territory, quotations are 50c. a ton higher both for last quarter and first quarter. Predictions of another price advance are prevalent. Inquiry now before local sellers amounts to about 2000 tons. The Hanna Furnace Co. has lighted its new stack, now having three in blast in this district. Pig iron ship-

ments by barge canal for the week ended Sept. 29 were 900 tons.

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil. 1.75 to 2.25.....	\$17.00 to \$18.00
No. 2X fdy., sil. 2.25 to 2.75.....	17.50 to 18.50
No. 1X fdy., sil. 2.75 to 3.25.....	18.50 to 19.50
Malleable, sil. up to 2.25.....	17.50 to 18.50
Basic.....	17.00 to 17.50
Lake Superior charcoal....	27.28

Finished Iron and Steel.—Bar, shape and plate prices are firm at 2c. to 2.10c., Buffalo. Some bars have been sold for 2.05c., Buffalo, and on small lots, 2.10c. is being obtained. Sheet business is very good at the recently established prices. A structural job amounting to 650 tons at Ithaca, N. Y., was awarded to a local fabricator. Average steel mill operation is about 90 per cent. Reinforcing bar business has tapered. Warehouse business continues to improve.

Old Material.—A large purchase of No. 1 heavy melting steel, No. 2 heavy melting steel and hydraulic compressed sheets was made during the week at \$15.50 for the No. 1 grade. Between 10,000 and 15,000 tons is said to have been bought. At the same time, \$16 has been paid for strictly No. 1 steel. A few sales of railroad malleable at \$15.50 to \$16 are re-

Warehouse Prices, f.o.b. Buffalo

	Base per Lb.

Detroit Scrap Market Stronger

DETROIT, Oct. 2.—Some further price advances have been registered during the past week in the scrap market in this district. Borings and short turnings and long turnings are 50c. higher. There is no sign of weakness, and dealers generally do not look for recessions from present prices in the near future.

Dealers' buying prices per gross ton, f.o.b. cars, Detroit:

Hvy. melting and shov. steel	\$12.00 to	\$12.50
Borings and short turnings	8.50 to	9.00
Long turnings.....	7.50 to	8.00
No. 1 machinery cast.....	14.00 to	15.00
Automobile cast	19.00 to	20.50
Hydraul. comp. sheets....	11.50 to	12.00
Stove plate	11.00 to	12.00
No. 1 busheling.....	9.50 to	10.00
Sheet clippings	7.50 to	8.00
Flashings	10.00 to	10.50

Italian Government Buys Steel Plant

HAMBURG, GERMANY, Sept. 15.—The Italian Government, according to a recent announcement, has acquired the Armstrong steel works at Pozzuoli, near Naples. The plant has a capacity of 80,000 tons a year. This will be the only Government-owned steel works in Europe, outside of Russia. Production of electric steel in Italy is expected to total about 300,000 tons this year, compared with 255,000 tons in 1927.

Boston

Pig Iron and Scrap Prices Are Stronger—Domestic Demand for Coke Rushes Ovens

BOSTON, Oct. 2.—Not more than 2500 tons of pig iron was sold through Boston brokers in the past week. The largest individual sale reported was 500 tons of No. 2X by the Mystic Iron Works to a Connecticut foundry at 75c. a ton higher than was quoted by that stack a fortnight ago, and equivalent to a shade under \$17.50 a ton, Buffalo. Otherwise, sales were largely in car or 100-ton lots and included Buffalo, Alabama, western Pennsylvania, New York State and Indian iron, the last named at \$21.25 to \$21.75 a ton on dock here, duty paid. The feature of the market has been the activity in shipments on contracts. Foundries evidently are endeavoring to stock up before cold weather sets in. The rail and water movement from the Buffalo district into New England has been heavier than at any previous time this season, and stocks of regular grades of iron in Buffalo furnace yards are reported as down to practically nothing.

Foundry iron prices per gross ton deliv'd to most New England points:

*Buffalo, sil. 1.75 to 2.25..	\$21.91
*Buffalo, sil. 2.25 to 2.75..	\$21.91 to 22.41
†Buffalo, sil. 1.75 to 2.25..	20.78
†Buffalo, sil. 2.25 to 2.75..	20.78 to 21.28

*All rail rate. †Rail and water rate.

Coke.—New England ovens are swamped with business. The New England Coal & Coke Co. is still behind on foundry coke deliveries, with little indication of catching up during

the next fortnight. Last week's colder weather created a large demand for domestic coke. The company last week reduced its stock pile more than 2000 tons, and on Oct. 1 advanced its retail price in the Boston district from \$12.50 a ton to \$13. The Providence Gas Co. is slightly behind on domestic coke deliveries, but is up to date on foundry coke. Both companies quote foundry coke at \$11 a ton, delivered within a \$3.10 freight rate zone. On Sept. 24 the first oven of the New Haven, Conn., coke plant was pushed.

Warehouse Business.—The movement of iron and steel out of warehouses has been gathering momentum since Labor Day. Consumers are still taking conservative amounts of stock, but are buying more often. Warehouses are holding more rigidly to listed prices.

Old Material.—With liberal shipments now going to eastern Pennsylvania, while those to the Pittsburgh district are holding up well, the old material market is more active. Continued buying of scrap for export also contributes to the activity. There is a narrow market for railroad and yard wrought, but practically all other kinds of scrap are selling, and prices generally are strong, with an upward tendency. Some brokers have raised their price on heavy melting steel 25c. a ton to \$11, on cars, shipping point; steel turnings and mixed borings and turnings are up 25c. to \$6.75, on cars, and specification pipe is 50c. higher at \$10, on cars. At least one shipper last week paid as high as \$7.50 a ton, on cars, for forge scrap, but \$7 appears to be the general limit. The same shipper paid \$15 a ton, on cars, for shafting, which is 50c. more than most brokers have been offering. It is estimated that 10,000 tons of scrap will be exported from Boston between now and Jan. 1. On Oct. 8 the Boston & Albany Railroad will close bids on 1000 tons of No. 1 rails and miscellaneous scrap.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel.	\$10.75 to	\$11.00

Cincinnati

Sheet Specifications Heavy and Prices Are Firmer—Pig Iron Quiet but Quotations Are Steady

CINCINNATI, Oct. 2.—The pig iron trade has been quiet in the past week. Most buyers have contracted for their needs until the end of the year, so that sales have been confined to small miscellaneous lots. The only sizable inquiry is from the Anderson Stove Co., Anderson, Ind., for 500 tons of foundry iron for first quarter delivery. Despite the lack of interest on the part of consumers, prices are being well maintained. Lake Erie iron is quoted at \$17.50, base Cleveland, while Alabama and Tennessee furnaces are asking \$16.25, base Birmingham. Practically all of the yard stocks of foundry iron at Ironton are reported to have been sold, and, since no merchant furnace is active at that point, prices are merely nominal.

Prices per gross ton, deliv'd Cincinnati:
So. Ohio fdy., sil. 1.75 to 2.25 \$18.89 to \$19.89
So. Ohio malleable..... 20.14 to 20.89
Ala. fdy., sil. 1.75 to 2.25.. 19.94
Ala. fdy., sil. 2.25 to 2.75.. 20.44
Tenn. fdy., sil. 1.75 to 2.25 19.94
So'th'n Ohio silvery 8 per cent 26.89

Freight rates, \$1.89 from Ironton and Jackson, Ohio; \$3.69 from Birmingham.

Finished Material.—Sheet specifications booked in the past week by a large manufacturer in this district have been the largest in the history of the company and all operating units have sufficient unfilled orders to insure production at full capacity for the next two weeks or longer. The tonnage demand has been well distributed among consuming industries. The roofing season in the South is fully up to normal, and in some cases sales have exceeded the average. Sheet makers apparently are having no difficulty in maintaining prices, which have been well stabilized at 2c. to 2.10c., base Pittsburgh, for blue annealed, 4c. for automobile body, 2.75c. for black and 3.50c. to 3.60c. for galvanized. Bars, structural shapes and plates are reported to be selling at 1.95c., base Pittsburgh, to large buyers and at 2c. to small users. Fabricators have increased operations slightly, although

they are having difficulty in getting enough business to sustain current production schedules. The wire market is dull. Common wire nails are bringing \$2.69 per keg, delivered Cincinnati.

Coke.—A sharp upward turn in specifications for by-product foundry coke in the last two weeks of September carried shipments for the month almost 25 per cent above those of August. Colder weather has brought a better demand for domestic grades. As predicted a week ago, prices in this district will not change during October. By-product foundry coke at Detroit remains at \$9, delivered to local consumers, and at \$10, delivered to users outside of the Detroit switching area. Movement of beehive coke from the Wise County and New River districts has been fair.

Wise County foundry coke is selling at a minimum of \$4.25, ovens, and furnace coke at \$3.50.

Old Material.—While shipments to consumers are holding up well, dealers have divergent opinions regarding the course of the market in the next 30 days. Quotations are unchanged. Much interest is being shown in prices which railroads will get this month for their scrap. The Big Four has a list of about 2500 tons closing today.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel.....	\$12.50 to \$13.00
Scrap rails for melting....	13.00 to 13.50
Loose sheet clippings.....	9.25 to 9.75
Bundled sheets	10.00 to 10.50
Cast iron borings.....	8.50 to 9.00
Machine shop turnings....	8.00 to 8.50
No. 1 busheling.....	10.50 to 11.00
No. 2 busheling.....	6.00 to 6.50
Rails for rolling.....	13.00 to 13.50
No. 1 locomotive tires....	13.00 to 13.25
No. 2 railroad wrought....	12.50 to 13.00
Short rails	17.00 to 17.50
Cast iron carwheels.....	12.00 to 12.50
No. 1 machinery cast.....	16.00 to 16.50
No. 1 railroad cast.....	13.00 to 13.50
Burnt cast	8.00 to 8.50
Stove plate	9.25 to 9.75
Brake shoes	10.25 to 10.75
Railroad malleable	12.25 to 12.75
Agricultural malleable....	11.25 to 11.75

Export Trade Remains Quiet

Prices Unchanged Despite Strong Domestic Market—Foreign Steel Sold Here With Difficulty

NEW YORK, Oct. 2.—Export trade continues rather small, with such foreign markets as Japan, China, Cuba and South America buying only limited quantities of steel products. Prices for export are substantially unchanged from the level of previous weeks, despite greater strength in the domestic market. Tin plate is quoted at about \$5.20 per base box, c.i.f. Japanese port, and light-gage black sheets are about \$76 per ton, c.i.f. Japan.

Importers of steel in New York are still disposing of small tonnages of Continental material, but at a low margin of profit, because of the high prices prevailing in Europe. Such business as has been done is attributable to the firmness of American mill prices, especially on bars. Recently 150 to 200 tons of foreign plain steel bars is reported to have been sold to a consumer here at 2.08c. per lb., duty paid. Importers are still able to offer hot-rolled hoops at about 2.40c. per lb., duty paid, for No. 18 gage, which is several dollars a ton under the domestic mill price, except in certain territories where American producers have met foreign competition.

The Government is understood to be preparing a test case on the marking of material with the country of origin, which is expected to come before the Customs Court about Oct. 17. The defendant is to be the Standard Sales Co., New York.

Final decision of the Customs Court of Appeals on the appeal of the Government from the decision of Justice

Fischer classifying reinforcing bars as construction material, subject to a lower duty than plain bars, is expected about Oct. 11.

Continental Rail Prices May Be Advanced

HAMBURG, GERMANY, Sept. 15.—It is generally expected that at the next meeting of the European Rail Makers Association export prices on rails will be advanced from the present level of £6 7s. 6d. (\$30.98) per ton to £6 10s. (\$31.59) per ton, for eastern Asiatic markets. For all other foreign markets, except Europe, it is expected that the price will be advanced to £6 12s. 6d. (\$32.20) per ton. The price to European buyers, it is believed, will be £6 15s. (\$32.80) per ton. The reason given for the smaller advance to the Asiatic buyers is that higher prices might result in the loss of the Far Eastern markets to American mills.

It is announced by the United Steel Works, Düsseldorf, Germany, licensee of the American Rolling Mill Co., Middletown, Ohio, for the production of Armco products in Germany, that business in this material has developed satisfactorily. Demand is especially good for boiler plates and tubes of Armco iron. The licensee has just begun to produce Armco wire.

Non-Ferrous Metal Markets

**Copper Quiet and Strong,
Tin Active and Higher, Lead
Steady and Unchanged, Zinc
Quiet and Firm**

Copper.—September set a new record in total sales at close to 250,000 net tons, according to reliable estimates. Between 145,000 and 150,000 tons was for domestic consumption. The foreign sales at about 100,000 tons, while very large, did not equal by about 5000 tons the heavy transactions last May. Domestic buying extended as far ahead as December and it is generally admitted that consumers have bought all their October and November requirements and at least 75 per cent of those for December. If the amount probably bought in excess of requirements for October-November is recognized, it is probable

*Refinery quotation; delivered price ¼c. higher.

that domestic needs for the rest of the year are well provided for. Foreign consumers must still buy about one-third of their October normal requirements, about two-thirds of their November needs and considerable for December. Quotations are unchanged at the recent advance, with electrolytic selling at 15.25c., delivered in the Connecticut Valley, and at 15.50c., c.i.f. European ports, which is the official quotation of Copper Exporters, Inc. As the month opens, the market is naturally quiet and will probably continue so for some little time, although foreign buying may be somewhat active. On Oct. 1, mining companies advanced the wages of their miners 10 per cent, which is estimated to increase the cost of refined copper from ⅜c. to ½c. per lb. This has been taken care of in the recent advances in the price of refined metal. Lake copper is moderately active and strong at 15.25c., delivered.

Copper Averages.—The average price of Lake copper for September, based on daily quotations in THE IRON AGE, was 14.95c., delivered. The average price of electrolytic copper was 14.70c., refinery, or 14.95c., delivered in the Connecticut valley.

Tin.—Because of strong manipulation in London, which has tended to cause excitement in the New York market, sales have been large to both consumers and dealers. For the week ended Saturday, Sept. 29, about 2000 tons changed hands, making the total for the last 10 weeks about 10,000 tons. Sales last week included deliveries all the way from spot to January and February. Flotation of mining shares in London is said to have pushed the market up in the last few days. Business this week, Monday and Tuesday, has been moderately active with spot Straits tin quoted Tuesday at 49.75c., New York, the highest since early in June. Prices in

Non-Ferrous Rolled Products

Mill prices on bronze, brass and copper products have not been changed since the advance of Sept. 24. Zinc sheets are quoted at 9.75c., base, and lead full sheets at 10c. to 10.25c.

Obituary

GEORGE D. McILVAINE, formerly secretary of the National Pipe and Supplies Association and of the Enameled Sanitary Ware Manufacturers Association, died in Pittsburgh, Sept. 28. He had long been prominent in trade association work, and in recognition of his efforts in this direction, was elected one of the early presidents of the American Trade Association, an organization composed of executives of trade associations. Born in Chambersburg, Pa., 58 years ago, he was graduated with the class of 1889 from Lafayette College, of which he later became a trustee. Ill health forced him to relinquish his secretaryship of the pipe and supplies and the sanitary ware associations a few years ago, but he was elected honorary secretary of both organizations. He also was secretary of the American Shovel Institute and the Forged Tool Society.

FRED I. TEALE, sales representative of Eaton, Rhodes & Co., Cincinnati, pig iron and coke dealers, died at his home in Norwood, Ohio, Sept. 28, after a two months' illness. He was one of the best known salesmen in the southern Ohio pig iron trade. For many years he was associated with Rogers, Brown & Co., first at Buffalo and later at Cincinnati. Shortly after Rogers, Brown & Co. and Crocker Brothers consolidated, Mr. Teale was appointed resident agent at Cincinnati for the M. A. Hanna Co. Recently he resigned this position to become connected with Eaton, Rhodes & Co.

J. C. YARNELL, for 17 years Western sales manager at Detroit for the Clark Brothers Bolt Co., Milldale, Conn., died suddenly at Kalamazoo, Mich., on Sept. 25. Prior to his connection with the bolt industry, Mr. Yarnell had been engaged in the wagon and carriage spring business.

JAMES PARKER, president Kitts Mfg. Co., Oswego, N. Y., maker of steam specialties, died at his home in that city on Sept. 23, aged 62 years.

THOMAS R. TIMOTHY, manager Chester works, American Sheet & Tin Plate Co., Chester, W. Va., died at St. Francis Hospital, Pittsburgh, Sept. 27. He was born at Leechburg, Pa., 52 years ago and had been identified with the company for 35 years, starting as sweeper in the mill at Leechburg and serving as a hot mill foreman at the Cambridge and Martins Ferry, Ohio, works of the company before his promotion 16 years ago to the management of the Chester works.

Horace T. Potts & Co., Philadelphia, have sold an acre of ground at the extreme east of their warehouse property in North Philadelphia to the International Harvester Co., which is expected to erect a service station for trucks.

London Tuesday were higher than a week ago, with spot standard quoted at £224, future standard at £220 17s. 6d. and spot Straits at £224 10s. The Singapore price was £225 10s., up nearly £4 in the week. Statistics for September did not create a favorable impression. Shipments from the Straits were 8310 tons, with Banca shipments at 1717 tons, both larger than expected. American deliveries into consumption were 6685 tons, which was well below estimates. There was an increase in the world's visible supply of 1468 tons, bringing the total on Oct. 1 to 19,924 tons.

Lead.—Business continues in satisfactory proportions, and prices are unchanged and strong. In the outside market, quotations stand at 6.32½c., St. Louis, for October, and 6.35c. for November. The leading interest continues to quote 6.50c., New York, as its contract price.

Zinc.—Extreme quietness pervades the market, but prices continue firm and unchanged at 6.25c., East St. Louis, or 6.60c., New York. Production of ore in the Joplin district was high last week at about 10,500 tons, but it is expected every fourth week the output will be decidedly curtailed.

Antimony.—Because of curtailed

stocks here and a fairly active demand for the metal, Chinese antimony is higher at 11.50c., New York, duty paid for spot and 10.87½c. to 11c., for future.

Nickel.—Wholesale lots of ingot nickel are quoted at 35c. with shot nickel at 36c. and electrolytic at 37c. per lb.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is quoted at 23.90c. per lb., delivered.

Non-Ferrous Metals at Chicago

CHICAGO, Oct. 2.—Sales of copper for immediate use are larger and prices have advanced. Quotations on tin are higher under the influence of foreign markets. The old metal market shows a more quiet tone but prices are unchanged.

Prices, per lb., in carload lots: Lake copper, 15.50c.; tin, 51.50c.; lead, 6.45c.; zinc, 6.35c. in less-than-carload lots; antimony, 12c. On old metals we quote copper wire, crucible shapes and copper clips, 10.75c.; copper bottoms, 9.75c.; red brass, 9.50c.; yellow brass, 7.25c.; lead pipe, 4.75c.; zinc, 3.50c.; pewter, No. 1, 30c.; tin foil, 36.25c.; block tin, 45.25c.; aluminum, 12c., all being dealers' prices for less-than-carload lots.

Reinforcing Steel

Awards of 8100 Tons—1800 Tons in New Work

AWARDS of 8100 tons, reported to THE IRON AGE during the last week, included 1400 tons for a garage in New York. New projects, calling for only 1800 tons, included no jobs of outstanding size. Awards follow:

WORCESTER, MASS., 400 tons, telephone building, to Jones & Laughlin Steel Corporation.

WALTHAM, MASS., 100 tons, State hospital, to Barker Steel Co.

NEW YORK, 1400 tons, Packard garage and service station, to Jones & Laughlin Steel Corporation.

NEW YORK, 500 tons, two sections of subway; 100 tons in section 5-B, route 109, from Cornell Contracting Corporation, and 400 tons in section 1, route 106, from George H. Flinn Corporation, to McClintic-Marshall Co.

NEW YORK, 550 tons, Government barracks on Governor's Island; from James McWilliams, general contractor, to Igloe Brothers.

JONES BEACH, N. Y., 850 tons, causeway; from C. H. Earle, general contractor, to E. T. Edwards, Columbia, Pa.

ALBANY, N. Y., 340 tons, Alcove dam, to McClintic-Marshall Co.

RED BANK, N. J., 100 tons, sewage disposal plant, to Igloe Brothers.

RUTHERFORD, N. J., 100 tons, Erie Railroad bridge, to McClintic-Marshall Co.

KNOXVILLE, TENN., 150 tons, science building, to Connors Steel Co.

NEW ORLEANS, 450 tons, McDonough School, to Connors Steel Co., Birmingham.

MOBILE, ALA., 120 tons, Fowl River bridge, to Connors Steel Co.

HUNTSVILLE, ALA., 175 tons, Russell Erskine Hotel, to Connors Steel Co.

JACKSONVILLE, FLA., 100 tons, Jacksonville Title & Trust Co. building, to Connors Steel Co.

STICKNEY, ILL., 600 tons, construction

work for Sanitary District, to Barton Spiderweb System, Inc.

CHICAGO, 140 tons of rail steel bars, garage, to Concrete Steel Co.

CHICAGO, 200 tons, building for Commonwealth Edison Co., to Olney J. Dean & Co.

CHICAGO, 200 tons, apartment hotel, awarded by Gamm Construction Co. to an unnamed bidder.

CHICAGO, 600 tons of rail steel bars, building at 4940 East End Avenue, to Calumet Steel Co.

HIGHLAND PARK, ILL., 100 tons, Moraine Hotel, to Concrete Engineering Co.

EVANSTON, ILL., tonnage not stated, store and apartment building for Victor C. Carlson, to Kalman Steel Co.

STATE OF ILLINOIS, 300 tons of rail steel bars, State road work, to Calumet Steel Co.

SEATTLE, WASH., 100 tons, three small jobs, to Northwest Steel Rolling Mills.

SAN FRANCISCO, 500 tons, Great Western Power Co. plant at India Basin, to Pacific Coast Steel Co.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

ASBURY PARK, N. J., 300 tons, convention hall; Turner Construction Co., general contractor.

WASHINGTON, 450 tons, Arlington Memorial Bridge.

CHICAGO, tonnage not stated, apartment building at 4728 East End Avenue.

CHICAGO, 225 tons, apartment building at 5912 Commonwealth Avenue; Olsen & Urbain, architects.

CHICAGO, 100 tons, apartment building at 3021 Washington Boulevard; E. F. Bahrens, architect.

OAK PARK, ILL., tonnage not stated, four-story office and store building; Holabird & Root, architects.

FORT LEWIS, WASH., 575 tons, three Government buildings; Chrisman & Snyder, general contractors.

LOS ANGELES, 170 tons, apartment building, Ninth and Union Streets; bids being taken.

PERSONAL

E. F. SCOTT, who has been engineer on layout, design and equipment of foundries for the Austin Co., Cleveland, has been appointed secretary-manager of the Ohio Foundries Association, Inc., succeeding ARTHUR J. TUSCANY, who recently became manager of the Gray Iron Institute.

E. F. SCOTT

Mr. Scott has been in close contact with the foundry industry for several years in engineering and sales work and has also devoted a great deal of attention to the business problems of the foundry. He is a member of the American Foundrymen's Association and has written texts and papers on subjects relating to some of the technical problems of the foundry industry. He assumed his new position Oct. 1, with headquarters in Cleveland.

FRANK HURD, formerly superintendent of the Gadsden and Sheffield, Ala., furnaces of the Sloss-Sheffield Steel & Iron Co., Birmingham, has been made superintendent of the Vanderbilt furnaces of the Woodward Iron Co. at Vanderbilt, Ala.

GEORGE L. BITTING, director of sales Bunting Brass & Bronze Co., Toledo, has tendered his resignation, effective immediately. He has announced no specific plans for the future.

A. M. LYMAN, for 15 years identified with the sales department of the American Cast Iron Pipe Co., Birmingham, has become associated with the sales organization of the Birmingham Foundry & Machine Co., Birmingham.

B. W. ROGERS has been appointed representative at Akron, Ohio, for the Falk Corporation, Milwaukee, and will have headquarters at 225 Cen-

tral Savings & Trust Building. He has recently been identified with the B. F. Goodrich Co. in that city and previously was associated with the Allis-Chalmers Mfg. Co.

J. A. WRIGHT has resigned as sales manager National Cast Iron Pipe Co., Birmingham, and is devoting his time to private business interests at Pensacola, Fla.

D. WALKER WEAR has been elected president of the Stowe Mfg. Co., Binghamton, N. Y., succeeding the late CHARLES F. HOTCHKISS.

ARTHUR C. TOZZER, vice-president Turner Construction Co., in charge of the Boston territory, has been elected executive vice-president of the company, with headquarters at the main office, 420 Lexington Avenue, New York. WILLIAM H. NYE, who has been Boston contract manager, has been named to succeed Mr. Tozzler as vice-president in charge of the Boston office, 178 Tremont Street.

L. S. MONROE has resigned as advertising manager Electric Controller & Mfg. Co., Cleveland, to become associated with the Copperweld Steel Co., Glassport, Pa.

ARTHUR F. SCHERER, Cincinnati district sales manager Wheeling Steel Corporation, has resigned, and Hu-

H. B. MILLER

BERT B. MILLER, for the past year in the Detroit district sales office, has been named to succeed him. Mr. Scherer has been associated with the Wheeling corporation or its subsidiaries for the past 16 years. He intends to enjoy a long period of rest on the Pacific Coast. Mr. Miller has been engaged in the steel business for 21 years. Starting in 1907 as clerk

with the Otis Steel Co., he was elected secretary of that company in 1919, and resigned that position in March, 1927, to go with the Wheeling Steel Corporation.

A. V. WILLGOOS, chief engineer of the Pratt & Whitney Aircraft Corporation, Hartford, Conn., gave an illustrated talk on engines manufactured by his company, at a meeting of the New Britain, Conn., section of the American Society of Mechanical Engineers on Sept. 27. He will address the Boston section this month on the same subject.

H. E. CHILCOAT, who has been engaged in consulting commercial engi-

H. E. CHILCOAT

neering work since 1926, has been appointed manager of sales for the air dump car division, Koppel Industrial Car & Equipment Co., Pittsburgh. He began his business career in 1900 in the employ of the Pennsylvania Railroad. In 1906 he became associated with the Westinghouse Air Brake Co. as traveling inspector, with headquarters at Richmond, Va. Later he was transferred to the company's sales department at Pittsburgh, continuing in sales work until 1918. He then resigned to become manager of the Clark Car Co., Pittsburgh, holding that position until 1926.

PROF. FRANK P. MCKIBBEN, consulting structural and bridge engineer, will lecture before various engineering societies throughout the country during the winter on the application of electric arc welding to the noiseless construction of buildings, based upon the experience of the General Electric Co. and other companies. On Oct. 4, Professor McKibben will speak before the Rochester (N. Y.) Engineering Society, and on Oct. 11 at the fall meeting of the American Welding Society.

P. A. TERRELL, formerly manager of the new industries division of the Mississippi Power Co., has taken

charge of central station and railroad sales for the Copperweld Steel Co., Chicago. He was graduated in electrical engineering from the Alabama Polytechnic Institute in 1917 and spent the following nine months on the General Electric Co. test course at Schenectady, N. Y. After serving in the Marine Corps during the war, he joined the Alabama Power Co., remaining with it until May, 1927, when he became identified with the Mississippi company.

F. H. WILLCOX and L. E. L. THOMAS, vice-presidents, and GORDON FOX, electrical engineer, of the Freyn Engineering Co., Chicago, returned Sept. 18 from a four months' business trip to Russia, where this company is constructing two steel mill units for the Soviet Government.

A. H. TISCHER has been appointed representative in southern and central Indiana and Louisville, Ky., for the Foote Brothers Gear & Machine Co., Chicago, and will have headquarters at 704 North Alabama Street, Indianapolis.

A. J. FORSCHNER, who in July of this year was appointed vice-president of the Atlas Conveyor Co., 20 South Fifteenth Street, Philadelphia, has also taken over the duties of secretary of the company. In this capacity he succeeds E. A. THUMBERT, who left the company Aug. 6.

JOHN M. WATSON, SR., has resigned as general manager of the Canonsburg Steel & Iron Works, Canonsburg, Pa. He had been associated with the company for 27 years. D. M. STEMBLE has been elected vice-president and general manager.

J. B. JOHNSON, chief of the material branch of the United States Air Corps, McCook Field, Dayton, Ohio, will speak Oct. 4 before the Cincinnati chapter of the American Society for Steel Treating on "The Application of Metallurgy in Aircraft Production."

NORMAN F. MELVILLE has resigned as manager of metallurgy and inspection for the Superior Steel Corporation, Pittsburgh. He had been with the Columbia Steel Co. at both its Elyria, Ohio, and Butler, Pa., plants.

E. J. KULAS, president Otis Steel Co., Cleveland, sailed Sept. 28 for a several weeks' trip through Europe.

F. A. BUCHDEA has been elected vice-president, and H. C. STUCESSEY, treasurer, of the Eaton Axle & Spring Co., Cleveland. They were formerly treasurer and assistant treasurer respectively.

J. R. GORMAN has been elected vice-president and general manager of the Transue & Williams Steel Forging

Corporation, Alliance, Ohio, and HAROLD O. BARKER, a partner in the banking house of Jesup & Lamont, New York, has been elected chairman of the board. Mr. Barker became interested in the company about a year ago and in the spring was elected a director and became chairman of the executive committee. He has also been elected chairman of the Murray Body Corporation, Detroit.

F. R. FISHBACK, president Electric Controller & Mfg. Co., Cleveland, has been elected vice-president in charge of the apparatus division of the National Electrical Manufacturers' Association, of which ALFRED E. WALLER is managing director. He was elected by the executive committee of the board of governors to replace N. A. WOLCOTT, resigned. Mr. Fishback was formerly sales manager of the Electric Controller company but was made vice-president and secretary of that company in 1924 and the following year was elected president. As vice-president of the apparatus division of the N. E. M. A., he will represent a group which includes about 85 per cent of all the manufacturers of electrical apparatus and machinery in the country.

FRED A. DOOLITTLE has been appointed field representative in the Central States for the Gray Iron Institute, Cleveland. He has had considerable contact with organization activities and a broad experience in personnel work. For four years he was membership secretary of the American Plan Association in Cleveland. For the past year he has been engaged in forming an association of apartment house owners in Cleveland. During the war he served as captain in the regular army and spent his time in organizing personnel departments in the Eastern territory and in assisting in settling labor disputes in arsenals and navy yards.

R. K. WEBER has been elected president of the Mount Vernon Car Mfg. Co., Mount Vernon, Ill., succeeding the late W. C. Arthur. H. H. CUST has been made vice-president, succeeding Mr. Weber.

ALOYSE MEYER, president of the International Steel Cartel, the European association which includes all the important steel producing countries of the Continent, arrived recently in New York and has started on a trip to the centers of steel production in the United States. Mr. Meyer has been president of the cartel for about one year, having been selected as its head as president of one of the largest European steel companies, the Acieries Reunies de Burbach-Eich-Dudelange in Luxemburg. He expects to return to New York in time to attend the meeting of the American Iron and Steel Institute, Oct. 26.

CHARLES WARDLOW, managing director of S. & C. Wardlow, Ltd., Shef-

field, England, maker of cutlery sheets and file steel, will arrive in this country next week to visit A. Milne & Co., 745 Washington Street, New York, the firm's agent for the United States and Canada.

GEORGE H. CHARLS, president National Association of Flat Rolled Steel Manufacturers, will address the meeting of the Pressed Metal Institute to be held in Buffalo, on Friday afternoon, Oct. 12.

TERRENCE HANLON, formerly associated with the Pennsylvania Wood & Iron Co., Buffalo, has been placed in charge of an office which has been opened at 602 Genesee Building, Buffalo, by the Hausman & Wimmer Co., Pittsburgh, dealer in steel and iron and steel scrap. EDWARD R. JONES, recently with the Rochester Iron & Metal Co., Rochester, N. Y., is associated with Mr. Hanlon.

L. C. WILSON, for eight years vice-president and general manager of the Federal Malleable Co., West Allis, Wis., has been appointed assistant to PAUL LLEWELLYN, president Interstate Iron & Steel Co., Chicago.

L. DUDLEY CARR has been appointed assistant superintendent of the Auburn, N. Y., works of the International Harvester Co. He succeeds ADELBERT P. JONES, who has been made superintendent of the company's Canton, Ill., plant.

WILBUR F. HELMER, formerly chief engineer of the F. L. Hughes Co., Rochester, N. Y., has been made general manager of the Utica Structural Steel Corporation, Utica, N. Y., recently formed as a reorganization of the Andrews Iron & Steel Corporation. He replaces GEORGE W. ANDREWS, who was general manager of the Andrews corporation. The company plans an addition to its East Utica plant.

F. H. MOYER has been elected president of the Mackintosh Hemphill Co., Pittsburgh. He has been identified with this company for the past two years, most of the time as executive vice-president.

H. C. WEIDNER, general manager Townsend Co., New Brighton, Pa., has been elected president, succeeding the late R. T. TOWNSEND. Mr. Weidner has been with the Townsend organization for 15 years and has been active in the bolt, nut and rivet industry for 28 years. Before becoming general manager, he was for several years general sales manager.

Debevoise-Anderson Co., pig iron, coke and coal, has moved from 114 Liberty Street to suite 1201, 117 Liberty Street, New York.

Tin Plate Agreement Runs Three Years

Plan Effective Now Expected to Increase Welsh Exports—Wage and Freight Advances in Germany May Raise Steel Prices

(By Cable)

CLEVELAND pig iron is still quiet, especially for export, and consumers are looking for lower prices, but makers are maintaining a firm market. Hematite iron is active both at home and for export and stocks have considerably diminished so that prices are steadier. Foreign ore continues quiet.

Finished steel is active in the domestic market, but is generally quiet in export trade. Cammell, Laird & Co., Ltd., has secured a contract for one vessel of 12,000 tons for the Blue Star Line. Workman, Clark & Co. of Belfast are to build six 9000-ton vessels for Andrew Weir & Co., which enables them to resume operations at their south yard, which has been closed since the old company disbanded. The contract for a dockyard at Singapore has been placed by the Admiralty with Sir John Jackson,

Ltd., of London. The work is to be completed within 7 years.

Welsh tin plate bar makers are booked with good orders from the Welsh tin plate mills. Tin plate is moderately active with forward sales at 18s. 3d. (\$4.43) per base box, f.o.b. works port. Consumer interest is increasing. The Welsh-United States agreement on tin plate operates for three years from Oct. 1.

Galvanized sheets are strong as a result of makers' well sold order books and the substantial strength of Continental steel prices. Japan has been a steady buyer of light gage black sheets and makers are sold up to the end of the year.

Continental iron and steel prices are strong, with continued export demand and makers well booked with orders. Belgian output in August was 329,000 tons of pig iron and 332,000 tons of steel.

turn Welsh mills will have a free hand in other markets, probably throughout Europe.

Taking the exports of the two nations as 100 per cent, Wales will receive a quota of 70 per cent and the United States 30 per cent, so that Welsh makers will have a possible outlet for an additional 1,000,000 base boxes a year. With the announcement of these negotiations an optimistic tone prevails in Wales, and makers are looking forward to a period of prosperity. Their order books from October to the end of December are well filled, and some have made sales into next year. Consumers realize that the period of low prices on tin plate is ended unless there is a decided decline in the cost of production. But the cost of Continental steel has increased greatly, and Welsh steel makers are beginning to profit from that situation.

The tone of the iron and steel business as a whole has improved. Although the number of British furnaces in blast at the end of August, 130, was small, demand for pig iron shows signs of revival, consumers being more inclined to consider their winter requirements. In the domestic market British makers are holding their own, but abroad they still encounter strong competition in some quarters.

In finished products, mills engaged in the production of light material are busy and likely to continue so for a considerable period of time. Cer-

Tin Plate Agreement Aids Welsh

Mills May Increase Exports by 1,000,000 Boxes Annually—British Heavy Rolled Products Still Quiet

LONDON, ENGLAND, Sept. 18.—Interest in the iron and steel market recently has centered in the negotiations just concluded between United States and Welsh tin plate makers for the elimination of unnecessary export competition. Precise details of the scheme are still lacking, pending

the return from the United States next week of representatives of Welsh producers. Meanwhile it has been disclosed that sections of certain overseas markets are to be reserved for United States manufacturers, particularly those in which America has large capital investments, and in re-

British and Continental European prices per gross ton, except where otherwise stated, f.o.b. makers' work with American equivalent figured at \$4.86 per £ as follows:

(a) Nominal.

tain sections of the heavier industries, such as the construction and engineering branches, are well occupied, but there is still not enough tonnage for the heavy plate mills and some plants are obliged to operate alternate weeks. New shipbuilding is improv-

ing, but the volume of tonnage coming to the steel makers is not sufficient to compensate for the lack of export demand. Except for specialties, such as tin plate and galvanized sheets, export business in finished iron and steel is on a very small scale.

Belgian Industry and Finance Is Sound

British Official Publication Reviews Economic Situation of Iron and Steel and Metal Working

BELGIAN anxiety about the commercial depression which it was supposed would follow the currency stabilization during October, 1926, has not been justified, according to a "Report on the Economic Situation in Belgium," written at the end of 1927 and just published by the British Department of Overseas Trade. The British coal strike, and the rise of French and Italian currency presented some unexpected markets for Belgian products at the end of 1926. These aids were temporary, yet the trade balance has steadily improved so that at the beginning of 1928 gold was being shipped from United States to Belgium, the budget showed a comfortable surplus, and large reductions had been made in the national debt.

Cartels and amalgamations have been formed in many industries, including metallurgical, automobile and railroad supply. Another noteworthy trend is the production of finished products rather than the exportation of crude materials. Machinery manufacture is one of the few industries showing an unsatisfactory condition. Employment is high: only 1.7 per cent of all industrial workers are totally unemployed; 3.8 are partially employed. Such labor troubles as have arisen have been rapidly adjusted. Due to the restricted purchasing power of the currency and the special taxes imposed for the period 1926-1930, Belgian imports are restricted, but the report concludes that in view of the general healthy condition of all the country, commercial prospects are distinctly favorable.

Narrow Profit in Iron and Steel

Turning specifically to the iron and steel trade, the report notes that operations during the first quarter of 1927 were conducted at a narrow margin of profit, except on the part of one or two of the leading interests. Competition was keen with Germany, Luxemburg and especially France, and the trade from the Far East, India and South America was abnormally small and did not improve until the middle of the year. On account of a limited home market, Belgian producers are said to be more dependent upon exports than steel makers in other countries.

The following associations or cartels were formed during the year:

Product	Scope	Expiration Date
Wire	Germany, France, Belgium, Luxemburg	June 30, 1928
Bolts and nuts	Belgium	
Machinery	Belgium	
Pig iron	France, Belgium, Luxemburg	Jan. 1, 1929
Tubes	International	

Wages were increased 2½ per cent on Feb. 1, 1927. Two hundred and three thousand one hundred and forty-three persons are engaged in the

metallurgical industry, according to the census on Oct. 1, 1926, that counted 1,080,331 engaged in all industrial establishments employing 10 or more workers.

As above noted, trade in miscellaneous machinery is very unsatisfactory, due to high tariffs in most importing countries and sharp competition by England and Germany. In 1891 7295 workmen were employed in the machinery industry, while in October, 1927, the number had dropped to 4235. As a consequence increased specialization of producing plants is clearly recognizable.

Belgian Prices Are Strong

Mills Offer Deliveries Into January and Are Unable to Accept All Sizes—Export Trade Improving

ANTWERP, BELGIUM, Sept. 15.—Mills are still fully engaged and prices are strong, having advanced further on some products, particularly beams and rods. Considerable business is being booked and many orders are of good size. Export demand is good, with a steady volume of trade from Japan and India and increased interest shown by Chinese buyers.

More active demand from foreign consumers of steel has apparently been caused in part by the independent position of most Continental mills. French producers are firm in their quotations and not actively seeking new business. German sellers are either out of the market temporarily or quoting further advances in prices. As a result, buyers seem to be willing to accept quoted prices without making any serious attempt to secure concessions. In most cases, mills are unable to accept all sizes, so that when a range of sizes is ordered the buyer often finds it necessary to divide the business. Deliveries extend through December and even into January on the small sizes of bars and rods.

Semi-Finished Material.—Prices are strong and show a continued tendency

Steady expansion in the motor car industry is noted. Some 7000 machinists and 7400 carriage workers are employed, and in 1927 they produced about 1000 trucks and 5000 passenger automobiles. The most progress is in heavy buses for interurban transport. Various mergers and liquidations seem to indicate the evolution of an all-Belgian standard chassis, especially adapted to the nation's peculiar road requirements. Differentiation would therefore be limited to engines and bodies.

Firearm Factories Stagnant

The great industry in firearms centering at Liege is stagnant, due to customs and police regulations in most importing countries. Whereas in 1913 some 1,370,000 weapons were proofed by the official testing board, the number dropped to 550,000 in 1926. Automatic pistols and breech-loading shotguns showed the least decline.

In the Grand Duchy of Luxemburg the important iron industry has been handicapped by preferential railroad rates granted to Belgian producers, two increases in wages, compulsory charges for social welfare purposes, and slowly declining pig iron prices. The international cartel did not bring the expected results, but two of the principal producers have amalgamated, and a cooperative society of all pig iron makers has been formed to make international arrangements and allocate the orders. The net results of these handicaps and helps has been capacity furnace operation and a 9 per cent increase in both iron and steel production over 1926.

to advance. Business in blooms is small, because of the lack of available supplies. Prices range from £4 9s. (\$21.63) per metric ton for 8-in. to £4 16s. (\$23.33) per ton for 4-in. blooms. Billets are offered only occasionally and quotations are nominal at £4 17s. (\$23.57) per ton for 3-in. and £4 18s. 6d. (\$23.93) for 2-in. billets. Demand for sheet bars is good, but supplies are small. For a nominal assortment £5 (\$24.30) per ton is being asked by sellers. All these quotations are f.o.b. Antwerp.

Pig Iron.—Business is satisfactory and prices are firm, especially for export. Quotations now range up to £3 5s. (\$15.80) per ton, f.o.b. Antwerp, for No. 3 phosphoric foundry iron. The domestic price continues unchanged at 117 Belgas (\$16.25), f.o.b. furnace. Thomas steel-making iron is quoted at £3 1s. to £3 3s. (\$14.82 to \$15.31) per ton, f.o.b. Antwerp, for export and at 115 Belgas (\$15.97) per ton in the domestic market. Bessemer hematite is offered at \$18, furnace, to meet the competition of the British product.

Finished Material.—Demand is con-

siderably in excess of the available supply of material, and mills are fully booked with tonnage for the next two or three months. Deliveries, in some cases, extend into January on small sizes of bars, rods and beams. With many makers unable to accept any but certain sizes on which rolling schedules are not completed, prices are firm and size extras are fully maintained. Quotations for steel bars are £6 2s. 6d. to £6 3s. per ton (1.35c. to 1.36c. per lb.), and £6 5s. per ton

(1.37c. per lb.) is obtained occasionally for special specifications or prompt shipment. German mills are asking £6 5s. per ton (1.37c. per lb.) rather generally, but are usually able to accept any sizes specified and offer earlier delivery than Belgian makers. Beams are quoted at £5 per ton (1.10c. per lb.), f.o.b. Antwerp, and hot-rolled hoops, at £7 2s. 6d. per ton (1.57c. per lb.). Corrugated reinforcing bars are about £6 6s. per ton (1.39c. per lb.), f.o.b. Antwerp.

German Domestic Sales Better

Expected Price Advance Based on Freight and Wage Increases Brings Buying Movement

BERLIN, GERMANY, Sept. 17.—Rhenish-Westphalian experts calculate that the 11 per cent increase in railroad freight rates, which becomes effective Oct. 1, will involve an increase in steel production*cost of between 1.50 and 2 m. (35c. and 50c.) a ton. As this addition to the cost of production cannot be passed on to foreign buyers, the suggestion has been made that domestic prices be advanced 2 to 3 m. (50c. to 72c.) per ton. No formal step in this direction has yet been taken, and it is expected that the syndicates will decide to await the result of the pending wage negotiations. Consumers are strongly opposed to a price increase, which would be the third this year. Since December, 1927, the domestic price of bars has been increased from 134 m. (\$32.03) to 141 m. (\$33.70) per ton, the export price has risen approximately from 95m. (\$22.70) to 122 m. (\$29.16), and the price at which the Ingot Steel Syndicate delivers to exporting manufacturers has advanced from 93 m. (\$22.22) to 113.50 m. (\$27.23) per ton. It is claimed, therefore, that the steel industry can easily bear the small increase in production cost caused by the rise in freight rates.

The home iron and steel market improved in the first half of September. Orders were accelerated in anticipation of a price advance. Pig iron has changed little, but an increase in activity is expected late in the year. Pig iron production in August was 1,030,837 metric tons, compared with 1,115,503 tons in August, 1927.

The export market is extremely active, but Germany cannot take full advantage of this, as the Stahlwerksverband is severely rationing sales abroad, so that the German export quota of 300,000 tons a month, as fixed by the International Steel Cartel, shall not be exceeded. Firm Continental prices and active markets are expected to continue.

The domestic wire rod and wire markets are weak, but export is satisfactory, and prices are firm, except for barbed wire, in which American competition is encountered. French wire manufacturers are attempting to negotiate a national combination, which would facilitate the reestablishment of the International

Wire Cartel. The International Wire Rod Cartel has raised the export price by 2s. 6d. (60c.) a ton to £6 2s. 6d. (\$29.76) per ton, f.o.b. port. The German Mittelblech-Ver $\ddot{u}$ einigung (Medium Gage Sheet Syndicate) has been prolonged until the end of 1928, prices and selling conditions being unchanged.

The International Steel Cartel has decided to retain unchanged the production program of its members at 29,287,000 tons a year. The next meeting of the cartel will be Dec. 13. No progress was made at this month's meeting toward establishment of separate selling syndicates for different products. Poland's entry into the cartel depends upon the preliminary negotiation of a German-Polish steel agreement. Negotiations have begun, but there is not much confidence of success.

In the second quarter of 1928, as in the first, all member countries of the International Steel Cartel (Germany, France, Belgium, Luxemburg and the Saar) exceeded their production quotas. The quarterly production quota is 7,320,000 tons, but the total output of the members in the second quarter was 8,100,000 tons and in the first quarter 8,580,000 tons. Germany, whose quarterly quota is 3,160,000 tons, produced 3,710,000 tons in the second quarter and 4,210,000 tons in the first.

The Mannesmann Tube Corporation has decided to increase its capital stock by 25,000,000 m. to finance new construction in Hucking.

The engineering industry reports less domestic business, but a slight increase in foreign orders. Reports from Belgrade state that the United Steel Works and the General Electricity Co. have made a joint offer to the Serbian Ministry of Communications to deliver all necessary railroad material during the next few years, including locomotives, cars, rails, signaling apparatus and construction machinery and equipment, on terms of 10 to 15 years' credit.

Three South-German locomotive-manufacturing corporations, the S $\ddot{a}$ chsische Maschinenfabrik of Chemnitz, Maschinenfabrik Esslinger of Neckar and Maschinenbau A. G. of Karlsruhe, have entered into a col-

laboration agreement. This move is in opposition to the agreement made in August between the four North-German companies, Henschel, Borsig, Schwartzkopff and Maffei, and the aim is to defend state rights as guaranteed by the Railroads Law of 1920. Under this law the state railroads passed under control of the Reich, but orders for materials and equipment were to be distributed among the former railroad-owning states as before. Prussia was to receive 88.4 per cent of locomotive orders, Bavaria 4.9 per cent, Saxony 3.16 per cent, W $\ddot{u}$ rttemberg 1.41 per cent, and Baden 2.13 per cent. The South-German companies consider that the North-German combination is a threat to their rights, and it demands that the state quotas shall be increased and not reduced.

The Automobile Manufacturers' Association reports extremely good business. This year production of private cars exceeded that of 1927 by 36 per cent and sales by 39 per cent. The association points out that Germany's automotive production this year has shown a greater percentage of increase than that of any other country in the world. Eighteen leading bicycle-manufacturing firms have agreed to form an association in the general interest of efficient production and to combat over-production. Fixing of production quotas is expected to follow. Solingen cutlery manufacturers have formed a commission to determine the best methods of carrying on a joint publicity campaign. Domestic business in cutlery is dull and export, after averaging more than 600 metric tons a month early in the year, declined in July by about 20 per cent. No improvement is expected until the Christmas demand develops.

German Steel Workers Demand Increase

(By Radio)

BERLIN, GERMANY, Oct. 1.—All syndicates' domestic prices are unchanged for October. The Steelworkers' labor union has denounced the wage agreements and demands increases. The employers have refused and declare that if the demand is persisted in a general advance in steel prices will ensue.

The European Rail Makers' Association has increased prices by 2s. 6d. (61c.) per ton. The International Tube Cartel has retained its prices unchanged.

The pig iron market is quiet and export is declining. The domestic steel market is more active, orders being placed in expectation of a rise in prices. The export market is firm with a heavy overseas demand for steel bars.

Pig iron and steel production are slowly declining. The output of pig iron in the first eight months of this year exceeds the output in the same months of 1927, but the production of steel and rolled products is slightly less than 1927.

Largest Exports Since February, 1921

One-Fourth of August Total Was Scrap—Imports
Much Above July and Slightly Higher
Than a Year Ago

WASHINGTON, Sept. 28.—Aggregating 287,297 gross tons, exports of iron and steel products from the United States in August were the largest since February, 1921, when they amounted to 393,328 tons, and exceeded the July, 1928, exports of 253,336 tons by 33,961 tons, or 13.4 per cent. For the eight months ended Aug. 31, exports were 1,899,375 tons, or 399,664 tons above the 1,499,711 tons exported for the corresponding period of last year, a gain of 26.6 per cent. Exports for the eight months of 1928 moved at a higher monthly average, approximately 249,000 tons, than for any period since 1920, when the average was 392,400 tons. The total for the calendar year will greatly exceed 2,000,000 tons, which, it is understood, the railroads required before making permanent the temporary reduction of 20 per cent in freight rates on export shipments of

iron and steel beginning last January.

Imports in August were 69,914 tons—22,084 tons, or 46.2 per cent above the 47,830 tons in July. For the eight months ended Aug. 31 however, imports dropped 1 per cent, to 507,639 tons from 512,942 tons in the corresponding period of last year.

Scrap exports in August—70,538 tons—set a record for all time, and aided materially in swelling the total outgoing shipments of iron and steel. Of the scrap exports, 27,006 tons went to Japan, 24,536 tons to Italy, 9458 tons to Canada, 7834 tons to Poland and Danzig, and 863 tons to Mexico. Record shipments of scrap also were made during the eight months ended Aug. 31, with a total of 364,776 tons. Each of the last five months has registered above 40,000 tons, a figure never reached but once before (September, 1920).

The average daily shipment of exports in August was 9268 tons—higher than in any month for some time past, and comparing with 8172 tons in July. The daily average export movement for the eight-month period ended Aug. 31 was 7784 tons. Gains in exports in August were made in 16 classes, scrap rising 26,755 tons over July, while rails with a total of 23,999 tons made a gain of 12,920 tons. Decreases were made in shipments of plain structural material, with a loss of 7440 tons; plates, with a reduction of 2449 tons, galvanized sheets with a decrease of 1760 tons, and steel bars with a drop of 1382 tons.

For the eight months scrap represented 19 per cent of the exports; tin plate, 8.9 per cent; boiler tubes and welded pipe, 8.85 per cent; rails, 7.6 per cent; black steel sheets, 6.8 per cent; plain shapes, 6.25 per cent;

galvanized sheets, 5.5 per cent; plates, 5.2 per cent; steel bars, 5.1 per cent, and ingots and semi-finished material, 4.7 per cent.

Of the rails exported in August, 4466 tons went to Canada, 2071 tons to Brazil, 1208 tons to Mexico and 929 tons to Japan. Tin plate exports in August, amounting to 22,374 tons, were widely distributed, Canada taking 4775 tons; Japan, 4025 tons; Argentina, 3099 tons; Brazil, 1355 tons, and Mexico, 1113 tons. Of the 19,069 tons of black steel sheets exported during the month 9291 tons went to Canada and 7719 tons to Japan. Canada took 2613 tons of the 12,199 tons of plates exported in August and 2613 tons of the 13,581 tons of galvanized sheets exported that month, while the Philippine Islands took 2232 tons of the latter. Of the 12,517 tons of steel bars exported in August, Canada took 8145 tons and the United Kingdom 1766 tons. Venezuela was the destination of 7730 tons of the 15,164 tons of casing and oil line pipe exported during the month, while 2954 tons went to Java and Madura and 1223 tons to Mexico. Of the 10,214 tons of black welded pipe exported during the month, 1933 tons went to Canada, 1443 tons to Japan, 1300 tons to Argentina and 1241 tons to Venezuela.

Increases in the eight months' exports ended Aug. 31, over the corresponding period of last year, were made in 27 classes and were most marked in scrap, ingots and semi-finished steel, plain structural shapes, steel bars and rails. The principal losses were in tin plate, boiler tubes and welded pipe and galvanized sheets.

Of the August exports, Canada, continuing in first position, took 95,314 tons; for the first eight months the total going to that country was 563,980 tons. Japan and Chosen took 51,482 tons in August and 189,001 tons during the eight months.

August imports showed gains in 20 groups, chiefly in structural shapes, whose total of 19,084 tons reflected an increase of 7892 tons over the July

imports of this product. Pig iron, with a total of 12,990 tons, showed an increase of 6935 tons over July, and steel bars, with a total of 8270 tons, a gain of 3278 tons. Imports declined in six groups, but only two, cast iron pipe and rails, were of importance, the former showing a drop of 1443 tons and the latter a decrease of 523 tons. Of the pig iron imports, 7485 tons came from India and 2550 tons from the United Kingdom. Of the

United States Imports of Iron and Steel Products in August

imports of steel bars, 2641 tons came from France, 2637 tons from Belgium, 1754 tons from Germany and 1104 tons from Sweden. Of the plain shapes imported in August, 10,816 tons came from Belgium, 5100 tons from France and 2709 tons from Germany.

Of the 6288 tons of cast iron pipe imported that month, 4763 tons came from France and 1523 tons from Belgium. "Other pipe" imports, chiefly seamless tubes, totaled 4456 tons, of which 1938 tons came from Germany, 1216 tons from the United Kingdom, 538 tons from Poland and Danzig, 398 tons from Canada and 136 tons from France. Of the 911 tons of rails imported in August, 823 tons came from Canada.

Belgium led as the greatest single

source of imports in August, providing 17,367 tons. France was second with 14,138 tons, and Germany was third with 10,267 tons. Canada furnished 7819 tons, and India, 7495 tons.

Higher Production of Malleable Castings

Production of malleable castings in August is reported by the Department of Commerce at 61,833 tons, compared with 54,373 tons in July and with 51,394 tons in August of last year. Except for last March, the August tonnage was the highest since March, 1927. Shipments in August were 58,914 tons, a gain of 10 per cent over the July shipments of 52,694 tons. These figures compare with 50,258 tons in August, 1927.

Orders booked, at 56,415 tons, were somewhat less than the month's production, but represented the largest amount since last March and, with that exception, the largest since February, 1927. Capacity was engaged in August to the extent of 68.5 per cent.

For the first eight months, production was 472,508 tons against 450,692 tons last year. Shipments were 450,676 tons against 440,620 tons in 1927. Orders booked were 436,761 tons against 402,913 tons last year. All figures are from 130 "identical" plants.

A new oxygen plant of the Linde Air Products Co. has started operations at Akron, Ohio. It will supply the nearby demand for oxygen used in welding and cutting by the oxy-acetylene process.

The fall meeting of the American Refractories Institute, originally scheduled for Pittsburgh, has been transferred to the Vanderbilt Hotel, New York. The date of the meeting is Oct. 24.

Machinery Exports Continue Heavy

August Shipments Only 7.3 Per Cent Below

July—Agricultural Implements 31

Per Cent of Total

WASHINGTON, Sept. 28.—Exports of machinery of all kinds in August aggregated \$44,303,235 in value, against \$47,814,163 in July, the latter having set the highest record in seven and one-half years. The August shipments were almost \$3,000,000 in excess of those of August of last year, when the total value was \$41,042,546. For the eight months ended Aug. 31, 1928, the total of \$331,863,954 was \$38,900,988 in excess of similar shipments for the corresponding period of last year, with a total of \$292,962,966.

Exports of industrial machinery in August were valued at \$19,173,465, compared with \$21,094,582 in July and with \$17,493,611 in August, 1927. For the eight months ended Aug. 31, exports of industrial machinery were valued at \$149,488,032, against \$136,117,937 for the corresponding period of last year. Exports of power-driven metal-working machinery in August were valued at \$2,650,532, compared with \$2,562,201 in July and with \$1,683,994 in August of last year. For the eight months ended Aug. 31, exports of this class of ma-

chinery were valued at \$17,357,134, against \$12,193,040 for the corresponding period of 1927.

Exports of power-driven metal-working machinery listed in THE IRON AGE table numbered 833 in August, valued at \$1,712,938, against 1111, valued at \$1,734,060, in July.

Following the trend that was so pronounced in July, exports of machinery in August were raised to their high level largely by reason of the heavy shipments of agricultural implements, which were valued at \$13,697,000, a drop of only 2.1 per cent from the record-breaking \$13,996,000 of July.

Imports of machinery and vehicles in August were valued at \$2,729,543, compared with \$2,306,665 in July and with \$1,895,311 in August of last year. For the eight months ended with August, the value was \$18,970,787, against \$18,904,646 for the corresponding period of last year. Imports of industrial, office and printing machinery in August amounted to \$1,829,834, against \$1,516,328 in July and \$1,215,700 in August of last year.

For the eight months ended with August, the total was \$11,776,942, compared with \$11,326,725 for the corresponding period of last year.

Imports of machinery listed in THE IRON AGE table were valued in August at \$2,081,751, against \$1,606,365 in July and \$1,270,993 in August of last year. For the eight months ended with August, the value was \$13,916,841, against \$13,061,582 for the corresponding period of last year, showing a gain of 6½ per cent.

Drop in Steel Boiler Orders

Orders for steel boilers in August covered 1649 units, with 1,459,652 sq. ft. of heating surface. This was the smallest amount since May, although the differences have been slight. It compares with 1,528,053 sq. ft. in July and with 1,568,536 sq. ft. in August of last year. In the first eight months of 1928 the total was 10,582,669 sq. ft., a drop of about 10 per cent from the 11,619,091 sq. ft. of the corresponding period in 1927.

Machinery Markets and News of the Works

Machine Tool Trade Active

September Orders Closely Approximated Those of August—
Automobile Companies Buying

MACHINE tool orders turned upward in the last week of September, and the total for the month closely approximated that of August, which was an unusually good month. Automobile manufacturers and companies making automobile parts and accessories contributed a considerable share of recent business, though the diversification of buying was an outstanding feature.

Moreover, the volume of pending business indicates that there will be no marked letdown in purchases this month. Production in machine tool plants in the Cincinnati district is being maintained at the highest rate since 1919-1920. Unfilled orders at many plants have increased to an extent which, with normal business during the next month or two, assure steady operations during the remainder of the year. Orders taken by Chi-

cago dealers in the first nine months of the year were the largest for any like period since 1920.

Although railroad buying is conspicuously light, the orders from general industrial lines are extremely satisfactory in volume. The changes in models by some of the automobile companies have resulted in needs for new equipment.

Chicago trade prospects are enlivened by the report that the International Harvester Co. will probably spend about \$500,000 for equipping its Rock Island, Ill., plant, and the Allis-Chalmers Co., West Allis, Wis., is making a survey of equipment needed for the production of a light farm tractor. The Seaman Body Corporation, Milwaukee, and the Nash Motors Co., Racine, Wis., will shortly make extensive purchases for new plant additions.

New York

NEW YORK, Oct. 2.—The volume of inquiry for machine tools is steady and comes from widely distributed sources. Although there are few buyers of large lots, numerous orders for single tools are being received. R. Hoe & Co., New York, recent purchasers of a large Ingersoll milling machine, are considering the purchase of another, which will probably reduce the number of planers to be bought. Other new equipment may also be required by this company. The General Electric Co. continues as a buyer of machine tools for Schenectady, having ordered a shaper, a bending machine and a lathe last week. New inquiries call for eight 16 and 18-in. engine lathes and a No. 2 Baker key-seating machine. Manufacturers of airplanes are not active buyers of tools, except the Curtiss Aeroplane & Motor Co., Buffalo, which is buying a few single tools for its Buffalo plant.

Niles-Bement-Pond Co. reports following sales: Three No. 3 axle lathes, a combination journal turning and axle lathe, two 30-in. x 22-ft. Time-Saver lathes,

three Morris radial drills, a Cincinnati 6-in. high-speed automatic tapper, a Cincinnati high-speed 4-spindle drill, a Ransom grinder and a Boye & Emmes 18-in. x 12-ft. lathe. Pratt & Whitney division sold six lathes, a No. 10 hand milling machine, one 8-in. rotary surface grinder and two 14-in. vertical surface grinders, an automatic worm grinder, a 3A universal die sinker, a No. 2 jig boring machine and a 12-in. vertical shaper.

Plans have been approved by Ford Motor Co., Detroit, for expansion and improvements at Green Island, N. Y., plant, with installation of equipment for manufacture of shock absorbers of about 6000 units per day. Parts, assembling and service work as heretofore handled at this plant will be discontinued.

Board of Trustees, American Museum of Natural History, Columbus Avenue and Seventy-seventh Street, New York, has plans for a five-story power plant and service building to cost more than \$750,000 with equipment. Trowbridge & Livingston, 527 Fifth Avenue, are architects and engineers.

Packard Motor Car Co. of New York, Broadway and Sixty-first Street, has awarded general contract to Turner Construction Co., Graybar Building, for new eight-story service, repair and sales

building on Eleventh Avenue, extending from Fifty-fourth to Fifty-fifth Street, to cost about \$1,500,000 with equipment. Plant at Long Island City will be removed to new location and additional machinery provided. Albert Kahn, Marquette Building, Detroit, is architect; Frank S. Parker, 119 West Fifty-seventh Street, New York, is associate architect.

Steel & Tubes, Inc., Scott Avenue, Brooklyn, has plans under way for one-story addition, to cost over \$50,000 with equipment. Austin Co., 120 Broadway, New York, is architect and engineer.

Union Free School District No. 9, Pleasantville, N. Y., is said to be planning installation of manual training equipment in a proposed high school to cost about \$400,000. Tooker & Marsh, 101 Park Avenue, New York, are architects.

New York Railways Corporation, 123 West 146th Street, New York, has filed plans for a two-story motor bus garage, service and repair building at Lexington Avenue and 100th Street, to cost about \$100,000 including equipment.

F. J. Ross, 4200 White Plains Avenue, New York, architect, has plans for a multi-story automobile service, repair and garage building, 100 x 100 ft., to cost over \$150,000 with equipment.

Funk Printing Press Co., 150 Nassau Street, New York, manufacturer of printing presses, parts, etc., has acquired property between Princeton Junction and Plainsboro, N. J., for new plant, with one-story initial unit, 40 x 400 ft., to cost over \$100,000 with equipment. Company will establish new industrial community, with housing development for employees.

Brinkerhoff Electric Co., 171 Franklin Street, New York, manufacturer of electric lamps, etc., has plans for new two-story and basement plant, with foundations for third story, at West New York, N. J., 70 x 180 ft., to cost more than \$75,000 with equipment. Lockwood, Greene & Co., 1 Pershing Square, New York, are architects and engineers.

Newark Transformer Co., 17 Frelinghuysen Avenue, Newark, manufacturer of electric power equipment, has engaged Joseph Kennedy, 44 Grove Street, Arlington, N. J., architect, to prepare plans for two-story plant, 25 x 100 ft., on Sherman Avenue, to cost about \$40,000 with machinery.

Lackawanna Railroad Co., 90 West Street, New York, is planning for electrification of portion of suburban system from Hoboken to Dover, N. J., and vicinity, 173 miles, to overhead contact system, to cost \$14,000,000 with equipment, exclusive of power plant. Construction of steam-operated electric generating plant on Hackensack River, where property has been secured, is under consideration, to cost about \$4,000,000. Project is scheduled for completion within 15 to 18 months.

Gates-Day Aircraft Corporation, 909 East Twenty-third Street, Paterson, N. J., manufacturer of commercial and military planes, etc., is disposing of a common

The Crane Market

NEW inquiry for both electric overhead and locomotive cranes continues rather small. Some fair business is evidently in prospect from subway contracts about to be awarded in New York and for which contractors have been asking prices on crawl-tread locomotive cranes, truck cranes and steam shovels. One such contract requires a crane and a steam shovel with boom to operate in a tunnel with 17-ft. of headroom. One of the larger locomotive crane inquiries pending at present is a list of six small crawl-tread cranes for the Pennsylvania

Railroad. But little new inquiry has developed for overhead crane equipment, but there is a good volume of old inquiries in the market, several of which are expected to close soon. The Missouri Public Service Commission has authorized the Missouri Pacific Railway and the Universal Carloading Co. to install a gantry crane at the railroad's freight house at Second and Biddle Streets, St. Louis.

Among recent purchases are:

Western Electric Co., Kearny, N. J., 5-ton, 95-ft. span, electric crane from Cleveland Crane & Engineering Co.

Pittsburgh Pipe & Coupling Co., 5-ton, 45-ft. span crane from Box Crane & Hoist Corporation.

Deere & Co., Moline, Ill., ¾-yd., 80-ft. span crane and 5-ton, 3-motor, 86-ft. span overhead electric crane from Milwaukee Electric Crane & Mfg. Corporation.

McClintic-Marshall Co., Marova Plant, Chicago, 15-ton, 5-ton auxiliary, 80-ft. span overhead electric crane from Milwaukee Electric Crane & Mfg. Corporation.

stock issue to total \$3,000,000, part of fund to be used for expansion in output. Company also operates a subsidiary, Gates Flying Circus & Aviation Co., Teterboro, near Paterson. Ivan R. Gates is president.

Royal-Dutch-Shell Co., London, England, operating Asiatic Petroleum Co., 65 Broadway, New York, and other properties in United States, has purchased substantial interest in Flintkote Co., Rutherford, N. J., manufacturer of roofing products, and will take active part in management. A fund of about \$9,000,000 will be secured by Flintkote organization, a portion to be used for expansion in plants and facilities. Factories are being operated at Rutherford, Cincinnati, Chicago Heights, and New Orleans. Headquarters are at 31 St. James Avenue, Boston.

American Telephone & Telegraph Co., 195 Broadway, New York, has plans under way for new testing and repeater station, four stories, 45 x 76 ft., at Morristown, N. J., to cost about \$100,000 with equipment. Voorhees, Gmelin & Walker, 101 Park Avenue, New York, are architects.

International Oxygen Co., Newark, has taken over business of Tariffville Oxygen & Chemical Co., Tariffville, Conn., and has organized Tariffville Oxygen Co. as New England division of International company. New company will continue manufacture of oxygen, hydrogen and acetylene and will also handle products of International company.

Chicago Watchman's Clock Co., Inc., has removed its New York office to 70 East Forty-fifth Street, in charge of H. R. Kirkland and John G. Earl. August H. Nanz is no longer connected with company.

New York Central Railroad Co., Grand Central Terminal, New York, has awarded general contract to Walsh Construction Co., Herald Building, Syracuse, N. Y., for one and two-story repair shop at Garrison, N. Y., including signal station, to cost \$40,000 with equipment.

Buffalo

BUFFALO, Oct. 1.—Property at Tonawanda, N. Y., has been acquired by Curtiss Aeroplane & Motor Co., Kail Street, Buffalo, as site for new works, and plans for initial unit will be drawn soon. It will be equipped for production of aircraft motors for commercial purposes, including parts manufacture and assembling, and will cost more than \$750,000.

Ritter Dental Mfg. Co., 404 West Avenue, Rochester, N. Y., is said to be ar-

ranging early call for bids on general contract for one-story addition to manufacture dental chairs, instruments, etc., to cost about \$200,000 with equipment. C. A. Carpenter, Temple Building, is architect.

Francis E. Cunningham, 10 South Goodman Street, Rochester, and associates have organized Cunningham-Hall Aircraft Corporation, with capital of \$350,000, and plan early operation of plant to manufacture commercial airplanes and parts. James C. Dryer, East Avenue, Brighton, N. Y., is also interested in company.

Binghamton Light, Heat & Power Co., Binghamton, N. Y., is arranging an expansion and improvement program, including construction of high-tension transmission line from city to Scranton, Pa., about 80 miles, with power substations, switching stations, etc., to cost more than \$250,000. Company is under direction of General Gas & Electric Corporation, 50 Pine Street, New York.

Metallurgical Equipment & Supply Co., Binghamton, N. Y., care of Samuel Tour, 123 North Street, Batavia, N. Y., recently organized by Mr. Tour and associates with capital of \$50,000, plans operation of local plant to manufacture furnaces and machinery for metallurgical production. Walter N. Grounseil, 60 Johnson Avenue, Binghamton, is also interested in company.

South Atlantic

BALTIMORE, Oct. 1.—Locke Insulator Corporation, Charles and Cromwell Streets, Baltimore, manufacturer of high-tension electric insulators, is planning a one-story addition to cost about \$45,000 with equipment.

Baltimore & Ohio Railroad Co., Baltimore, has approved plans for a group of electrically-operated pumping stations and water treating plants on Cumberland division, to cost about \$1,000,000 with machinery, including sites at Evitts Creek, Md.; Green Spring, Sir John's Run, Miller, Martinsburg and Brunswick.

J. E. Sperry, Calvert Building, Baltimore, architect, has plans for multi-story automobile service, repair and garage building, to cost over \$450,000 with equipment.

Richmond Car Works, Inc., Richmond, Va., subsidiary of Standard Steel Car Co., Frick Building, Pittsburgh, is arranging an expansion and improvement program, including additional building units and new equipment to cost close to \$500,000.

Board of Education, Raleigh, N. C., is considering installation of manual training equipment in new three-story and basement high school, to cost \$280,000, for which superstructure will soon begin. William H. Dietrick, Professional Building, is architect.

Public Improvement Commission, City Hall, Baltimore, has authorized appropriation of \$608,000 for extensions and improvements in Vernon pumping plant, with installation of electrically-operated pumping machinery and auxiliary equipment, to replace present Mount Royal steam-operated pumping station, which will be abandoned. Charles F. Goob is chief engineer.

Dixie Aircraft Corporation, Lynchburg, Va., R. S. Skinner, president, has purchased 65-acre tract near Hampton, Va., as site for new airport, including hangar, service and repair building and other units. An airplane assembling plant is under consideration. Project will cost approximately \$65,000.

General Purchasing Officer, Panama Canal, Washington, is asking bids until Oct. 17 for air compressor, boiler, pump, gasoline engine, bolts, nuts, reamers, wire rope, insulated wire, and other equipment. Panama Schedule 1904.

American Enka Corporation, 114 East Thirty-second Street, New York, plans construction of a power station, pumping plant, machine shop and other units at proposed rayon mill on 2100-acre tract near Asheville, N. C., entire project to cost more than \$6,000,000.

Steuart Brothers, Inc., 151 Twelfth Street, N. E., Washington, is planning construction of four-story automobile service, repair and garage building on Fifth Street, N. E., to cost about \$130,000 with equipment.

Taylor Iron Works & Supply Co., Broadway, Macon, Ga., is planning construction of one-story foundry, boiler shop and pattern works, to double present capacity, to cost over \$60,000 with machinery.

New England

BOSTON, Oct. 1.—Used tool dealers appear to have been more active than new the past week, a condition that has not developed for a long time. In general dealers in this line of equipment have done more business than in several weeks. Presses, small and medium, screw machines, and lathes from 12 to 24-in. have been the best sellers. A Connecticut used tool dealer has sold automatic machinery, very largely turret lathes and

gear and screw making equipment, in the Massachusetts and Rhode Island territories with satisfying results. The same dealer reports larger sales in Connecticut during September than in any month since early spring.

Local dealers in new tools have been handicapped by the sale of the excess tools of the abandoned Lowell plant of the Saco-Lowell Shops. The best of this equipment has been sold. Inquiries for new tools are more numerous, especially for high priced production units.

Small tools are moving well and September sales by some houses have established a new high record for this year.

Davidson Fan Co., 15 Brooks Street, Newton, Mass., has awarded contract for a new two-story, 50 x 100 ft., plant.

City of Springfield, Mass., has started work on a two-story, 137 x 180 ft., junior high school addition to contain vocational shops. E. C. and G. C. Gardner, 35 Lyman Street, Springfield, are architects.

Builders Iron Foundry Co., Coddington Street, Providence, has started work on a one-story plant, 44 x 103 ft. It is understood that all of the necessary equipment has not been purchased.

City Council, Cranston, R. I., is considering installation of seven pumping plants in connection with extensions and improvements in municipal sewage system, with waste disposal and treating plants, to cost \$2,826,500. A fund of \$2,500,000 has been authorized by State legislature for work. Fay, Spofford & Thorndike, 44 School Street, Boston, are consulting engineers.

Board of Education, Hartford, Conn., has authorized installation of manual training department in addition to be built at Alfred Plant junior high school, West Hartford, for which bids will soon be asked on general contract. Russell F. Baker, Hartford, is architect.

National Packaging Machine Co., 445 Watertown Street, Newtonville, Mass., has awarded general contract to F. L. Fox, 101 Milk Street, Boston, for a four-story addition, to cost over \$60,000 with equipment.

Packard Motor Car Co., 1089 Commonwealth Avenue, Boston, is revising plans for new four-story service, repair and sales building, 115 x 230 ft., to cost over \$200,000 with equipment. Albert Kahn, Marquette Building, Detroit, is architect and engineer.

New Departure Mfg. Co., Bristol, Conn., has let contract to Aberthaw Co., Boston, for one-story addition to forge shop, 130 x 200 ft.

Milwaukee

MILWAUKEE, Oct. 1.—Estimates of September machine-tool business indicate about the same average as August, and for many plants October opens with a large volume of orders. The outlook is considered very favorable, and production schedules will probably have to be kept at the present level until after Jan. 1 to make specified deliveries. Local buying of equipment continues excellent.

Allis-Chalmers Mfg. Co., Milwaukee, is about to purchase equipment for its tractor department at main works in West Allis for production of a small tractor to supplement line of farm tractors.

Northwestern Steel & Iron Works, Eau Claire, Wis., has placed contracts for a one-story addition, 48 x 100 ft.

Advance Car Mover Co., 930 East John Street, Appleton, Wis., is building a new factory to manufacture a device to move freight cars in yards by manual means. General contract has been let to Austin Co., Cleveland.

Chicago & North Western Railway Co., 226 West Jackson Boulevard, Chicago, contemplates erection of a new round-house, machine shop and storage building at Iron River, Mich.

John Strange Paper Co., Washington Street, Menasha, Wis., has plans by Orbison & Orbison, consulting engineers, Appleton, Wis., for a new boiler house to cost about \$75,000.

Bids close Oct. 16 in office of John Jedwabny, Jr., city clerk, Menasha, Wis., for construction and equipment of an addition to municipal water and light plant to cost \$75,000. An additional Diesel engine with generator, motors, switch-board and appurtenances is specified.

Maynard Electric Steel Casting Co., 1328 Twenty-second Avenue, Milwaukee, has placed contracts for construction of a one-story foundry addition, 100 x 121 ft.

C. C. Nielson and Axel O. Nielson have acquired interest of John C. Burkell in Nielson Machine Co., Racine, Wis., and will continue business under original title.

Philadelphia

PHILADELPHIA, Oct. 1.—Plant of McFarland-Meade Co., Seventy-first Street and Kingsessing Avenue, Philadelphia, on 2-acre tract heretofore used for manufacture of metal sash, doors, etc., has been acquired by Wilkening Mfg. Co., Fifteenth and Mount Vernon Streets, operating Duoflex Piston Ring Co., and will be occupied by last noted organization. Present plant will be removed to new location and additional equipment installed. F. W. Wilkening is president.

United States Gypsum Co., Chicago, has authorized construction of new plant for manufacture of gypsum products on 7-acre tract at Fifty-eighth Street and Schuylkill River, Philadelphia. Initial units will cost over \$500,000 with machinery. Company is said to contemplate paper mill at same location.

Heintz Mfg. Co., Front and Olney Streets, Philadelphia, manufacturer of steel automobile bodies, has asked bids on general contract for a one-story addition, to cost about \$27,000.

General Motors Truck Co., Twenty-third and Carpenter Streets, Philadelphia, with headquarters at Pontiac, Mich., has arranged for erection of new service, repair and sales building at Wilmington, Del., to be built by E. M. Harris, 2214 Chestnut Street, Philadelphia, to cost \$250,000 with equipment.

Hercules Powder Co., Wilmington, Del., is carrying out an expansion program at Parlin, N. J., including construction of several new buildings, with compressor plant, 60 x 90 ft. Air compressors, pumps, tanks and other equipment will be installed. Project will cost more than \$150,000.

Hobson Flatware Co., Lansdale, Pa., manufacturer of chromium and nickel plated ware, has taken option on two-acre tract at Lambertville, N. J., as site for new plant, and plans to break ground for first unit this month. It is reported to cost about \$75,000 with equipment. Works at Lansdale will be removed to new location.

Pennsylvania Gypsum Co., Chester, Pa., has approved an expansion and improve-

ment plan at local mill, with installation of additional machinery for manufacture of gypsum building products. A new pier will be built and equipped with unloading, conveying and other apparatus for handling gypsum rock. Company is said to be projecting plans for new plant at Brooklyn.

Board of Education, Kingston, Pa., is said to be planning installation of manual training equipment in new two-story high school to cost \$750,000, for which superstructure will soon begin. Mack & Sahm, Coal Exchange Building, Wilkes-Barre, Pa., are architects.

Beaver Saw Filing Machine Co., York, Pa., care of Robert F. Fluhrer, York, attorney, now being organized by local interests, is planning early operation of plant for manufacture of tools for sharpening hand and circular saws and kindred equipment.

Reading Iron Co., Reading, Pa., will establish a new cut nail and galvanizing plant at Pottstown, Pa. Present unit at Birdsboro, Pa., will be discontinued and equipment removed to Pottstown mill where facilities will be provided for larger output.

Keystone Aircraft Corporation, Bristol, Pa., is planning an expansion and improvement program, including installation of additional equipment. Arrangements are being made for sale of stock to an amount of \$1,050,000, a portion of fund to be used for extensions.

Lehigh Valley Coal Co., Wilkes-Barre, Pa., is reported planning construction of new electrically-operated coal breaker between Maysville and Kulpmont, to cost more than \$500,000 with machinery.

American Telephone & Telegraph Co., 15 Dey Street, New York, has awarded contract to Morton C. Tuttle Co., Boston, for design and construction of transoceanic telephone transmitting station at Lawrenceville, N. J. Development will include two buildings, 76 x 96 ft. and 60 x 76 ft., two stories and basement. Antenna system 4500 ft. long on steel towers will transmit to Europe, and development will later include circuits to South America.

Chicago

CHICAGO, Oct. 1.—September sales of machine tools have been numerous and the month closes only a trifle less active than August. Orders taken by Chicago dealers in the first nine months of 1928 establish a record for similar periods since 1920 and fresh inquiry gives promise that October business will be large. Outstanding among prospects is a probable purchase of \$500,000 worth of machine tools by the International Harvester Co. for its Rock Island, Ill., plant.

Allis-Chalmers Mfg. Co. is expected to purchase some equipment to manufacture a light tractor at its West Allis plant. Seaman Body Corporation, Milwaukee, and Nash Motors Co., Racine, Wis., will make early purchases for plant additions. Miscellaneous business is active. Chicago, Rock Island & Pacific has ordered two planer-shapers.

Work has been started on foundation of a 60 x 120-ft. addition for Lappen Foundry, Crookston, Minn.

Plans are being completed by All-Steel Equipment Co., Griffith Avenue, Aurora, Ill., manufacturer of factory and office equipment and fixtures, for a one- and two-story addition to cost \$25,000. Her-

bert E. Spieler, Graham Building, is architect.

General Engineering Works, 340 West Huron Street, Chicago, manufacturer of screw machine products, has purchased property on West Division Street for new one-story plant, to cost more than \$85,000 with equipment.

General Laundry Machine Co., 1223 South Talman Avenue, Chicago, has authorized plans for a new one-story plant, to cost close to \$100,000 with equipment. F. E. Davidson, 53 West Jackson Boulevard, is architect.

Public Service Co. of Colorado, Fifteenth Street, Denver, has awarded a general contract to F. H. Cowell, Central Savings Bank Building, for a new equipment storage and distributing plant, with repair department, to cost about \$110,000 with machinery.

Elco Tool & Screw Co., Rockford, Ill., has awarded general contract to Bakken & Anderson, 1102 Broadway, for rebuilding portion of two-story plant recently destroyed by tornado, to cost over \$150,000 with equipment. Peterson & Johnson, Swedish-American Bank Building, are architects.

City Council, Baudette, Minn., is considering installation of municipal electric light and power plant, using Diesel engine units, to cost about \$30,000.

Washburn-Crosby Co., Chamber of Commerce Building, Minneapolis, Minn., is said to be planning to rebuild part of flour mill A, recently destroyed by fire, with loss of about \$200,000 including equipment.

Knapp Brothers Mfg. Co., Cicero, Ill., manufacturer of metal building products, metal trim, etc., has plans for new one-story plant at Joliet, Ill., 120 x 600 ft., to cost over \$100,000 with equipment.

Michael George Pen Co., Grand Haven, Mich., manufacturer of fountain pens, has approved plans for a new one-story plant, 60 x 145 ft., at Libertyville, Ill., to cost about \$65,000 with equipment.

Martin Machine Works formerly at 228 South Laffin Street, Chicago, is now located in new quarters at 2234-36 Walnut Street.

Cincinnati

CINCINNATI, Oct. 1.—Machine tool buying took an upward turn the past week with the result that sales, in September closely approximated those in August. Automobile manufacturers and companies making automobile parts have continued to supply the bulk of current business, although the diversified sources of recent bookings testify to the healthy condition of industry in general. Builders specializing in equipment for automobile makers report signs of an expansion in demand for their product in the Detroit district.

The volume of pending orders is unusually heavy and indicates no let-down in purchases of machine tools for at least the next month. Production in local plants is being maintained at a high rate with the largest number of workers since 1919-1920. Unfilled orders have accumulated to such an extent that a slowing up in operating schedules may not come before the end of the year. A local company has received an order for four special lathes, valued at approximately \$35,000, from Europe. A Detroit company has contracted for five large lathes.

Contract has been let by Container Corporation of America, Inc., 5500 East-

ern Avenue, Cincinnati, manufacturer of corrugated board products, to Rust Engineering Co., Pittsburgh, for two-story addition, 180 x 300 ft., to cost more than \$200,000 with machinery. Devore Co., Toledo, Ohio, is architect and engineer.

Cincinnati Oakland Motor Car Co., 1926 Gilbert Avenue, Cincinnati, local representative for Oakland automobile, is having plans drawn for one and two-story service, repair, assembly and garage building, to cost over \$100,000 with equipment. H. Neilson Jackson, Mercantile Library Building, is architect.

Wessling Brothers Foundry Co., Liberty and McLean Streets, Cincinnati, has acquired tract on Johnson Street, and plans new one-story foundry to cost close to \$110,000 with equipment. Present business will remove to new location.

Louisville Gas & Electric Co., Louisville, has increased stock from \$45,000,000 to \$90,000,000, a portion of proceeds to be used for expansion and improvements. Company has been carrying out new hydroelectric power development at Ohio Falls.

Mead Pulp & Paper Co., Chillicothe, Ohio, is planning an expansion and betterment program at local mill, to include installation of paper-making equipment, coating machine and auxiliary equipment, to cost more than \$175,000. An addition will be built also to branch mill at Kingsport, Tenn.

Meehanite Metal Wheel Co., Chattanooga, Tenn., recently organized by Gus Meehan, head of Meehan Foundry Co., Chattanooga, and associates, with capital of \$25,000, is planning operation of local plant. New company is represented by C. A. Noone, First National Bank Building.

Armstrong Furnace Co., London, Ohio, M. B. Armstrong, president, has plans for new one-story plant at Columbus, Ohio, to cost about \$40,000 with equipment.

Harriman Mfg. Co., Harriman, Tenn., manufacturer of cultivators and other agricultural equipment, has been merged with W. J. Oliver Plow Co., Knoxville, Tenn., manufacturer of kindred products. First noted company name will be retained by consolidated organization. Proposed to discontinue plant at Knoxville during November, removing equipment to Harriman works which will be extended.

L. E. Lowe & Sons Machine Works, Columbus, Ohio, has been removed to 518 East Beck Street, and is in production.

St. Louis

ST. LOUIS, Oct. 1.—P. Jacks Co., 119 North Seventh Street, St. Louis, will soon begin superstructure for one-story tin and metal-working shop, 100 x 126 ft., to cost about \$26,000 with equipment. Edward J. Gieseler, DeMenil Building, is architect.

Pearl Mining Co., Picher, Okla., is planning to rebuild ore mill at its Patty C zinc and lead mining properties, recently destroyed by fire, with loss of over \$75,000 including machinery.

Greenleaf-Moore Cadillac Co., 1201 South Main Street, Tulsa, Okla., local representative for Cadillac automobile, is having plans completed for four-story service, repair and sales building, 100 x 140 ft., to cost approximately \$125,000 with equipment. Noble B. Fleming, Commercial Building, is architect.

Eagle Aircraft Co., Kansas City, Mo., is planning an expansion program, including additional units and installation of equipment. Company is arranging for

sale of 200,000 shares of stock, considerable part of proceeds to be used for work.

Board of City Trustees, Spiro, Okla., is planning extensions and betterments in municipal electric light and power plant to cost \$40,000.

Missouri Pacific Railroad Co., St. Louis, is said to be planning to rebuild engine house with repair facilities at Lincoln, Neb., recently destroyed by fire, with loss of about \$40,000.

City Council, Paris, Ark., is considering extensions and improvements in municipal electric light and power plant, to cost \$50,000 with equipment.

Howokla Oil Co., Allen, Okla., will soon begin work on a new refinery to cost about \$125,000 including equipment.

Kansas City Power & Light Co., Fourteenth Street and Grand Avenue, Kansas City, Mo., has asked bids on general contract for four-story automobile service, repair and garage building, 124 x 142 ft., to cost over \$150,000 with equipment. H. G. Freshman is company architect, in charge.

Board of Education, North Little Rock Special School District, Little Rock, Ark., plans installation of manual training equipment in four-story and basement high school to cost \$500,000. George R. Mann, Wanger & King, New Donaghey Building, are architects.

Pittsburgh

PITTSBURGH, Oct. 1.—The Westinghouse Electric & Mfg. Co. has issued its fourth-quarter list for machine tools and supplies; it contains 57 items and includes more machine tools than the third-quarter list. Reports about September business are somewhat mixed, but on the whole indicate that sales and money value exceeded those of August. The Timken Roller Bearing Co., Canton, Ohio, was among the buyers of the past week. In heavy equipment, the placing by the Davison Coke & Iron Co. of the mills for its new cement plant with the Allis-Chalmers Mfg. Co. is outstanding.

The Columbia Steel Corporation, which is building a six-mill tin plate plant at Pittsburg, Cal., has bought automatic doublers, shears, pickling unit and tin house equipment from Aetna-Standard Engineering Co. Mills and drives for this plant are yet to be placed.

Plans have been approved by Duquesne Light Co., 435 Sixth Avenue, Pittsburgh, for addition to steam-operated electric generating plant on Bruno's Island in Ohio River, with initial capacity of 60,000 kw. Work will include new coal tower, with equipment for unloading barges at rate of 200 tons per hr., and coal-crushing plant. Project will cost more than \$6,000,000 with machinery.

Aircraft & Airways of America, Inc., Farmers Bank Building, Pittsburgh, recently organized with capital of \$300,000, will act as representative for Ryan Aircraft Co., San Diego, Cal., for sales and distribution in Pennsylvania, Ohio, New Jersey and New York. Plans are under way for construction of hangar at Rodgers Field, Pittsburgh, with repair facilities. Company is also reported considering establishment of local assembling plant.

Rainbow Light, Inc., manufacturer of luminous tube electric display equipment, a subsidiary of Rainbow Luminous Products, Inc., Long Island City, N. Y., is establishing a branch plant at Pittsburgh. A similar plant will also be established at

Boston, and an expansion program carried out at Detroit plant.

Whitaker Paper Co., 101 Ninth Street, Pittsburgh, has purchased property on Beaver Avenue for new storage and distributing plant, 140 x 540 ft., to cost about \$200,000 with handling and other equipment.

Kesselman & Co., 128 Ann Street, Parkersburg, W. Va., recently formed with capital of \$100,000, will operate a plant to manufacture oil well equipment and supplies. William H. Kesselman, Parkersburg, is head.

Detroit

DETROIT, Oct. 1.—Baker-Perkins Co., Saginaw, Mich., manufacturer of baking machinery, has awarded general contract to James Kerns & Son, Hess Street, for one-story addition to foundry, to cost \$100,000 with equipment.

O. C. Harrington Co., Jackson, Mich., manufacturer of automobile products, has taken over part of former local No. 9 plant of Earl Motors Corporation, totaling about 50,000 sq. ft. floor space, and will remodel for expansion. Another section of same plant has been secured by Watts-Morehouse Co., Jackson, manufacturer of automobile trunks, for increased production.

Stinson Aircraft Corporation, Northville, Mich., has plans for new plant, including parts and assembling divisions, for larger capacity. Company will dispose of stock issue of 23,500 shares, the majority of proceeds to be used for expansion. Edward A. Stinson is president, and Henry E. Hund, vice-president.

Consumers Power Co., Jackson, Mich., is completing plans for power substation at Saginaw, Mich., to cost about \$225,000 with equipment. Company has authorized sale of new stock issue to total \$9,500,000, a part of fund to be used for extensions and improvements, including transmission line construction.

Marmon-Detroit Co., 2927 Woodward Avenue, Detroit, local representative for Marmon automobile, has plans for three-story service, repair and garage building, 100 x 175 ft., to cost more than \$200,000 with equipment.

Board of Education, Owosso, Mich., plans installation of manual training equipment in new two-story high school, for which bids will be asked at once on general contract. William B. Ittner, 911 Locust Street, St. Louis, is architect.

Oldberg Mfg. Co., 2661 East Grand Boulevard, Detroit, manufacturer of automobile mufflers, etc., has awarded general contract to E. A. Moldenhauer, 18442 Muirland Avenue, for one-story addition, to cost about \$30,000 with equipment. Christian W. Brandt, 2111 Woodward Avenue, is architect.

Reo Motor Car Co., Lansing, Mich., has started foundations for new three-story unit, 140 x 700 ft., for manufacture of motor buses, including parts, to cost about \$400,000 with machinery.

Joseph N. Smith Co., 5914 Federal Avenue, Detroit, manufacturer of automobile hardware, has asked bids on general contract for a two-story plant unit, 150 x 800 ft., to cost over \$200,000 with equipment. Smith, Hinchman & Grylls, Marquette Building, are architects and engineers.

Chicago & North Western Railway Co., 226 West Jackson Boulevard, Chicago, is said to be planning new engine house, with machine shop and other units, at Iron River, Mich., to cost about \$150,000 with equipment.

Nicholl Chromium Co., Inc., 3704 Mack Avenue, Detroit, has been organized to operate under patents of United Chromium Corporation in chromium plating tools, dies, bearings, etc. Company is doing both job and contract work.

Indiana

INDIANAPOLIS, Oct. 1.—Plans are being considered by Alexandria Metal Products Co., Alexandria, for one-story addition, to cost about \$25,000 with equipment.

Wheeler-Schebler Carburetor Co., Inc., 1302 Barth Avenue, Indianapolis, has asked bids on general contract for three one-story additions, to cost about \$65,000 with equipment. D. A. Bohlen & Son, Majestic Building, are architects.

Board of Education, Sheridan, is said to be planning installation of manual training equipment in new two-story and basement high and grade school to cost \$185,000, for which bids have been asked on general contract. McGuire & Shook, 941 North Meridian Street, Indianapolis, are architects.

Showers Brothers Co., Bloomington, manufacturer of kitchen cabinets and other furniture, is reported to be planning one-story addition, to cost more than \$50,000 with equipment.

C. R. Wermuth, 1036 St. Marys Street, Fort Wayne, has plans for a new one-story machine shop, 75 x 108 ft. Pohlmeier & Pohlmeier, Central Building, are architects.

Emge Packing Co., Fort Branch, near Evansville, contemplates installation of conveying equipment and other handling apparatus in connection with an extension and improvement program to cost about \$100,000.

City Council, Muncie, will install electrically-operated pumping machinery and other equipment in a sewage disposal plant to cost \$1,000,000. Pearce, Greeley & Hansen, 6 North Michigan Avenue, Chicago, are consulting engineers.

Gulf States

BIRMINGHAM, Oct. 1.—Officials of Atlas Portland Cement Co., 25 Broadway, New York, have organized a subsidiary, Atlas Portland Cement Co. of Texas, Inc., capitalized at \$2,000,000, with headquarters at Waco, Tex., where 500 acres has been secured for new mill. Plans for initial units will soon be drawn, to cost more than \$1,000,000 with machinery.

Forest E. Gilmore Co., Wright Building, Tulsa, Okla., is said to have plans for new gasoline refinery near Pampa, Gray County, Tex., to cost about \$200,000 with equipment.

Drennen Motor Car Co., Ensley, Ala., has plans for a new service, repair and garage building, 150 x 150 ft., to cost about \$140,000 with equipment.

Cities Service Gas Co., 60 Wall Street, New York, operating natural gas properties, is said to be planning construction of new gas compressor station at Higgins, Tex., to cost about \$100,000 with equipment.

City Council, Bartlett, Tex., is reported planning installation of municipal electric light and power plant, to cost over \$40,000 with equipment.

Farmers' Gin Co., Georgetown, Tex., is planning new cottonseed oil mill near Wharton, Tex., to cost about \$75,000 with

equipment. Machinery will be electrically operated.

Southern Sugar Co., Clewiston, Fla., is completing plans for new mill in Canal Point, Fla., district, with initial output of 2500 tons per day. Project will include power house, machine shop and other buildings, and will cost about \$1,000,000 with equipment. Company is arranging sale of 35,000 shares of stock, no par value, part of fund to be used for new plant. B. G. Dahlberg, head of Celotex Co., 645 North Michigan Avenue, Chicago, is president.

Chevrolet Motor Co., West Grand Boulevard, Detroit, with main plant at Flint, Mich., is said to be planning new factory branch at El Paso, Tex., with repair and service departments, to cost \$110,000 with equipment.

Rubber Products Co. of Alabama, Inc., Muscle Shoals, Ala., has approved plans for a new mill to cost about \$100,000 with equipment.

Board of Education, Waco, Tex., has authorized installation of manual training equipment in additions to senior high school and to junior high school, for which bids will soon be asked on general contract, to cost over \$300,000. T. Brooks Pearson, First State Bank Building, is architect.

Officials of Monolith Portland Cement Co., Bartlett Building, Los Angeles, have plans for new mill near Port Aransas, Tex., to cost over \$1,500,000 with machinery. Company has organized a subsidiary, Monolith Gulf Portland Cement Co., to carry out project.

Board of Education, Petal, Miss., has plans for a one-story vocational school, to cost over \$45,000 with equipment.

Moore-Handley Hardware Co., 25 South Twentieth Street, Tuscaloosa, Ala., has plans for new multi-story storage and distributing plant, to cost over \$40,000 with equipment.

Cleveland

CLEVELAND, Oct. 1.—Machine tool sales increased the past week and inquiry for single machines is good. Business is coming largely from the automotive industry. Dealers' sales during September were in about the same volume as in the previous month. Demand for turret lathes, which fell off early in the month, took a new spurt the past week and September bookings were only slightly below August, which was an exceptionally good month.

Orders for two 30-in. geared head Niles lathes were placed during the week by Toledo Machine & Tool Co., Toledo. Firestone Steel Products Co., Akron, purchased a 3-in. radial drill, 12-in. lathe and a sensitive drilling machine. Akron Rubber Mold & Machine Co., Akron, bought a 6-in. vertical shaper.

Briggs Mfg. Co., Detroit, manufacturer of automobile bodies, has placed contracts for remodeling its Cleveland plant at Taft Avenue and East 131st Street and will again place this plant in operation. It has been shut down for three years.

Wasmer Bolt & Nut Co., Cleveland, has been organized to manufacture standard bolts and nuts and will begin operations about Jan. 1 in a new plant at 13109 Athens Avenue. Company has been incorporated with a capital stock of \$125,000. John C. Wasmer, secretary Cleveland Wrought Products Co., is president; M. J. O'Donnell, formerly president Falls Rubber Co. and O'Donnell Elevator Co.,

is vice-president and treasurer; W. G. Uhler is secretary.

Mullins Mfg. Co., Salem, Ohio, has plans for enlarged capacity to permit a 50 per cent increase in production. An addition will be provided and 10 new double action presses will be installed.

Contract has been let by Cleveland Wire Spring Co., 1281 East Thirty-eighth Street, Cleveland, to Boldt Rapp, 5511 Euclid Avenue, for one-story addition, 120 x 125 ft., to cost about \$80,000. George S. Rider Co., Century Building, is architect and engineer.

Easy-On-Cap Co., Cleveland, subsidiary of Eaton Axle & Spring Co., East 149th Street, has work under way on an addition to cost about \$100,000 with equipment.

Maumee Valley Rubber Co., Maumee, Ohio, has authorized plans for one-story addition to cost about \$25,000, and will install a 180-ton capacity press, trimming machines, boiler equipment, pumps, etc.

Western Reserve Mfg. Co., 3710 East Ninety-third Street, Cleveland, manufacturer of machinery and parts, has filed plans for one-story addition, 35 x 110 ft., to cost about \$45,000 with equipment.

Winston Motor Co., Inc., Twentieth Street and Madison Avenue, Toledo, Ohio, local representative for Graham-Paige automobile, will soon take bids for three-story service, repair and sales building, 55 x 100 ft., to cost about \$100,000 with equipment. Sidney Aftel, 1514 Madison Street, is architect.

Board of Education, Sixth and Rockwell Streets, Cleveland, will soon take bids for one-story vocational foundry, to cost about \$40,000 with equipment.

Alliance Toy & Specialty Co., Alliance, Ohio, has changed name to Alliance Mfg. Co., and has added to its Doo-Klip line a pruner and fertilizer sprayer, and made improvements to grass shears.

Pacific Coast

SAN FRANCISCO, Sept. 27.—Plans are being drawn by Northwestern Pacific Railroad Co., 64 Pine Street, San Francisco, for new one-story car and locomotive repair shop at Tiburon, Cal., to cost about \$45,000 with equipment.

Alloy Steel & Metal Co., 1862 East Fifty-fifth Street, Los Angeles, has filed plans for one-story machine shop, 65 x 84 ft., to cost about \$19,000 with equipment.

Standard Pipe & Supply Co., Los Angeles, is having plans drawn for a one-story storage and distributing plant, 53 x 240 ft., with pipe cutting, threading and other departments. A 200-ft. crane runway will be installed. Unit is estimated to cost over \$90,000 with equipment. Arnold A. Weitzman, Hibernian Building, is architect.

Southern California Edison Co., Los Angeles, has plans for a new equipment storage and distributing plant at Porterville, Cal., to cost about \$40,000 with handling and other equipment.

Great Northern Railway Co., King Street Station, Seattle, is completing plans for a new engine house, machine shop, forge and blacksmith shop and tool shop, 116 x 450 ft., to cost about \$175,000 with equipment.

George L. Barnes, Everett, Wash., has plans for a one-story brass foundry at Centralia, Wash., to cost about \$18,000 with equipment.

American Ice & Cold Storage Co., foot of California Street, Everett, Wash., is

contemplating three-story addition for ice-manufacturing and cold storage units, to cost about \$100,000 with equipment.

Fisher Body Corporation, General Motors Building, Detroit, is said to have plans for new one and two-story plant at Emeryville, Cal., to cost about \$200,000 with equipment.

Public Utilities Commission, Tacoma, Wash., Ira S. Davisson, chairman, is planning early call for bids for second unit of Cushman municipal hydroelectric power development, including water tunnel, dam, generating station and equipment, transmission lines, switching stations, etc., for which appropriation of \$3,850,000 has been authorized by city council.

Canada

TORONTO, Oct. 1.—Demand for machine tools in this market is holding close to the average of the past few weeks; inquiries indicate that business for the fourth quarter will exceed that of the past three months. September sales showed improvement over those in July or August and are expected to compare favorably with any month this year. The majority of manufacturing plants are operating at better than 75 per cent of capacity. Second hand and rebuilt tools are moving more freely.

Gray Ball Bearing Co., 686 St. Clarens Avenue, Toronto, has purchased one and one-half acres at Lansdowne and Royce Avenues and will start work soon on erection of a plant to manufacture automobile parts. Operations are expected to begin before end of year.

John S. Allen, Horning's Mills, Ont., is in market for a pony planer, 16 or 20 in. x 6 in. capacity; also a 28 or 32 in. band saw.

Bids have been called by B. H. & F. Prack, architect, 606 Lister Building, Hamilton, Ont., for a one-story factory, 123 x 146 ft., on Pelham Avenue, Toronto, to cost \$20,000, for W. D. Beath & Sons, Ltd., 394 Symington Avenue, Toronto, manufacturer of electric hoists, barn door tracks, steel drums, etc.

Plans for a four-story factory, 60 x 260 ft., at Toronto, for Willys-Overland, Ltd., are being revised by M. J. Streiffert, engineer, and new tenders will be called.

Hiram Walker Metal Products, Ltd., Kildare Road, Walkerville, Ont., contemplates building three additions to its plant.

F. Brown, 85 Raleigh Street, Chatham, Ont., has been awarded contract for an addition, 60 x 75 ft., to plant of Dowsley Spring & Axle Co., 81 St. George Street.

G. H. Thomas & Sons, Ltd., Dickson Street, Galt, Ont., has been awarded contract for one-story addition, 60 x 98 ft., to plant of Dominion Tack & Nail Co., Ltd., to cost \$20,000. John Evans, Water Street, is architect.

Ferguson Contracting Co., Ltd., Confederation Life Building, Toronto, has been awarded contract for erection of a building at Peterborough, Ont., for Canadian General Electric Co., head office, Toronto. It will be one story, 110 x 428 ft., and will cost \$150,000.

A number of sub-contracts have been awarded for erection of a machine shop at Toronto for Link-Belt, Ltd. Jackson-Lewis Co., Ltd., 1114 Federal Building, is general contractor.

Sub-trades have been let for a \$350,000 plant to be erected at Mount Dennis, Ont., for Firstbrook Boxes, Ltd., 283 King Street East, Toronto. James W. Wickett Co., Ltd., 16 Saulter Street, Toronto, is general contractor.

Canadian Tube & Steel Products, Ltd., 107 Hamilton Street, Ville Emard, Que., has awarded contract for addition to its plant to Reid Brothers, 511 St. Catharine Street West, Montreal.

Dominion Bridge Co. has purchased plant of McGregor-McIntyre Structural Steel, Ltd., Toronto, one of leading structural steel concerns in Canada. Dominion Bridge Co. is building an addition to its old Toronto works and purposes to operate both plants without change.

Western Canada

Canadian Utilities, Ltd., Calgary, Alta., will build a power plant at Nokomis, Sask., and has awarded general contract to R. H. Preiss, Nokomis.

Dominion Electric Co., Shaunavon, Sask., is arranging for erection of an electric light plant at Eastend, Sask.

Town Council, Melville, Sask., contemplates installing new sewage plant, with pumps and other equipment, to cost \$71,000.

Foreign

PLANs are being arranged by Pan-American Petroleum & Transport Co., 120 Broadway, New York, for new oil refinery on Island of Aruba, ex-Danish West Indies, to handle output of crude oil from local properties of its subsidiary, Lago Oil & Transport Co. Project will also include a gasoline refinery with eight cracking units, and 60,000-bbl. capacity skimming plant. Program is estimated to cost about \$10,000,000. Company has begun construction of new refining plant on 60-acre tract on South Elbe River, Harburg, Germany, to cost about \$2,000,000, and expects to complete this unit next spring.

Rhine-Westphalia Electric Power Corporation, Dusseldorf, Germany, known as Rheinisch-Westfälisches Elektrizitätswerk Aktien-Gesellschaft, is disposing of a bond issue of \$20,000,000, in United States, a portion of proceeds to be used for expansion in power plants and transmission systems in Ruhr district.

A company at London, England, operating mining properties at Rhodesia, British South Africa, is planning extensions in plant and installation of mining and operating machinery, with new central power plant, to cost close to \$1,000,000. Information at office of Bureau of Foreign and Domestic Commerce, reference England No. 73207.

Stockholms Superfosfatfabriks Aktiebolag, Stockholm, Sweden, is planning for expansion in its new nitrogen plant at Ljungaværk, to increase output of ammonium sulphate from 4000 to about 8000 tons per annum.

Central Paper Trust of Soviet Russian Government, Petrograd, is planning early purchase of machinery in United States for new Balakhna paper mill on Volga River, to an amount of about \$500,000. G. G. Khramtsoff, chief engineer, and E. A. Kayatz, consulting engineer, have arrived in America for this purpose and will make headquarters at offices of Amtorg Trading Corporation, 165 Broadway, New York, official buying agency for Soviet Government.

THE IRON AGE

New York, October 11, 1928

ESTABLISHED 1855

VOL. 122, No. 15

Profits From Apprentice Training

General Electric Official Reckons Cost of Educating the Individual Is \$3,000 but Expense Is Recovered When He Takes Supervisory Job

AN INTERVIEW WITH JOHN W. UPP

ON a 28-acre plot in West Philadelphia, the General Electric Co. is concentrating all design and manufacture of "switchgear." Switchgear not only includes station switchboards, but air and oil circuit breakers (from the small ones used to guard a single machine to huge outdoor installations to handle thousands of horsepower) and switches and switching stations for every kind of service and capacity. About 4000 men are now employed, a figure which will be considerably augmented when the auxiliary operations now conducted at other points are transferred to the new organization.

A visitor at this plant is struck by the many well-conceived plans for the comfort and health of the employees, and the orderly production of a wide variety of equipment with a minimum of waste motion and delay, much of which is "special" in that only a few will be made. Personnel matters have been given prime consideration. In no department is this feature better exemplified than in the apprentice school.

Here in a wing of one of the main manufacturing units are assembled 50 of the most modern machine tools, hardly two of them alike, yet each a representative of those installed in the main shops and each properly selected to perform one or more items of regular production. An adequate and shipshape tool room is also installed. Along-

side are four well-lighted and comfortable class and drafting rooms, and a couple of offices for the supervisors, teachers and clerical help.

Here machinist apprentices turn out parts requisitioned by the stock room, destined for switchgear under construction. Obviously such extensive and high-grade equipment means one thing—that the management is sincerely interested in apprentice training. And it was therefore found that the manager of the Switchgear Department, John W. Upp, was willing to talk rather freely about the expected returns from this educational effort.

Question: How long has the department been in operation?

Mr. Upp: "As you can see,

JOHN W. UPP has managed the switchboard department of General Electric Co. for more than 25 years. He was born in Sandusky, Ohio, in 1868 and graduated from Cornell University in 1889 as a mechanical engineer. He is now in charge of all matters pertaining to "switchgear" and manager of the rapidly expanding Philadelphia plant of the General Electric Co.

all our buildings and equipment are relatively new. The apprenticeship system at the Philadelphia works started in August, 1926, with three apprentices. It was recruited steadily until now we have 60 in the machinist course and 20 in the drafting course."

Q. Have you set a limit on the number?

Mr. Upp: "Yes; experience with similar schools in five other plants, dating back nearly 30 years, indicates that we cannot place more than 12 to 15 apprentices among each 100 journeymen without unduly interfering with the regular production."

First Lessons on a Turret Lathe

Q. How do you recruit the students?

"It has been necessary to do more or less advertising among our employees, by word of mouth and through the plant paper. O. H. Ginn, the head of the department, has also visited high schools in and near Philadelphia, explaining the opportunities we offer. Experience in other places shows that before long the apprentice system advertises itself, and an adequate number of desirable candidates continually present themselves.

"Qualifications? A prospective student must first of all convince us that he is serious-minded, and not merely looking for a job. He must pass a physical examination and be acceptable to the employment department. He must have a complete grammar school education. High school graduates are given one year's credit—that is, they complete the course in three years instead of four. The youngster is accepted on probation, as it were, for a couple of

months. If he then appears to have the right stuff in him a regular form of indenture (we call it an "apprentice agreement") is signed by the student, his parent or guardian, and by me representing the General Electric Co."

Q. Is the work scheduled in definite school terms?

Mr. Upp: "Not in the sense that school opens on a certain date and closes for vacation on another. An acceptable student may enter any time there is a vacancy. His work will be adjusted to his individual capacity, and his standing in the various classes determined by the instructors in short order. Since instruction is done to relatively small squads, the new student can readily be attached to a group which is at approximately his educational level. As you can see by the schedule of studies, the class room work is fairly extensive."

How about the shop training?

"All apprentices are looked upon as regular employees of the General Electric Co., and conform to the regular working hours. Nor are they permitted to absent themselves without previously being excused. Usually a tendency toward chronic tardiness is corrected by assigning the delinquent to a few days' 'fatigue duty,' that is, cleaning and janitor work around the apprentice department. With the exception of the class room work, which takes up an hour and a quarter daily, he is working in the shop. The machinist apprentice spends from one to two years at machines in the training department. At first he is helper to an advanced student, but soon he gets on regular production, of course under the watchful eye of a supervisor. After he has mastered the various tools he works a year in the manufacturing departments, and the last year in the tool, die or machine department in which he wishes to specialize. Such work increases his speed, rounds out his experience, and introduces him to the real shop atmosphere."

It seems to me that it would be rather hard on fine machine tools to have them operated by amateurs.

"On the contrary, cost records show that maintenance in the apprentice department is slightly lower than for the same machines in the produc-

tion line. This is probably due to the close supervision given to the students, and also to the much more deliberate pace of the operations. You should also remember that no 'practice' or 'exercise' work is done—all of it is destined for use. For instance, here is a short shaft with three keyways. Width of the keyways have a tolerance of plus or minus 0.0005 in. Angle must be correct to within 1/10 deg. A first year man made 106 of them with only 5 rejects. His speed was a little less than 45 min. each."

It seems peculiar that you are not able to get an ample supply of draftsmen, ready trained, from the young engineers graduating in electrical engineering.

"There is not such a surplus of these as you might imagine. When we get them we find they know a few things about many branches of electricity. What we want for a draftsman, and we find we have to teach him ourselves, is an intelligent man who knows a large number of

things about switchgear—just one important phase of electrical engineering. A high school graduate studying the drafting course first spends six months in the tracing department, learning drawing office routine. Then he spends six months in the apprentice department, becoming acquainted with the machine tools. Then he goes to the welding shop. For a year he progresses through the various assembly departments to become familiar with the different small parts of apparatus. The final period is in the drawing room. By this means we are able to show the student draftsmen the capabilities and the limitations of the various fabricating processes, so they will later avoid designing a part or an assembly which will be unnecessarily difficult or costly to make and erect.”

All this is lovely for the student, but a casual visitor would guess that you are spending a lot of money on each man, with no assurance he will return it to you.

“An actual balance sheet would be difficult to strike, because there are many intangibles which cannot be evaluated. Instinctively I would say that there *must* be money in it. Experience in other G. E. plants proves that apprentice training is the first step in a continuing progress toward sub-foremen, foremen and departmental managers.

In this way the course helps solve one of the very biggest managerial problems—‘Where can I get upstanding foremen?’

“But let’s make some Yankee guesses on the matter. Take a grade school boy. He enters at 22½c. an hour, and steps up 2½c. every six months, graduating four years later at 40c. For a good record he gets a 2c. an hour bonus, and a \$100 prize on graduation. Now assume that the value on the boy’s production ranges from 10 per cent of his wages up to 75 per cent at graduation (which certainly is conservative) and the balance sheet stands as follows:

	Wages	Value of Production
First year.....	\$556	\$55
Second year.....	673	168
Third year.....	790	395
Fourth year.....	907	672
Total	\$2,926	\$1,290

That makes a net cost of \$1,636, or with 100 per cent overhead \$3,272. Experience shows us that 65 per cent of our graduates become permanent employees, so counting for defections it means that each graduate may cost us as much as \$4,000. So much for the debit side.

“What about the credits? Mostly intangibles. But we

**Typical Scenes
in Class Room
and, at Top of
Page, in the
Machine Shop**

may evaluate the *permanency* of the employee (even if he never rises above a mechanic's grade) by assuming that one permanent employee is equivalent to six turnovers. It must cost at least \$200 to find, hire and get a new man into decent production. That cuts the debit down to \$2,800 immediately. That figure would be wiped out immediately when the man enters the supervisory grades. To my mind, a plant manager would regard himself lucky if he could acquire an adequate number of foremen, each of whose loyalty and capabilities were well known, for \$3,000 apiece!"

Classroom Schedule

For Four-Year Machinist

- 1st and 2nd Term—Arithmetic, algebra, mechanical drawing, English and practical talks.
- 3rd Term—Mensuration, geometry, mechanical drawing, English and practical talks.
- 4th Term—Plane trigonometry, mechanical drawing and industrial history.

- 5th Term—Elements of mechanics, free-hand and mechanical drawing, industrial history.
- 6th Term—Principles of mechanisms and mechanical drawing.
- 7th Term—Strength of materials, tool design and metallurgy.
- 8th Term—Types of prime movers, tool design and metallurgy.
- 9th Term—General physics, tool design and shop economics.

For Three-Year Drafting

- 1st Term—Advanced algebra, mechanical drawing and metallurgy.
- 2nd Term—Plane trigonometry, slide rule, and mechanical drawing.
- 3rd Term—Elementary electricity, descriptive geometry, and shop economics.
- 4th Term—Elementary analysis, tool design and business English.
- 5th Term—Advanced direct current electricity and mechanics.
- 6th Term—Strength of materials and advanced alternating current electricity.
- 7th Term—Thermodynamics and mechanisms.
- 8th Term—Machine and electrical design.

Profits Accrue from Volume at Expense of Margin Per Sale, Says Conference Board

VOLUME, rather than the margin per individual sale, is the road to profits in competitive industry and trade. In fact, narrow profit margins per sales dollar have come to stay, because they are an inevitable characteristic of the trend toward large-scale enterprise and mass production.

This is the conclusion of the National Industrial Conference Board, New York, after analyzing the ratio of profits to sales and investment for more than 4000 large and successful industrial and mercantile corporations. The investigation, which was part of a study undertaken to determine the possibility of shifting the corporation income tax to the consumer, covered the post-war years 1918 to 1925.

Sales at prices closely approximating cost of production, the Conference Board analysis discloses, are the dominant factor in determining commodity prices, forcing producers and merchants to seek profit by volume rather than profit by individual sale. Approximately half the sales of the large and successful corporations selected for analysis annually yielded less than 5 per cent profit in most of the manufacturing industries; in trade, particularly the wholesale trade, more than half of the sales were made at a profit of less than 5 per cent or at a loss. The average amount of sales at low profit rates or at a loss for all corporations is estimated to be even greater.

This condition, however, does not necessarily result in a low return on capital invested, but rather tends to accelerate turnover of capital and thus may result in high returns, the Conference Board points out. Corporations operating at the lowest ratio of profits on sales were found to have ordinarily the highest turnover of capital and often, therefore, are among those enjoying the highest return on capital.

The exact proportionate amount of the total business of all corporations transacted at a loss cannot be determined with the data now available. Almost every corporation, however, makes a portion of its sales at a loss, even though a net profit is realized on the grand total.

Although the corporations whose transactions were studied by the Conference Board include almost all of the large successful corporations in the country, every year during the period considered the total operations of some of them resulted in a loss; on an average corporations operating at a loss handled about 5 per cent of the total sales of all of the companies under scrutiny. When all manufacturing corporations in the country are considered as one group, it is found that those operating at a loss transacted about 13 per cent of the business; trading corporations operating at a loss transacted about 18 per cent of the total business of that class of companies.

High-Temperature Resistance Alloys

RESearch data on high-temperature resistance alloys were presented at the fall meeting of the (British) Institute of Metals in Liverpool, England, Sept. 5 and 6, in a paper, "Laboratory Experiments on High-Temperature Resistance Alloys," by C. J. Smithells, S. V. Williams and J. W. Avery, offered as a communication from the staff of the research laboratories of the General Electric Co., Ltd., Wembley, England. Briefly the authors presented the following results:

A series of nickel-chromium alloys containing from 10 to 60 per cent of chromium, and a few ternary alloys containing tungsten and molybdenum, have been made from specially pure materials melted in hydrogen. They have been subjected, together with some commercial nickel-chromium alloys, to new forms of test for resistance to oxidation and to sag, at high temperatures. For the binary alloys resistance to oxidation increases with increase in chromium content up to 30 per cent. With more than 40

per cent a second phase appears, and resistance to oxidation falls. Ternary alloys containing only 10 per cent of chromium show low resistance, while those containing 20 per cent of chromium show high resistance to oxidation. The composition of the oxides formed on the alloys has been determined by X-ray analysis. For high resistance to oxidation the oxide layer must contain at least 50 per cent of chromic oxide. The composition of the oxide layer is determined by, but is not generally the same as, the composition of the alloy.

For the binary alloys resistance to sag at high temperatures decreases with increase in chromium content. The ternary alloys sag more than the binary alloys having a similar nickel content. Small amounts of impurities have a marked effect in lowering both the resistance to oxidation and to sag. The electrical resistivity of all the alloys has been determined between 20 and 1000 deg. C.

Atomic Hydrogen Welding In Production

Gas-Tight Seams for Refrigerators and
Indicating Instruments—Strong Joints
on Automobile Parts—Repairs to Dies

BY P. C. GREENE*

ATOMIC hydrogen welding utilizes the electric arc with a stream of hydrogen gas. Power is single-phase, 60-cycle alternating current and an arc is maintained between tungsten electrodes. The hydrogen serves a three-fold purpose: first, it prevents electrode oxidation; second, it forms a highly reducing atmosphere over the work, preventing the formation of oxides and nitrides in the weld metal; third, it changes to the atomic state in passing through the arc, and recombines to the molecular state at the surface of the weld metal, thus acting as a powerful heat carrier and generator.

It must be borne in mind that the arc does not touch the work and that the work is not part of the circuit. The weld in reality is made by a flame of atomic hydrogen at approximately 4000 deg. C. This ideal combination of high temperature with reducing atmosphere gives unusually strong ductile welds at a rapid rate, free from oxides and blow holes and with a smooth finished appearance.

The development of this new welding process has been so recent that its field is not yet mapped out. In the factory it is proving a formidable process, not alone on a quality basis, but on cost of operation as well.

Smooth Welds Require Little Finishing

Several interesting applications may be noted. First, perhaps, is the welding of the cover and icing unit of the General Electric refrigerator. The cover is formed of sheet steel and the projections on the under side are folded toward the center, thus requiring a welded joint extending from each corner diagonally toward the center. These welds are made by the atomic hydrogen process, not because of the strength and soundness of the joint produced, but primarily because of its extreme smoothness, requiring a minimum amount of grinding and finishing to produce a level surface. The saving in finishing more than offsets the lower initial cost of metallic electrode arc welding which was originally used.

The icing unit of the refrigerator is a second illustration. This unit is roughly rectangular in form and consists of three sheet-steel shells nested and edge welded at a common seam. The combined thickness of metal is about 7/32 in. and the perimeter about 32½ in. Finest quality welds are made on this work at the rate of 6½ to 7 in. per min., and little if any grinding or finishing is required before vitreous enameling. No imperfections in the enamel finish are caused by these welds.

Another valuable application is building up worn dies

and molds; an hour of welding will often salvage a very expensive unit. Much extra machining and finishing is required, especially on small work, when a process is used that makes it difficult to control closely the amount of metal deposited. In the hands of a skilled operator the atomic hydrogen process gives a smooth surface, with equally good control as to location and amount of the deposit and seldom blisters or scales the adjacent polished surfaces.

As an example, two steel engraver's plates were welded; the original high polish remained unharmed at all points along a 5-in. seam up to within 1/16 in. of the weld where the metal had been in a molten condition. For this reason the Schenectady factory of the General Electric Co. is utilizing this process daily in salvaging dies and molds, and at least one other manufacturer is doing similar work. Stel-

Weld Just Completed in Minor Refrigerator Part Held in Fixture. Gas jet controlled by trigger on handle; electrical current by push button on bench

*Industrial Heating and Welding Engineering Department, General Electric Co., Schenectady, N. Y.

liting of die surfaces has also been done very successfully.

Torque tubes for automobiles have also been made by the new process. This tube is $\frac{1}{8}$ in. wall thickness, 2 in. outside diameter, made of S. A. E. 1035 steel. Into each end is fitted a splined steel shaft with a shoulder flush outside. A flush butt weld is made between this

Medium Steel Tube, $\frac{1}{8}$ In. Wall, Fails in Torsion Before Weld Shows Distress

shoulder and the tube in 40 sec. Under test such tubes fail under torsion without affecting the weld. Because of the speed, appearance and strength, atomic hydrogen welding was adopted in preference to carbon arc welding.

Pipe Systems Welded Under Pressure

A unique application exists in a factory making indicating and recording instruments where quality, neat ap-

pearance and strength are paramount. First, the hollow alloy steel spiral which actuates the indicating needle is welded to one end of a steel capillary tube and the other end to the bulb containing the actuating liquid or gas. The sensitive system is then filled under pressure, and the entrance plugged rapidly by the atomic hydrogen process. In this operation a tight weld must be made, as an infinitesimal leak would throw the instrument out of calibration in a period of time or render it useless. The weld must also be completed before the heat flow from the welding zone is conducted to the liquid in the system, which would cause enough internal pressure to force the liquid out through the molten or cooling weld metal. Other welding processes failed either because of porosity or time consumed. Since pressures in gas-filled instruments may reach 1800 lb. per sq. in., and 3000 lb. per sq. in. in mercury-filled types, it is readily seen that a perfect weld is required.

In this same service, alloy bulbs of nichromes are welded to steel capillary tubes, and nichrome plugs are welded in the bulbs. The smoothness of this high-speed weld on steel bulbs is remarkable—no filing or finishing is required.

Sheet aluminum, searchlight drums and the vacuum-tight welds on mercury arc rectifiers, the fabrication of monel metal tanks and the sheet steel tanks for small oil switches are other applications.

Doctor Hatfield Discusses Corrosion and Acid-Resisting Steels

SPEAKING in Providence, R. I., at a joint meeting of the Providence Engineering Society and the Providence Chapter of the American Society for Steel Treating, on Wednesday evening, Oct. 3, Dr. W. H. Hatfield of Sheffield, England, presented the section of his forthcoming Campbell memorial lecture, dealing with corrosion and acid-resisting steels, giving a summary of the experimental work done in his own and other laboratories.

Doctor Hatfield believes that "ordinary iron is intrinsically rust resisting" and links the passivity of iron caused by immersion in nitric acid, and the film of oxide isolated by Ulick Evans, with resistance caused by the addition of chromium. When chromium is added in sufficient quantity it forms a passive film, protecting the metal.

Stainless steel is stainless because of this passive protective film. While the addition of nickel alone to steel effects no improvement of the metal's resistance to nitric acid, the addition of 14 per cent of chromium to iron makes the metal as resistant to nitric acid as pure nickel. When nickel and chromium are both added to iron, the passive film is of a different character from that produced by chromium alone, and in many cases does actually resist acids.

Although a great deal of data on corrosion-resisting steels are available, it is difficult to answer any specific question of industrial application with a definite yes or no, until the factors of composition, concentration of acids, conditions and temperature have all been considered.

Doctor Hatfield distinguishes three classes of corrosion and acid resisting chromium steels—stainless steels, stainless irons and chromium-nickel or austenitic steels. Of the first two, more attention has been paid in Europe to the stainless steel group, in the United States to the stainless irons. Applications of the stainless alloys have been made in Europe to automobile parts, chemical equipment, ornamental iron, and engineering uses such as dock sluice gates.

On tests of atmospheric corrosion the order of increasing resistance to corrosion is (1) mild steel, (2) chromium steel, (3) chromium-nickel steel; likewise the austenitic and chromium-nickel steel are resistant to steam at high temperatures.

For engineering purposes, where, in addition to non-scaling properties, high tensile strength is required at elevated temperatures, the addition of silicon and tungsten to the chromium-nickel steels has proved effective.

Influence of Manganese in Steel Welding Rods

EXCESS of manganese in welding rods used on high-speed work, where the operator has little opportunity to puddle his metal, is apt to cause blow-holes similar to those caused by carbon. For this reason, and particularly for production welding on thin steel sheets, a rod low in manganese should be used. Considerable information on this subject is given in Bulletin 129 of the Fuzon Welding Corporation, 103rd Street and Torrence Avenue, Chicago. Physical properties of the weld seem to be improved in toughness by increasing manganese up to about 1 per cent. Above that ratio and up to 9 per cent manganese it hardens and makes the steel brittle. For some applications where brittleness is of little consequence the hardness thus produced is desirable.

With rods above 9 per cent in manganese, together with carbon over 1 per cent, the metal is said to be made very soft by quenching from a comparatively high temperature in water. On the other hand, if cooled slowly it is hard, and it hardens easily with cold work. On this account it offers great resistance to wear. All welds made with it are apt to check-crack unless proper rods and technique are used. This metal is non-magnetic and the properties are found most pronounced at between 12 and 14 per cent manganese and 1.25 to 1.50 per cent carbon.

In metallic arc welding, manganese in the welding rod affects its operating characteristics. While carbon speeds up the rate of melting, manganese either does not speed it so much or possibly even slows it. This is believed due to the fact that manganese oxide is not a gas except at extremely high temperatures. Hence, its formation does not produce a violent commotion, as with carbon, in throwing over the molten drops from the electrode end.

Forge Shop of Unusual Flexibility

Arrangement Permits Ease of Materials Handling
and Short Travel for Work—Products
Are of Many Materials

BY FRED L. PRENTISS*

ARRANGED for convenience in material handling, economy in operation and what are regarded as the most modern practices in layout, a new commercial drop forging plant recently was placed in operation by the Steel Improvement & Forge Co., Cleveland. Formerly confining its product largely to automobile forgings, the company has expanded into other fields and its growth necessitated the erection of a plant of larger capacity, which was built on a new site. It is now manufacturing all kinds of industrial forgings, as well as automobile and airplane forgings, and its products include forgings of stainless steel, monel metal and copper and brass.

*Resident editor at Cleveland for THE IRON AGE.

The forge shop and press room occupy parallel buildings, each 60 x 220 ft. Between these is a cooling yard, 40 x 200 ft. The heat-treating, inspection and shipping departments occupy space in the press room. The steel storage yard, 60 x 200 ft., and served by a 10-ton overhead traveling crane, is alongside the forge shop. A railroad siding extends along the outer side of the storage yard. Two electrically driven shears, with a capacity for cutting 4½-in. square 0.50 per cent carbon material, are located in a shear shed at the side of the stock yard, and adjoining the forge shop.

A die room, offices and laboratories are located in a 60 x 160-ft. building connected with the forge and press shops

LAYOUT of the Plant Conduces to Convenience in Handling Materials and Hence to Economy in Operation. The equipment includes 20 hammers and 21 presses

and running across their ends. This arrangement makes both shops accessible to the die department. Forging dies are stored under a balcony at the end of the forge shop and trimming dies in bins at the end of the press room.

Twenty Hammers in the Forge Shop

The forge shop is equipped with 15 board hammers ranging in size from a 6500-lb., four-roll hammer down to a 1200-lb. hammer, and five steam hammers ranging from 3000 to 1500 lb. The hammers are of the Erie, Chambersburg and Billings & Spencer makes. They are arranged in two straight lines down the shop and are grouped to obtain maximum production at a minimum cost. At the side of the 6500-lb. board hammer is a 3000-lb. steam hammer, and other units are so grouped that each steam hammer is alongside a larger board hammer.

Forgings are first blocked on a steam hammer and then

trolley in the shipping room loads the finished forgings on the trucks.

Leaving the hammers, most of the forgings are put into large metal boxes and go to the press room for trimming and heat treating. The large forgings, however, are usually hot-trimmed at the hammers. One of the presses is used for hot-forming and various special work, this unit being served by a separate furnace. A 1000-lb. steam hammer is located in the press room, to restrike forgings that require that operation after heat treating.

Automatic Control on Forging Furnaces

A feature of the forging furnaces is that some of them are connected with recording pyrometers and have individual automatic control equipment working through Geisinger valves. The control equipment has been placed near the office. Control of the heating furnaces is now being

A SECTION of the Die-Making Department. The die makers have individual benches along the wall, back of the row of die-sinking machines

finished on the adjoining board hammer. The forging furnaces that serve the larger units are back of the hammers, trolleys being provided for handling the work between hammers and furnaces. Furnaces are located also at the side of the smaller hammers, permitting one man to handle the work and minimizing steps.

Press room equipment includes 20 trimming presses of Bliss, Toledo and Cleveland makes and one 600-ton coining press, most of them being arranged in a straight line along one side of the room.

Both the hammers and presses are arranged so that there is ample space around the machines for handling work in process. Room is provided back of the presses for the installation of a conveyor system. Back of each hammer is a metal box 24 x 30 in. x 48 in. high, in which portable tool equipment and dowels for the hammer are kept under lock and key.

Handling of work in process and of dies and tools is done by lift-platform electric trucks. Stock is sheared to proper length, dropping into boxes, which are moved from machine to machine on trucks. These also carry the finished product from the shipping department to the car loading dock over a concrete driveway at the rear of the plant. A

conducted in an experimental way in connection with special forging work. This control equipment is being used with a view of holding the heat control of the furnace to closer limits.

The heating furnaces, oil-fired, which were built from the company's design, are of steel construction, with the top arches made in sections held together with cast iron clamps. Any arch can be removed if it burns out.

There are five natural gas fired heat-treating furnaces of the box type. They are connected with Wilson-Maeulen recording instruments and have indicating control for the operator. Quenching tanks are conveniently located at the floor level in front of the furnaces.

Steam is supplied from a Connelly 300-hp. water-tube boiler in a 37 x 48-ft. powerhouse located at the end of the stock yard. Coal dumped into a hopper at the end of the tracks is elevated into an overhead bin, the hopper and bin having capacity for one carload. The coal is fed by gravity to an automatic stoker supplied by the Combustion Engineering Co.

High-pressure steam is carried to the shop through an 8-in. high-pressure main that is stepped down to 3 in. at the last hammer. The steam pressure at the hammers is

***M**OST of the Presses in the Press Shop Are in a Row on One Side and the Heat Treating Furnaces on the Opposite Side. Liberal floor space is provided for trucking work*

about 125 lb. Exhaust steam from the hammers is carried through a low-pressure line (3 lb. to 5 lb.) and is used to heat the plant and offices, through a vacuum heating system. The plant heating equipment includes three forced-draft heating units supplied by the Skinner Brothers Mfg. Co. The exhaust steam line starts with a diameter of 12 in., but is reduced in size beyond the supply line for the heaters. Each heater has a 5-hp. motor, which operates a blower that circulates the warm air through the rooms. The blowers will be used in the summer for creating a circulation of air through the shops.

Fuel oil for the heating furnaces is stored in four under-

ground tanks with a combined capacity of 80,000 gal., and is pumped through a loop system of distributing lines by a Tate-Jones Co., Inc., system. The main oil line is 1½-in. pipe and the oil is fed to the burners through ½-in. pipe. One oil heater is located in the pump room and another one half-way through the system. The oil is kept at a temperature of 100 to 150 deg. Fahr. and a pressure of 30 to 35 lb. is maintained on the oil lines.

Much Air Is Used Under Pressure

Low-pressure air for the forge shop furnaces is supplied by two 5400-cu. ft. General Electric motor-driven pressure

***H**AMMERS in the Forge Shop Are Grouped, With a Steam Hammer Alongside of a Larger Board Hammer. A forging is first blocked on the former and then finished on the latter*

blowers, in the gallery at the end of the forge shop. The main switchboard for power and light is in this gallery also. Air is delivered at 1½-lb. pressure through a 20-in. welded steel pipe. Low-pressure air for the press room, including the heat-treating furnaces, is supplied at the same pressure by a 3600-cu. ft. General Electric pressure blower through a 12-in. line. Air at 100 lb. pressure for sand blasting is furnished by an Ingersoll-Rand 62-hp. compressor. This compressor also supplies air for operating the valves on the shears and on some of the newer types of presses that have air-operated clutches, thus eliminating foot treadles. All forgings are cleaned in a Pangborn sand-blast room.

The forge shop is of good height, being 26 ft. to the roof truss and 41 ft. to the peak, providing clearance for the installation of larger hammers than are used at present. The roof and such portions of the sides as are not glass inclosed are covered with Toncan metal. The lower section of the forge shop side walls and portions of the press room side walls have 10 x 20-ft. rolling steel doors, which are kept open in summer to aid in ventilation and trucking.

Mounted on the roof of the forge shop are nineteen 54-in. Swartwout ventilators with a capacity for changing the air every 3½ min. The forge and press shops have concrete floors. All machinery foundations are oversize, so that press machines can be replaced by larger and heavier units. There are light and power and compressed-air lines back of all hammers, permitting the use of portable tools and lights.

The die department is well lighted and each die sinker has an individual bench, the benches being located along the outer wall.

A well equipped chemical and physical metallurgical laboratory is maintained. All steel when received is given a pile number; samples are taken from each heat and analysis is made of the stock and recorded. This follows the work through the process, and affords an identification of the steel from the time it is received until the finished forging is shipped. The record is kept on file so that, long after a forging has gone into service, a check may be made of the analysis of the steel from which it was manufactured.

Corrosion in Metallic Protective Coatings

A STUDY has been made of the corrosion occurring at different kinds of discontinuities in coatings of non-ferrous metals on steel; the work has included sprayed coatings of copper, nickel and aluminum, and, in addition, coatings of zinc and zinc-iron alloy produced by hot-galvanizing, electrodeposition, spraying and sherardizing. Specimens of varying thicknesses of coating were subjected to six different types of corrosion. A report of this study was presented at the fall meeting of the (British) Institute of Metals at Liverpool, England, Sept. 5 and 6, in a paper by Ulick R. Evans of Cambridge, England.

The cracks produced by bending are more dangerous than uniformly distributed pores, says the author. If the coating metal is cathodic to steel, the steel is corroded. Copper under some conditions causes marked acceleration of the corrosion of steel at exposed places, while nickel is less dangerous in this regard. If the coating metal is anodic to

steel, the coating is likely to suffer corrosion, the steel thereby receiving protection; thus steel coated with zinc usually suffers no corrosion even at cracks until the zinc becomes exhausted.

Steel thickly covered with zinc usually fares better than thinly covered steel, notwithstanding the greater tendency to cracking. Old galvanized sheets carried more zinc than the modern material and generally lasted longer. Coatings of aluminum or zinc-iron alloys are themselves less attacked than coatings of free zinc, but for that very reason they afford less sacrificial protection to the underlying steel in certain waters.

Zinc itself is rather rapidly attacked when partially immersed in a chloride solution, but alternate salt-spraying and drying was found to build up a protective film—a fact which explains certain observations made on the behavior of galvanized iron in service.

Chromium Platers Subject to Nosebleed and Ulcerated Sores

COMPARATIVELY mild exposure to fumes arising from chromium plating baths is sufficient to cause nosebleed, ulcerated nasal passages and sores on the hands, according to governmental investigators.* Adequate ventilation and use of rubber gloves is recommended to prevent this industrial hazard.

The bath consists principally of chromic acid, and during the plating process considerable hydrogen and oxygen are liberated, and these carry a spray of chromic acid into the air. It has long been known that in the manufacture of chromic acid and chromates the operators are subject to perforation of the nasal septum and to formation of ulcers or "chrome holes" on exposed parts of the body.

To determine the extent of the hazard and the best means of overcoming it, several commercial plants were visited. It was found by Messrs. Bloomfield and Blum that exposure to very low concentrations of chromic acid—for example, one-sixtieth grain in 350 cu. ft. (which is about the volume of air breathed by a worker in eight hours)—is

sufficient to cause nosebleed and nasal inflammation in a week. Higher concentrations or longer exposures cause extensive attack and even complete perforation of the nasal septum. This is painless, however, and the operator may be entirely unaware of the perforation.

Many of the employees were found to have chromium ulcers on the hands or other exposed parts of the body. No evidence was found of injury to the respiratory tract except in the nose nor of any effect upon the digestive system or the kidneys.

Eliminating the Hazard

While there is a real hazard in chromium plating, it is not critical and can be entirely eliminated by suitable measures. These should include an effective system of ventilation in which the air is drawn horizontally across the plating tanks into a narrow duct in which the air velocity should be about 2000 ft. per min. So far as possible rubber gloves, aprons and shoes should be worn. Frequent applications of vaseline or mentholatum salve to the nose and hands greatly reduce the danger of ulceration. All cuts and abrasions of the skin should receive regular inspection and medical treatment.

*J. J. Bloomfield of the Public Health Service, and W. Blum of the Bureau of Standards, writing in the Sept. 7 issue of *Public Health Reports*, Government Printing Office, Washington.

Local Conveyors Yield Economies

Automatic Pace Setters in Cadillac Plant Reduce Stock in Departments and Allow Space for More Machines

BY FRED L. PRENTISS*

CONVEYOR lines for sub-assemblies and departmental conveyors for handling work in process from machine to machine have recently been installed in the plant of the Cadillac Motor Car Co., Detroit. For the assembly of rear and front axles power-driven conveyors have been provided, and work is moved through several of the manufacturing departments on overhead conveyors, for successive operations.

The extension of conveying equipment is effecting numerous economies in production. The assembly conveyors for axles act as automatic pace setters. They split up operations and permit carrying out progressive assembly to a fuller extent than was possible under old methods. The assembly conveyors have caused to be cast into the discard, in the departments in which they have been used, both the old type of floor stand and the dolly trucks mounted on casters, which took a great deal of floor space and failed to afford a solid mounting for the work during such operations as hammering. One advantage found in the use of the assembly conveyors is that the work during the assembling operations always has a solid support.

Much floor space is being saved by the departmental conveyors, thus providing room for additional lines of machines. This saving is effected by the elimination of trucks

and the avoidance of the piling of material-in-process at the side of the machines. The department conveyors are also pace setters. With their use material is kept moving. As there is no piling up of stock in process, the amount going through a department at any time is but a small percentage of the quantity formerly piled on the floor. Another economy that is by no means small is effected by having a much smaller amount of stock to keep track of.

Rotating Assembly Table or "Merry-Go-Round"

The rear-axle main-drive gear set is built up on a revolving circular conveyor known as a merry-go-round, 12 ft. in diameter, which moves at a speed of $2\frac{1}{2}$ ft. a minute. This has a moving outer section or assembly table. A circular platform within the circumference of the moving table, and at a slightly higher plane, serves as a stationary table and is provided with racks for holding small parts used in the assembling. The operations on the merry-go-round include assembling the main driving gear and the differential gears in a carrier or housing, all making a gear set. Seven working stations are provided around the merry-go-round for the successive operations. The housing is placed on a trunnion-type fixture. The studs are inserted and then the gear set is assembled in place. Shims are packed in, the nuts are tightened and the unit is inspected.

*Resident editor at Cleveland for THE IRON AGE.

A Revolving Table or Merry-Go-Round Is Provided for Assembling the Rear Axle Main Drive Sets, the Successive Operations Being Performed as the Table Revolves

Then a driver is applied for testing, and the unit is taken from the merry-go-round to an adjoining test booth. Separate merry-go-rounds are provided for Cadillac and LaSalle gear sets. There are similar merry-go-rounds for the transmission assembly.

Rear axle units are assembled progressively on a moving plate-type conveyor approximately 50 ft. long, on which are mounted cradle-type fixtures on 6-ft. centers. The rear axle housing is placed on the cradle, the brake mechanism is assembled, the gear set is attached and other parts are added, all operations being done while the conveyor is in continuous motion. Gear sets, after testing, are placed on a sliding rack at the side of the axle assembly conveyor, where they are within easy reach of the men employed on the axle assembly line.

The completed rear axle assembly is discharged from the conveyor to an inclined table. It slides down this to a point

the conveyor through a drying oven 110 ft. long, in which they stay 45 min. at a temperature of 325 deg. Fahr.

The axle conveyor, on leaving the oven, goes down an incline at the side of an inner court, carrying the axles from the third floor to a point near the chassis assembly line on the first floor. Here monorail hoists pick the axles off the conveyor, the front axle being carried directly to the assembly line. The rear axle undergoes one operation before reaching that line—putting on the torque tube.

Front axle steering knuckles are handled from operation to operation on an overhead endless chain conveyor 240 ft. long. There are over 20 machine operations on the knuckles. This conveyor completes a circuit of the department, one line passing over a row of machines and the other between two rows. Its installation, by eliminating old methods of handling work in shop boxes at the side of the machines and moving it from one to another in trucks, has provided

Front Axles Are Assembled on a Plate-Type Conveyor in Continuous Motion. A similar conveyor is used for assembling rear axles. The housing is held in a cradle-type fixture on this conveyor and the assembling is done while the conveyor is in continuous motion

where a carriage operated by an air cylinder delivers it to hooks of a carrier suspended on 8-ft. centers from an overhead endless chain conveyor. Each carrier has two pairs of hooks, one for the rear axle and the other for the front axle, so that a carrier can be used for either axle, although both axles are not placed on the carrier at one time.

Front axles are assembled on a plate conveyor 66 ft. long. The I-beam part of the axle is placed on a fixture, and the axle is built up while the conveyor is moving. The conveyor has variable-speed adjustment through a Reeves drive, the speed being determined by the number of axles to be made in a day. A checking fixture is suspended from a monorail above the conveyor.

Chain Conveyor Carries Axles to Chassis Line

Both front and rear axles, after assembling, are carried on the endless chain conveyor through a paint booth, where they are sprayed with a priming coat. They continue on

space for an additional row of machine tools. The work is suspended from the conveyor on hooks on 2-ft. centers. The only handling by truck in this department is in bringing the rough parts to the first machine.

Another departmental conveyor is in the axle shaft department. Here a conveyor 270 ft. long, similar to that used in the steering knuckle department, runs between the rows of machines and delivers the work for successive operations.

Connecting rods are handled from operation to operation by a two-way roller conveyor in front of the machines and behind the operators. These are stacked on wooden trays, 200 on a tray, and loaded trays can be stacked above each other. At about every 20 ft. in the roller conveyor there is a narrow opening, providing a passageway for the workmen. Formerly the connecting rods were carried from one operation to another on pipe racks. Now pipe racks are used only at the machines during the finishing operations and for

carrying the rods to the point of inspection and to the motor assembly department. When former handling methods were used the floor was badly littered up with work, and it was difficult to keep track of stock.

Making Room for More Machines

Camshafts are handled from operation to operation on an overhead endless chain conveyor 600 ft. long, built in two sections, these being separated near the center on account of a heat-treating operation. Formerly there was space in this department for only three lines of machines, but the conserving of space by the use of the conveyor has provided room for an additional line of machine tools. Formerly there were 3000 to 4000 camshafts on the floor or on trucks going through the various operations in this department. This number has been greatly reduced.

Another overhead conveyor is used for carrying crankshafts over a main traffic aisle, a distance of 300 ft. from

An Overhead Conveyor 240 Ft. Long Has Replaced Shop Boxes for Moving Steering Knuckles from Machine to Machine

the last rough-grinding operation to the point of the first finishing operation.

Designed by the plant layout division of the Cadillac tool engineering department, the conveyors described were built by Detroit conveyor builders.

Research Aids New England to Cut Manufacturing Costs

Compelled to meet strenuous competition in a prolonged buyer's market, New England manufacturers, deprived of the advantage that they formerly enjoyed through plentiful water-power, are turning in increasing numbers to research as a means of cutting costs and improving products. Machine tool companies, textile weaving organizations, shoe manufacturers, paper mills, small arms makers, paint manufacturers—all are taking advantage of applied research to simplify and standardize products and processes of manufacture, frequently with amazing economies.

A brief history of the accomplishments of 28 New England companies through this method is contained in a booklet, "Use of Research in Standardization and Simplification" published by the Policyholders Service Bureau of the Metropolitan Life Insurance Co., 1 Madison Avenue, New

A Two-Way Roller Conveyor Is Used to Move Trays of Connecting Rods Between Machines. The conveyor takes the place of pipe racks formerly used

York. The brochure contains a part of the compiled data on research in industry gathered during a comprehensive survey of New England industry. It is arranged in four sections, each representative of a particular method of attacking the combined problem of simplifying and standardizing manufacturing processes.

An Endless-Chain Overhead Conveyor 600 Ft. Long Carries Camshafts from One Operation to the Next. Enough space has been saved by the elimination of trucks formerly used in handling work from machine to machine in this department to make room for the installation of a fourth line of machines

"Ruthless Buying" Declared Unsound

George H. Charls, President National Association of Flat-Rolled Steel Manufacturers, Reminds Purchasing Agents That They Have a Part in the Prevention of Uneconomic Conditions

PURCHASING agents should set themselves against "ruthless buying" and the consequent price demoralization from which various branches of the steel industry have suffered. This thought was emphasized by George H. Charls, president National Association of Flat-Rolled Steel Manufacturers, in an address before the National Association of Purchasing Agents at its sixth district convention in Toledo, Ohio, on Oct. 2.

"It may be predicted," said Mr. Charls, "that the time will come when no reputable buyers will be guilty of the irrational policies pursued in some quarters today. The ablest buyers will be those who possess a true understanding of their responsibilities in buying, and in obtaining the best price for their companies they will have the wisdom to know that the lowest price may be the worst price—a menace to the prosperity of industry and a threat to the best interests of their own companies.

"The managing executive, responsible for a corporation's policy, who assumes it is right to bring all pressure to bear upon his purchasing department to secure the lowest price possible in mass buying, is doing business as it was done 3000 years ago. Such a policy is a derelict of the past. There is a new order of things—a modern understanding of economic law—a recognition of the fact that the prosperity of an industry depends upon the prosperity of the whole and that no man can live unto himself alone.

Calls Insistence on Unreasonably Low Prices "Profiteering"

"Any industry which is profiteering at the expense of and to the serious detriment of another primary industry by unscrupulously insisting upon unreasonably low prices will eventually reap what it has sown, in exactly the same manner as the seller who profiteered when conditions were reversed has always suffered his just punishment. The managing executive and the purchasing agent will no longer be excused for not recognizing in advance the economic effects of their acts.

"It has become an accepted principle in industry that stabilization in demand, production, wages and prices is to be preferred always to the wide and wild fluctuations from high peaks to deep valleys.

"It is also being accepted with the same certainty that the unsavory price cutter, with his secret rebates, confidential arrangements and ignorance of economic reactions, is a pernicious influence in any industry, to the buyer, the seller and the public alike—an unsafe, unsound opportunist with nothing to sell but a price. Such a seller does not know that he is overestimating the transient advantage of cut prices, that the secret rebate of today is the published price of tomorrow, that price cuts merely precipitate like cuts by all competitors and bring about a lowering of the net income of the industry without anyone being the gainer. Herein lies one of the reasons why prosperity does not stay with us always.

"Even those who profligately are taking advantage of the steel industry's dilemma must in all fairness commend the patience and fortitude with which it is sacrificing profits to avoid following the example of other industries which

have resorted to a cut in wages, with the natural consequence of reduced purchasing power of their employees. In this respect, at least, the steel industry is proving itself worthy of the leadership accredited to it."

Mr. Charls compared profits of the steel industry, at an average of 5.22 per cent in 1927, with those of the automobile industry, at 28 per cent, and the return for all capital in industry, estimated at 10 per cent. He predicted that the steel industry this year will show the same or a little more than the average return in 1927, notwithstanding increased production.

"The steel industry asks no quarter," he said; "it is not appealing for Government protection or legislation to take care of its surplus. In the last few years it has spent hundreds of millions to reduce the cost of making steel; it has gone the limit to meet the demands upon it. If it has resorted to mergers, it is because in no other way could it assure commensurate return on its invested capital.

Time for Large Buyers to Think

"Certain executives and buyers, often by adroit, inferential misrepresentation and even falsifying, are making futile the efforts of discriminating buyers who are withholding unwarranted pressure. Such buyers, and not the steel industry, will be responsible for the consequences. It is a fair warning that it is time for the mass buyers of steel to stop and think. Obviously, they cannot insist on paying a higher price than they are offered, but they can, in their own interest, recognize that steel is being sold too cheaply and give the steel industry fair opportunity to extricate itself from its serious predicament."

Too-Exacting Specifications Mean Losses

An instance of the loss imposed on the sheet steel industry was cited by Mr. Charls in the exacting specifications of buyers. It has come to the point, he said, that "ordinary quality is rejected, extraordinary quality is questioned, superlative quality is merely acceptable and perfection is demanded.

"While it is praiseworthy of Americans that their demand for progress and improvement in performance and style is insistent and insatiable," he added, "there must be reason in all things and these admirable qualities must not lead to extravagance and loss.

"Only the wonderful ingenuity of the research departments of the steel producers in studying the effect of grain growth and its relation to ductility and tensile strength has made possible the great saving in deep-drawing cost. One does not have to go very far back to a time when such direct deep-drawing operations were inconceivable, and frequent reheating to the detriment of the surface was necessary. Great savings and utilities have been effected by fine qualities of deep-drawing, flat rolled steel, but there are practical limitations which must be recognized. The impractical specification results in unnecessary loss.

"A worth while saving in the cost of flat rolled steel could be made if the purchasing agent, representing the designing engineer and the production and inspection de-

partments of the fabricators, could meet with a committee of flat rolled steel manufacturers to adopt practical and reasonable specifications and standards covering the different grades of flat rolled steel used in their industry.

Buyer Should Know Mill Practice

"The purchasing agent should have very definite knowledge of what constitutes practical mill practice and should use his influence to have his designing and production departments adopt standards and specifications which are reasonable and practical, and he should permit no fanciful

ideas of specifications or designs to impose undue losses and unwarranted hardships upon the producer of steel or in his own factory operation."

Mr. Charls said that the question of gages of flat rolled steel becomes more involved each year. A greater knowledge of gages was urged. Unnecessary confusion would be eliminated by the use of the United States gage, expressing the true decimal thickness of each gage. A movement to concentrate on the actual thickness of steel under the United States gage would be of great benefit to the producer, the fabricator and all other consumers.

Airplane Makers Plan for Mass Production

Uncertainty as to Trends in Design and Need of Standards Are Checks to Rapid Transition from Present Methods

DIFFICULTIES besetting the manufacture of airplanes in quantity, or under mass production conditions, were told at a recent meeting held under the auspices of the American Society of Mechanical Engineers at Wichita, Kan. Among the papers submitted were one by E. E. Porterfield, Jr., American Eagle Aircraft Co., and one by Walter H. Beech, president Travel Air Mfg. Co., Inc., Wichita, Kan.

Must Settle on Type of Motor

Although we have promise of new production motors in adequate quantity, and at prices which will permit their use in the medium and lower priced plane, Mr. Porterfield said we are still struggling with the problems arising with our present motor supply. In the first place, no single new production power plant has proved itself to be outstanding. In fact, no two or three engines have developed what might be called public preference. It has, therefore, been necessary for the manufacturer to diversify production to satisfy a wide range of public demand. The result is reduced production and increased production costs.

The motor situation, he added, is largely duplicated in much of the materials used in plane construction. "The industry has actually grown so fast within the past two years that the sources of material have proved entirely inadequate. The manufacturer, unfortunately, has been entirely dependent upon independent sources for practically his entire list of materials used in plane construction. However, whereas a year or two years ago, the business of supplying airplane materials was incidental to other lines of business, we have today a group of organizations handling airplane supplies exclusively, or specializing in the materials our industry demands.

"We have found it almost impossible to gage public demand," he continued. "Fortunately, so far, we have underestimated it. Fortunately, I say, for such a condition leaves us financially safe for the moment. But it adds to our problem. Public demand is calling upon us early for large scale production. Still, we find ourselves with many of our initial problems unsolved and with our policies consequently undetermined. The industry is still in its formative period, even though we may say that we are approaching a close of that stage."

Design Trend Not Yet Clear

As a result, Mr. Porterfield said, we are facing the problem of constantly increasing production without being sure of the ground over which we must travel. "None of us knows what the trend of public demand may take a year

from now—or even a month hence. We haven't by any means completed our engineering and research work. We are not by any means satisfied with our present product and present methods, satisfactory as they may be. Therefore, no manufacturer cares to invest heavily in machinery and equipment necessary to make large scale production possible. As a result, we are faced with the alternative of forcing production through the continued use of our present methods, namely, through hand work, or small machine tool work, upon materials provided through outside sources."

In concluding he agreed that the continued success of the industry demands the use of efficient machinery for large scale production. Also there must be standardization of product, of methods and of materials. "The manufacturer obviously must cease to experiment with a dozen different types of planes and motors. He cannot hope to continue, as he has in the past, a system which makes practically every ship an individual production problem."

Why 140 Airplane Makers Today

Mr. Beech pointed out that anyone with a few tools, an acetylene tank and blow torch, some steel tubing and an engine on order can start "manufacturing" airplanes. This condition is unfortunate, he argued, because it permits many people to enter the business who are not adequately equipped in experience and financial backing, and accounts in part for the existence of some 140 or more airplane companies in the United States today.

At present there are 15 departments in the Travel Air factory, each in charge of a foreman and a few with sub-foremen. These departments are: Welding, two fuselage assemblies, fuselage paint, wing paint, milling, wing assembly, final assembly, testing, maintenance, transportation, office, engineering, stockroom, first aid and safety.

Procedure in Travel Air Factory

"Let me now for a moment trace the production of a ship through our factory," said Mr. Beech. "At the west end of factory A the fuselage is begun. Tubing is drawn out of the stockroom nearby, cut to the proper lengths on a tubing saw, welded up on jigs, the engine mount built up and bolted on. The fuselage then passes down the line through the fuselage assembly department. The fitting department occupies the side of the building at this point. Here the completed fittings are assembled on the fuselage. The wire department occupies a balcony on one side, and the upholstering department occupies a balcony on the other side. The purpose of these balconies is to concentrate the parts departments near the assembly department,

see that wires, fittings, etc., will not have to be moved more than a few feet before they can be assembled on the ship.

Next the engine is installed in the plane and the cowling and tanks are added at a point opposite the sheet metal department. The fuselage is then covered and passes into the dope room. Dope and paint are sprayed on and the fuselage passes out into the final fuselage assembly department. Here the landing gear, tail surfaces and center section are assembled.

Factory B abuts factory A. Passing to the far end of factory B, we find the mill room. Here lumber is milled to the proper size and shape for wings, turtle backs, and cabin framework on the monoplane. The parts are assembled in the wing assembly department, which joins the mill room. The fittings are added and the wings covered. The wing then passes into paint and dope room No. 2.

The completed wing is moved to the final assembly and rigging department, where it is dropped on the fuselage, which has been moved across the court from factory A. After the ship has been rigged, it is given a final inspection and then test flown.

When More Metal Will Be Used

As to the production methods of the future only a guess can be made. We feel the use of machinery will increase and as a result metal will enter into the construction more and more. Metal wings will be justified as soon as production amounts to a scale which permits the investment in the necessary equipment for their construction. Machined fittings will replace welded fittings, when the quantity of fittings produced is such that the machinery necessary to produce them will pay for itself.

Improved Die Steels for Aluminum Die Casting Industry

ABOUT six years ago it was generally accepted that the question of die steels was the "neck of the bottle" in the aluminum die casting industry, writes Sam Tour in *Mining and Metallurgy* for September. Dies lasted for an average of some twenty thousand castings. Before replacing a die it was customary to make thousands of castings from it which had to be ground all over in order to remove fins left by numerous die cracks. For example, dies for making waffle grids would show cracks after only a few thousand castings and seldom was it possible to make more than 10,000 before replacing the impression block. Other difficulties were warping, and the growing or shrinking of the steel dies during the heat treatment, resulting in mismatch of the two halves.

The industry was then using a chrome vanadium steel. It was the general understanding, gained from such unknown source, that nickel steels were not satisfactory for dies due to the solvent action of aluminum, and that tungsten steels would not withstand the peculiar type of thermal fatigue encountered. About four years ago both of these

general understandings were proved to be false. Several new steels were developed, one containing nickel and the others containing considerable tungsten and chromium.

Larger dies are now being made than ever before. Waffle grid impression blocks give from 50,000 to 100,000 castings before being replaced. Automobile steering wheel spider dies which used to last only for 20,000 castings now last for 70,000 to 100,000. It is only necessary to grind a very small percentage of the aluminum die castings produced.

These new steels are not perfect. They have certain inherent faults such as brittleness, but they are a vast improvement over the old chrome vanadium steel. It is hoped that the present steels will be further improved or that still newer types will be developed that will retain the good qualities of the present steels and will not have their faults. Future progress of the industry however will not be seriously hampered by steels for several years at least. There are other questions in the industry now that are "the neck of the bottle."

Advantages and Limitations of Chrome-Irons for Condenser Tubes

REALIZING that steam superheaters are subjected to more severe working conditions than high-pressure boiler drums, Brown, Bayley's (Sheffield, England) research laboratories are studying the action of tubing under working conditions. Three classes of metal are under observation, a nickel-chromium-iron alloy, a chromium-iron alloy and mild carbon steel.

Tests are carried out by passing steam through the tubes, the steam entering at a temperature of about 750 deg. Fahr. and leaving at about 1000 deg., the temperature of the tube being kept at about 1000 deg. Fahr. by passing an electric current through it. Tubes of the alloy irons were found free of attack after several weeks. The result with mild steel, however, was unsatisfactory. The tests proved the immunity of nickel-chrome-iron and straight chromium-iron alloys from oxidation, and assuming such heat-resisting tubes could be manufactured at a reasonable price, it would enable higher steam pressures to be used with safety. Previous experiments had proved similar reactions to hot furnace gases.

Whether tubes of such alloys will stand high internal pressure at high temperature has yet to be proved. Prof. F. C. Lea, speaking before a recent meeting of the British Association for the Advancement of Science, said that experiments dating several years back proved without doubt that a metal which had an ultimate strength of 45,000 lb.

per sq. in. in tension when tested in the usual way at room temperature would break at 12,000 to 14,000 lb. after exposure to a temperature of say 900 deg. Fahr. for several weeks. Special anti-corrosion steels have a much longer life than plain carbon steel at the higher temperatures, but even with them the working temperatures ought to be considerably below 1500 deg. Fahr.

Recent experiments had shown that even some of the best steels for resisting high temperature would, at a temperature of 1500 deg. Fahr., have their strength reduced from, say, 33,000 lb. to 4500 lb. per sq. in. in 53 weeks, and he had estimated that in 1½ years the strength would be reduced to 2200 lb. per sq. in. Therefore, it was apparent that above an undefined temperature between 900 and 1500 deg. Fahr., small changes of temperatures meant very considerable changes in the limiting creep stress.

Methods of test relating to electrical insulating materials have been published by the American Society for Testing Materials in a book of 155 pages illustrated. This has been issued to present under a single cover what the society believes would be important to those interested. The committee active in this work has been engaged for several years in drawing up methods of testing and improving upon those in use. The pamphlet gives what are considered the best methods available.

Steel Plants Using Oil-Electric Engines

Industrial Service Follows Experiments by Railroads for Yard Switching—Savings in Costs

THE comparatively recent development of the oil-electric locomotive is of interest not only because it offers a potentially large field for the use of steel—a factor of no mean importance in view of the small purchases of steam locomotives in the last few years—but because of its adaptability to the needs of large industrial plants, such as those of the steel companies.

Late last year the American Rolling Mill Co. ordered one of 300 hp. capacity for trial at its Ashland, Ky., plant. Since then the company has bought three more of the same size for the Ashland plant, and one of 600 hp. capacity for its Middletown, Ohio, plant. The Donner Steel Co., Buffalo, purchased a 300 hp. engine in April of this year, following with an order for three additional units.

The hourly operating cost of an oil-electric locomotive will vary, it is stated, according to the work as-

signed. For the 300 hp. engine, it varies from 20c. to 40c. per hr., and for one of 600 hp. from 28c. to 50c. per hr. These costs are contingent upon the prices for fuel and lubricating oils in the localities in which the engines are operating.

The oil-electric engine first demonstrated its possibilities in marine propulsion, but up to the present its application to railroad propulsion has been relatively limited. The automobile has shown the efficiency of the internal combustion engine, while the electric drive in its various applications has been recognized as offering an easily controlled form of power transmission. It has been through a combination of these two principles that the oil-electric engine has been evolved.

Development work was undertaken by three companies acting in cooperation. The General Electric Co., the

American Locomotive Co. and the Ingersoll-Rand Co. supplied the varied types of experience required in electrical engineering, locomotive design and construction of the internal combustion engine. The engine finally developed combines one or more Ingersoll-Rand oil engines direct-connected to a General Electric d.c. generator, which supplies electrical energy to traction motors mounted on the trucks. The oil engine is of the vertical, six cylinder, four cycle, single acting, variable speed type, having direct fuel oil injection. Fuel oil injection is accomplished by means of two spray nozzles in each combustion chamber. To these nozzles oil is delivered under pressure by an injection pump driven from the main shaft. No compressed air is used for fuel injection. Ignition is produced by the heat of compression only.

Other features of the oil engine include a distributor timed to admit oil to the spray nozzles of each cylinder in their proper firing order; a lubricating system entirely enclosed and of the force-feed type, and a closed cooling water system, the water

A 300-Hp. Oil-Electric Engine Hauls Ingot Molds at the Plant of the American Rolling Mill Co., Ashland, Ky.

being circulated by a centrifugal pump driven from the crank shaft.

In operation, the electric control handle is set forward or backward, with the motors in series for speeds below 5 miles per hr. or in parallel for speeds above 5 miles per hr. The position of the throttle lever determines the power delivered by the engine, and the generator and motors transmit the power to the driving wheels, automatically adjusting the proportion of tractive effort and speed to the load on the locomotive, and automatically changing these proportions to suit the varying requirements of acceleration or grade.

While the development of the oil-electric engine to date has been chiefly in connection with its serviceability for low-speed switching service, it is

A 60-Ton Oil-Electric Locomotive in Service at Plant of Donner Steel Co., Buffalo

believed to offer future possibilities for main line railroad service. One of 750 hp. capacity has recently been

delivered to the New York Central Railroad for use on its Putnam division in New York State.

Tandem Blow-Off Valves Have One-Piece Body

BOILER inspection laws of most States demand the use of two valves in tandem in the blow-off line from a steam boiler. Ordinarily, two separate valve bodies are used. Generally one of the valves is of a special form designed to avoid or reduce

single, forged-steel body. The valve nearer the boiler is of the rotating gate type, and in ordinary operation is intended to be opened before the main valve is opened and to be closed after the main valve is closed. The gate member is conical and is ordinarily

Two Sections (at Right Angles) Through the Valve Chambers, Both Being Closed. Boiler pressure is held by rotary gate A, by scaling valve C and by check disk D

erosion of the valve disk and seat by the hot water and sludge discharged at high velocity under boiler pressure.

The valve illustrated has been designed by the Cochrane Corporation, Philadelphia, to meet these exacting requirements. There are two main valves in tandem, as required by law, but both valves are combined in a

held to its seat by a seating spring and by the water pressure.

So that it may be turned easily and without scratching of valve or seat, provision is made for lifting it from the seat before it can be turned. The valve member is a one-piece, stainless steel forging, which has been hardened and ground.

New Close-Quarter Drill

A NEW gear-driven close-quarter drill with a two-cylinder double acting air motor has been developed by the Ingersoll-Rand Co., 11 Broadway, New York. It was designed for general drilling, reaming and tapping in close quarters. It weighs 41 lb. and is 9¼ in. long. The length of feed is 2½ in.

Minimum thickness of the machine has been secured by making it flat, the drill being practically the same thickness from spindle to cylinders. It can therefore be readily used in very cramped places. Smooth operation has been secured by arranging

the pistons to act at right angles to, and in a plane with, the spindle; by

Flatness of This Close-Quarter Drill Is a Feature

using a counter-balanced crank and by using special gears for the drive.

Gears are built strong and rugged, their size and strength being increased as the load carried increases, until the final drive on the spindle is through a heavy herringbone gear, which gives a smooth and steady driving action. Anti-friction bearings of the ball or roller type are used throughout.

Three different spindles can be furnished, the standard spindle having a No. 4 Morse taper socket. A threaded spindle 1-11/16 in. in diameter, 12 threads per inch, to take square socket chucks or the Rich chuck, can be had. The third spindle obtainable is a Use-Em-Up spindle which has a No. 4 Use-Em-Up taper.

Sharp Gain in Electric Power Production

Production of electric power by public utility power plants in the United States in August is reported by the Geological Survey at 7485 millions of kilowatt-hours. This compares with 7140 in July and 7010 in June. Water-power furnished a smaller amount in August than in either of the two immediately preceding months, representing about 41 per cent of the total in August, against 43 per cent in July, and more than 44 per cent in June. Correspondingly, the power produced by the consumption of fuels in August was nearly 10 per cent above July and 13 per cent above June.

Foreman Is Key Man in Safety Work

Department Head Is Largely Responsible for Safety Education of Workmen—Mechanical Handling Is Factor in Foundry

THAT the education of every person connected with the foundry to think, act and live safety is the keynote of accident prevention work in that department was emphasized by Nelson H. Kyser, safety engineer, Studebaker Corporation, South Bend, Ind., in an address before the metals section of the National Safety Council assembled in New York last week. This personal education, the speaker pointed out, should begin with cleanliness. "A clean orderly shop," he said, "means careful workmen and greatly reflects the quality of the product. If aisles and passageways are blocked or are strewn with foreign matter, the possibility of spilling a ladle filled with molten metal is greatly increased. If flasks are piled so that they may topple over, the hazard of crushing or badly lacerating a fellow workman is present. Teaching a man or allowing him to develop the proper and safe method of doing a job is also important. The employee should be cautioned against using a rusty skimmer or rod when skimming or stirring molten iron. The pouring of molten metal into moist ladles should also be cautioned against, as also should the watching of a mold up through the risers without the necessary goggles. Proper clothing must also come in for its share of consideration in the correction of unsafe practice in foundries."

The correction of unsafe foundry practice or the elimination of hazards caused by layout, the speaker stated, are just as important as personal education. In his opinion the more mechanical devices that are installed the less will be the possibility of accidents. "In the mechanical handling of raw stock," he said, "magnetic cranes can be brought into use for the pig iron and scrap, while hopper bottoms bins make a safer and easier way to handle the non-metallics. All the ingredients of the charge may be loaded into small cars, weighed and transferred to the charging floor untouched by human hands. This practice will eliminate crushing injuries and also the possibility of disablements caused by the strain of over-lifting.

"After the charge is on the charging floor it should be mechanically dumped into the cupola. This method will avoid hand shoveling of the charge, where a man is apt to slip and fall into the mouth of the cupola. Serious thought should also be given to proper ventilation, as the gases on the charging floor are poisonous, and when ventilation is inadequate res-

pirators should be furnished to the workmen. One of the most important applications of mechanical means is in the pouring of molten metal. If the conveyor system for carrying the molds could be installed universally one of the greatest foundry problems would be solved. If the mold could be placed on conveyors and transferred to a point 25 ft., or not over 50 ft., from the cupola and poured, relatively few men would be brought into the danger zone. The installation of this type of conveyor system would eliminate the inspection of long monorail systems, the danger of slop over would be cut to a minimum and the use of hand ladles would become obsolete.

"The shipping and grinding department should be in a separate room from the rest of the foundry. This room should be well lighted and ventilated and all workmen should wear goggles and hard toed shoes to avoid eye and foot injuries. The various tools should be frequently inspected for their suitability and condition. The use of chisels with mushroom tops is dangerous and should be avoided. The chipping room should be large enough to allow considerable distance between each chipper, as flying chips often cause injuries."

Much Depends Upon Foreman

The key position of the foreman in making safety work successful was stressed by Dominic Samuel, foreman tube galvanizing department, Campbell plant, Youngstown Sheet & Tube Co., Youngstown. He stated that, in eliminating the hazards of his department, he soon found that the attitude of the men was the most serious danger of all. This was gradually corrected by safety meetings, the posting of warning placards, and, most important of all, by individually talking to the men on the job and making certain that they knew how to do their work safely and right.

The responsibility of the foreman was also brought out in a novel manner in a debate between J. A. Voss, director safety and compensation, Central Alloy Steel Corporation, Massillon, Ohio, and Michael P. Grady, president Stark County, Ohio, Foremen's Club. In outlining the procedure for the organization of a safety campaign, Mr. Voss pointed out that the first move is to interest the management; second, the superintendent; third, the foremen, and, fourth, the workmen. The importance of educating the workmen, the responsibility of which depends largely upon the foremen, is evidenced by

accident statistics showing that 25 per cent of accidents are preventable by safeguards and 75 per cent by education. Both men were agreed that one of the best ways of training the workmen to do their work safely is to call them together every two weeks and discuss safety problems.

Mr. Voss stressed the fact that, although the management and the superintendents may be ever so enthusiastic about safety, the foremen must be just as enthusiastic and must constantly plan and scheme to keep every man in their various departments enthusiastic. One way of doing this is by means of the safety committee, the members of which must at all times bear in mind that the prevention of accidents is one of their most important duties. Mr. Grady told of the reluctance of many foremen to place their best workmen on the committee. This attitude, it was explained, can usually be changed by demonstrating to the foremen that safety work is one of the most important factors in maintaining satisfactory uninterrupted production.

Safety as Aid to Department Efficiency

The value of safety work in maintaining the efficiency of a department was the main theme of an address by Philip J. Bowen, foreman annealing department, Michigan Steel Corporation, Detroit. "The first big step in making a safety plan successful," he stated, "is that every foreman know his own men. Knowing the men means that the foreman understands thoroughly their temperaments and characteristics. He should also do his best to gain their confidence by being consistent in his daily practices. He should make a thorough survey of his working equipment at the beginning of each day and see that all working implements are in good safe condition before the men start operations. This will show the employees that the foreman is sincere in his efforts to safeguard their lives and will have a striking effect upon their morale. It is often a good idea to give each man something to do, such as the responsibility for the inspection of some machine, and thus create an individual interest in the safety movement."

The new 6-stand 4-high, roller bearing continuous 13-in. skelp mill, which the National Tube Co. will install at its National Works, McKeesport, Pa., will be furnished by the United Engineering & Foundry Co., Pittsburgh.

Engineers Hold New England Meeting

Airplane Engines, Textile Machinery and Apprentice Training Included in Broad Program

WITH 10 technical sessions devoted to as many different topics, the New England Industries meeting of the American Society of Mechanical Engineers, held at the Hotel Statler, Boston, Oct. 1, 2 and 3, was of broad scope.

The sessions were under the auspices of various divisions of the society, and topics covered included materials handling, management, industrial education and training, machine-shop practice, aeronautics, railroads, and power. There were also meetings of the research and other committees, and outstanding among social events was a banquet and dance held on the evening of Oct. 2. Excursions to the plants of the General Electric Co., West Lynn; Ford Motor Co. assembly plant, Somerville; and the Gillette Safety Razor Co., Boston, were well attended.

Steel Makes Up Half the Weight of Aircraft Engine

Interesting data relating to the arrangement, selection of materials, manufacture, inspection of parts and application of the Wasp and Hornet engines to aircraft were given by A. Willgoos, chief engineer of the Pratt & Whitney Aircraft Co., Hartford, at the aeronautic session. The Wasp and Hornet engines are similar in design, 81 per cent of the parts being the same in both.

In discussing the weights of the various materials used in the Wasp engine the following percentages were given: Aluminum, 33.4 per cent; duralumin, 8.6; copper, brass and bronze, 3.64; rubber, paper, etc., 0.16; and steel and iron, 54.2 per cent.

"It is rather surprising to find that in a unit in which light weight is important, more than half of the weight is made up of steel," said Mr. Willgoos. "Aluminum and its alloys are used as far as possible, but for highly stressed parts there is often no advantage in their use. While aluminum weighs one-third as much as steel, it is not as strong as alloy steel and sections cannot always be increased to offset the reduced strength. For other parts extreme hardness is required and obviously this indicates the use of steel."

Inspection methods were described at length, the thoroughness and care of the inspection work being particularly emphasized.

Other papers at this session were "Air Transportation in Relation to New England," by Sumner Sewall, Colonial Air Transport, New York, and "A Review of Ball and Roller Bearings in Aircraft," by F. W. Mesinger, Norma-Hoffman Bearings Corporation, New York. S. W. Stratton, president of the Massachusetts Institute of Technology, presided.

Some of the methods employed at the Auburn, R. I., plant of the Uni-

versal Winding Co., were outlined by J. F. McEnneny, superintendent of that plant, at the session devoted to machine-shop practice. The high standards of engineering and manufacturing technique in textile machinery building were emphasized, engineering opportunities in this field being said to be equal to those of other branches of the metal working industry.

"Competition in the field of textiles is very keen and mill owners are demanding machinery that will speed up production and minimize the human factor," said Mr. McEnneny. This demand has meant, to many textile machinery builders, changes in design, materials and in manufacturing methods. Mechanism having a large number of small parts that must function and interchange in textile machinery used all over the world call for methods that assure accuracy and interchangeability of those parts.

Several special-purpose high-production machine tools developed by the company were shown by lantern slides, and inspection methods, starting with frequent check up of tools and equipment, were outlined.

Internal Grinder Development Reviewed

"Internal Grinding Development," a paper by Alden M. Drake, chief engineer of the Greenfield Tap & Die Corporation, Greenfield, Mass., described briefly the various machines brought out since hardened pieces began to be used extensively.

At first the pieces were ground in the engine lathe, using a home-made attachment. A bench lathe and a universal grinder with internal grinding attachments were made available later, these being followed by a "cup and cone grinding machine" developed by the Pratt & Whitney Co. The arrangement of this machine, as well as the Heald, Bryant, Landis and other internal grinders, was outlined.

Written discussion was submitted by J. R. Weaver, superintendent of manufacturing equipment, Westinghouse Electric & Mfg. Co., East Pittsburgh. The high speed and close accuracy of the modern internal grinder was commented upon in the general discussion.

"Proper General Management of Industry," a paper by Jerome R. George, vice-president Morgan Construction Co., Worcester, was presented by C. E. Davies, assistant secretary of the society, at a session held under the auspices of the A. S. M. E. management division. "In the end the public will decide whether or not industry is being properly managed," said Mr. George. "Generally speaking and in the long run, a manager of an industrial corporation who does not keep in mind the public relationship of his work will do harm

to the public interest and to industry. On the other hand good management of public affairs will give business reasonable regulation and protect it against unfair attacks by selfish interests from within and without." Thirteen comprehensive aims and rules of general management were set forth in the paper.

The opportunity of the engineer in reducing the cost both of manufacture and distribution was emphasized by W. J. Fortune, assistant vice-president of the National Shawmut Bank of Boston, in a paper on "Progress in New England." The trend toward research in industry and in business was pointed out and in this connection Mr. Fortune said: "To the admitted ability of the New England manufacturer to sell, he is to a greater extent adding essential facts contributed by scientific research. The rule of thumb method is giving place to guidance by essential basic facts."

Apprentice Training at Lynn, Mass., Plant

Description of the apprentice system of the Lynn, Mass., plant of the General Electric Co., by Charles K. Tripp, supervisor of apprentices at that plant, was a feature of the session on education and training for the industries.

Four major courses are offered, machinist work, drafting, pattern making and molding. There are also four special courses, sheet metal working, steam fitting, testing and factory business. All courses are on a four-year basis. Apprentices taking the machinist trade, drafting, electrical testing or factory business courses are required to spend two years in the training room for machinists. After they have completed their term they are given an opportunity to work at the trade for which they show the most talent.

The machine shop is the principal training room and is laid out so that all apprentices start on the same class of work and under the same instructor. As soon as they have learned how to do an operation they are advanced to a different machine where they are required to do work of greater precision. There is no definite schedule of advancement in shop work, the work given an apprentice being determined by his ability and capacity. Most of the instruction is traditional.

The beginner is put at a machine with an apprentice who has learned to do a certain job to the satisfaction of the foremen. The apprentice acts as a teacher to the beginner, who when he has learned to do the work as well as his teacher, acts as an instructor to another boy. The boys are supervised by experienced instructors. Of the 12 shop instructors seven are graduates of the Lynn apprentice course, and five are journeymen machinists who are selected for their production ability, as well as their capacity for teaching. From 15 to 20 apprentices are under the supervision of each instructor.

After the apprentice learns to op-

erate the machines satisfactorily, he is given opportunity to apply his experience to the building of a jig, fixture or machine. All apparatus manufactured in the training room is selected from the different production and tool departments for its educational value rather than for its simplicity. The finished work is given rigid inspection by the general inspection department of the plant. It was stated that the amount of spoiled work is small, less than 2 per cent.

Results of different methods of selecting apprentices at the Scovill Mfg. Co., Waterbury, Conn., were given by W. S. Berry, director of training of that company, in a paper on "Experience in the Selection of Apprentices with the Aid of Tests." The studies described were begun in 1923 and the data given cover a period of four years.

Papers at the materials-handling

session covered the handling of marine shipments of pulpwood and of materials in sugar refining. The mechanical handling of lumber was described at the wood industries meeting, at which a progress report of the society's special research committee on wood-working saws and knives was also presented.

Speakers at the banquet, which was well attended, included Dr. Ira N. Hollis, past president, and Charles L. Newcomb, vice-president of the society. Lieut. S. L. Willets, aeronautical division of the Department of Commerce, spoke on the development of commercial aviation, and Dr. Harrison E. Howe, editor of *Industrial and Engineering Chemistry*, discussed the "Place of Research in the New Competition," with special reference to developments in the field of chemistry. Charles C. Peirce, General Electric Co., Boston, was toastmaster.

Third: To avoid misrepresentation and sharp practice in our purchases and sales, recognizing that permanent business relations can be maintained only on a structure of honesty and fair dealing.

Fourth: To be courteous and considerate to those with whom we deal, to be prompt and businesslike in our appointments, and to carry on negotiations with all reasonable expedition so as to avoid trespassing on the rights of others to the time of buyers and salesmen.

Fifth: To avoid statements tending to injure or discredit a legitimate competitor, and to divulge no information acquired in confidence with the intent of giving or receiving an unfair advantage in a competitive business transaction.

Sixth: To strive for simplification and standardization within the bounds of utility and industrial economy, and to further the development of products and methods which will improve industrial efficiency.

Seventh: To recognize that character is the greatest asset in commerce, and to give it major consideration in the selection of customers and sources of supply.

Eighth: To adjust claims and settle disputes on the basis of facts and fairness, to submit the facts to arbitration if a mutual agreement cannot be reached, to abide by the decision of the arbiters, and to resort to legal measures in commercial disputes only when the preceding courses prove ineffective.

Ninth: To provide or accept no gifts or entertainment in the guise of sales expense, where the intent or effect is to unduly prejudice the recipient in favor of the donor as against legitimate competitors.

Tenth: To give or receive no bribes, in the form of money or otherwise, in any commercial transaction, and to expose commercial bribery wherever encountered for the purpose of maintaining the highest standard of ethics in American industry.

Code for Buyers and Sellers Suggested

Conference Held Under Auspices of Purchasing Agents' Association Declares Mutual Confidence Is Greatest Need

THAT full confidence between buyer and seller is the greatest need of American business today was the expression of business executives at a meeting held recently at the Hotel Commodore, New York. The group consisted of R. W. Babson, Babson's Statistical Organization; L. F. Boffey, editor *Purchasing Agent Magazine*, New York; A. M. Bowman, purchasing agent, Humble Oil & Refining Co., Houston, Tex., and president National Association of Purchasing Agents; L. A. Jones, vice-president and purchasing agent, New York Power & Light Corporation, Albany, N. Y.; W. A. Marshall, president W. A. Marshall & Co.; W. W. Nichols, president Machinery Builders Society; G. A. Renard, secretary-treasurer National Association of Purchasing Agents, New York; R. M. Roosevelt, vice-president Eagle-Picher Lead Co.; A. L. Salt, president Graybar Electric Co., New York, and E. L. Shaner, editor *Iron Trade Review*.

It was the nucleus of a committee appointed at a conference last May of representative manufacturers, sales executives, purchasing agents, and business paper editors which had been called by the National Association of Purchasing Agents to consider the responsibilities of the purchasing agent for the lack of profits by many manufacturers.

In its deliberations, the committee brought out that the much-talked-of effective cooperation can only be based on mutual confidence. Sellers, for example, should be given fair estimates of future consumption needs in order to gage their production as far as possible and thus prevent radical fluctuations within their industry. Buyers, on the other hand, maintained that confidence in the seller's fair-

ness, quality of merchandise, delivery promises, prices, etc., must also be established as a basis for cooperation. Both sides agreed that organization policies were too often entirely concerned with selfish interests and that an industrial code to which both buyers and sellers could subscribe should be made a basis for confidence and cooperation. Such a code, previously prepared by a group of the National Association of Purchasing Agents and indorsed by a number of very large organizations to whom it had been submitted, was unanimously adopted. It is the aim of the committee to secure widespread adoption of the code by representative buying and selling factors throughout the country.

Standards in Buying and Selling

The platform of sales and purchasing methods follows:

Unnecessary sales and purchasing expense is an economic waste, a tax on legitimate industry. Its elimination will assure satisfactory profits to the producer, economy to the consumer, and greater efficiency in commercial relations.

We recognize that the concern which buys must also sell, that buying and selling are companionate functions, that sound commercial transactions must be mutually profitable, and that cooperation between buyer and seller will reduce the cost of purchasing, sales and distribution with consequent benefits to industry as a whole.

In furtherance of these principles, we subscribe to the following standards in our buying and selling.

First: To buy and sell on the basis of value, recognizing that value represents that combination of quality, service and price which assures greatest ultimate economy to the user.

Second: To respect our obligations and neither expressly nor impliedly to promise a performance which we cannot reasonably expect to fulfill.

To Hold International Conference on Bituminous Coal

More than a hundred speakers, representing 12 countries, are tentatively listed to present papers at the second International Conference on Bituminous Coal, to be held under the auspices of the Carnegie Institute of Technology in Pittsburgh, Nov. 19 to 24, according to a preliminary program announced by President Thomas S. Baker. About 60 of the speakers will come from outside the United States.

According to the plans, 10 major subjects are listed for discussion, in addition to addresses of a general nature to be presented by Lord Melchett (Sir Alfred Mond), the British capitalist; Georges Claude, eminent French scientist; Prof. Fritz Hofmann, the German scientist, who makes synthetic rubber from coal; Dr. F. zur Nedden of Germany; F. G. Tryon of the United States Bureau of Mines, and others.

Major subjects to be discussed, it is expected, will include Pulverized Fuel, Gas Production, Liquefaction and Hydrogenation, Fertilizers, Origin, Composition and Classification of Coal, High - Temperature Carbonization, Combustion in Furnaces, Purification and Cleaning, Tars and Oils, and Low-Temperature Processes.

Opposition to Canadian Tariff Changes

Dominion Consumers Appear Before Board to Protest—Steel Companies Seek Protective Duties

OTTAWA, ONT., Oct. 9.—With the submission of the revised brief of the Algoma Steel Corporation of Sault Ste. Marie, Ont., for upward revision of the tariff on pig iron, structural steel, and abolition of prevailing drawbacks on specially treated steel and alloys, before the Tariff Advisory Board on Oct. 2, another case was placed on the agenda of adjourned hearings to be considered during the November sittings of the board.

Particular opposition to the final disposal of the case was voiced by R. E. Musselman, representing the Ford Motor Co. of Canada, who stated that the automobile industry was greatly concerned as to the effects of the proposed tariff revision. He urged that time be given for full study of the application. Others supported Mr. Musselman.

Objection to further adjournment was raised by Norman Guthrie, chief counsel Algoma Steel Corporation. The reference, he pointed out, had originally been placed before the board nearly two years ago and to ask for a delay at this stage "savoured of an attempt to defeat the desires of the applicants to bring the matter before Parliament during the forthcoming session." Mr. Guthrie also took exception to the filing of what he termed eleventh hour opposition briefs. This remark was provoked when John Blain, who spoke on behalf of the Ontario steel producers, announced he had been asked to prepare and file an opposition brief at a later date on behalf of the British Association of Steel Manufacturers.

Particular opposition was voiced against the incorporation of the following proposed clause in the Canadian customs tariff:

Steel in all forms or shapes, by whatever process made, and by whatever name designated, whether cast, hot or cold-rolled, forged, stamped or drawn, containing nickel, cobalt, vanadium, chromium, tungsten, molybdenum, also manganese or silicon when present in the steel in excess of 1 per cent manganese or 0.50 per cent silicon, or any other metallic content used in alloying steel—35 per cent ad valorem and British preference.

The general contention of the opposing interests was that such a provision would seriously limit the source of supply, increase prices and encourage substitution of alloy steel.

Railroads Oppose Restricting Steel Sources

Robert Job, speaking for the railroads, stated that it was essential to have safe, reliable steel for the manufacture of vital parts of locomotives and coaches. To compel the railroads to purchase inferior alloys or steel, would be to endanger the traveling public. He emphasized the importance of leaving the present

sources of tested alloy open to the railroads.

J. Robertson, for the Granby Consolidated Smelting Co., supported Mr. Job. He declared that alloys now imported were the result of years of experimentation and research. He expressed the belief that Canadian producers had not yet proved that a process of treatment superior to that given imported alloys had been evolved.

Referring to the objection that the application threatened the British preferential tariff, Mr. Guthrie declared that the clause in question probably had been hastily drafted and assured the board that his clients were prepared to modify their demands to meet the objection.

The Algoma Steel Corporation asks that the higher rate of duties on structural steel under 35 lb. per yd., and which the Customs Act provides to extend to larger sizes when all sizes up to 120 lb. per yd. are made in Canada, be now applied to all sizes already produced in this country, even though the complete range is not yet manufactured here. Several companies selling structural steel, while not opposing this application, thought there would be a lot of trouble with the customs authorities because each size of beams imported would necessitate finding out whether it were made in Canada before knowing whether it would come in under the low or the high duty. It was also pointed out that orders for structural steel are often placed six months ahead. The prices might be based on the lower tariff, and in the meantime some Canadian firm might start making the particular size, with the result that the higher rate would at once come into effect. Chairman Moore suggested that the representatives of the companies affected get together with the Algoma company

and endeavor to straighten out these difficulties.

Higher Rate on Pig Iron Opposed

The Algoma company's application for higher rates on pig iron brought definite opposition. The company claimed that the rates it was forced to accept for pig iron in face of United States competition gave it no profit at all. The increased duty was asked to give the company a fair profit.

A representative of the Canadian Car & Foundry Co., Montreal, told the board that in the making of cast iron pipe it would be impossible for his firm to pay more for pig iron than at present. If the price was increased, his company would have to close down that section of its operations. The National Iron Corporation, Toronto, and the Dominion Foundries, Ltd., took a similar position. Counsel for the Algoma company thought the situation should be solved by these companies coming before the board for an increased tariff on their products. The chairman suggested that a schedule giving the ultimate effect of the increase asked for would have to be submitted if there was any hope of Parliament giving the relief asked for.

The Algoma Steel Corporation based its claim upon the contention that Canadian iron and steel products are faced with exceptional handicaps in meeting foreign competition. Particular relief is sought to offset importation of pig iron, spring and axle steel for automobiles, alloy and structural steel. It is also urged that certain drawbacks be abolished, while an application is made for the imposition of a duty of 75c. a ton on imported coke. According to the brief, the Canadian iron and steel producers are faced with relatively higher costs of raw material, labor or transportation to consuming markets than foreign competitors.

Opposing the application were leading interests which would be directly affected by higher tariff on the commodities listed.

Philadelphia Scrap Dealers Organize

A group of iron and steel scrap dealers in the Philadelphia district, who met at the Manufacturers' Club, Philadelphia, on Oct. 2, organized a chapter of the Institute of Scrap Iron and Steel and elected John R. Briggs, Henry Potts & Co., chairman. Other officers are: Harry A. Kirshman, Allegheny Iron & Metal Co., vice-chairman; J. B. Partridge, Jr., Allen R. Hoffer Co., secretary, and R. M. Marshall, Marshall Iron & Metal Co., treasurer.

The Philadelphia chapter is the second organized in the past week. One in New York was formed with David Strauss, Continental Iron & Steel Co.,

chairman. A State conference of dealers in Connecticut is scheduled for Oct. 10, at the Bond Hotel, Hartford.

Applications for membership in the Institute of Scrap Iron and Steel, 11 West Forty-second Street, New York, have recently been received from the Allegheny Iron & Metal Co., Bishop & Co., A. Hitner's Sons Co., Allen R. Hoffer Co., Henry Potts & Co., Frank Samuel & Co., Louis J. Gedick, Marshall Iron & Metal Co., E. Perez, West Philadelphia Scrap Iron Co., Oscar H. Tompkins, M. J. Hunt's Sons, Malloy & Schreiner, all of Philadelphia; Mayer Pollock Co., Pottstown, Pa.; H. Sofransky Co., Allentown, Pa.; Valley Iron & Steel Co., Allentown, Pa.; H. Weiner & Co., Pottsville, Pa.; Fechter Steel Co., Allentown, Pa., and E. L. Halstead Co., Norfolk, Va.

Price Cutting Costly in Reinforcing Steel

Margin of Profit Growing Smaller in Industry in Spite of Increased Sales and Better Cooperation with Mills

GRATIFYING progress in securing the better cooperation of mills and in the extension of markets for concrete reinforcing steel was brought out at the semi-annual meeting of the Concrete Reinforcing Steel Institute, held at Shawnee-on-Delaware, Pa., Oct. 1 to 3. At the same time George E. Routh, Jr., Kalman Steel Co., Chicago, president of the institute, called attention, in his semi-annual address, to the deplorable condition of the industry's sales activities which has resulted from price cutting and lack of sincerity between competitors.

"I want to stress the need for serious thought on the part of all members toward this condition," said Mr. Routh. "We have too many detective salesmen seeking cut prices, with the result that the buyer is given every opportunity to put across the idea that he has a cut price although none exists. If a salesman were to approach the buyer with the sole intention of selling his company's materials and service, there would be far less talk and thought of cut prices and we would have a more stable market. Reasonable and proper merchandizing methods dictate that we should determine the cost of our product, to which we should add the proper over-

head expense plus a reasonable profit. Were our business put on this basis and the salesman given to understand that the price he is authorized to sell at has been based on a careful analysis of costs and is the price which he is expected to get, would he not display more salesmanship and spend less time seeking cut prices?

Relations With Mills Improving

Discussing the improved relations with the mills which have been developed during the last six months, Mr. Routh cited the recently adopted policy of the producers of abandoning the custom of cutting bars to length in accordance with the consumers' requirements and shipping only in 40, 50 and 60-ft. lengths. "The cooperation which we have received from the mills during the last three months," he said, "is evidence that they recognize our problems. We should show our appreciation by discontinuing the handling of foreign steel. We owe this to the mills. I might mention in this connection that the amount of foreign reinforcing steel being imported into the United States is apparently decreasing, on account of the difficulty of handling this material. It is not only difficult to secure this material by the time expected, but the quality of the

material is unsatisfactory because of the lack of uniform section."

The speaker stated that one large producer of reinforcing bars has made a financial subscription to the work of the institute. "This," he said, "we feel is an indication that the mills appreciate our efforts toward widening the market for reinforcing steel, and I feel sure that they will do everything they can to cooperate with us in the effort to have fireproof construction replace other types of construction."

Shipments Larger in 1928

Indications of a wider market for reinforcing bars were shown by the composite tonnage reports of the institute. During the first half of 1928 members increased their sales 11.6 per cent over the same period in 1927 and 7 per cent over 1926. Shipments in the first six months this year were 15.5 per cent higher than in the first six months of 1927 and 5.5 per cent higher than in 1926. "In spite of this increased tonnage," Mr. Routh stated, "the margin of profit in our industry has grown smaller, but hope of a better profit is promised through the improvement in the general steel market."

A paper dealing with the increase of this margin of profit by the control of selling costs, which was presented by Walter C. Conger, vice-president Truscon Steel Co., Youngstown, will be printed in abstracted

**WASTE PREVENTION
WEEK
BEGINS OCTOBER 15**

**"Turn the
Waste of Today
into the
Profit of Tomorrow"**

W. F. French
Pres. U. S. Steel Corp.

© 1928 Carnegie Steel Company - Subsidiary - United States Steel Corporation No. 1

Steel Corporation Plants Observe Waste Prevention Week

POSTERS to be displayed in plants and departments of the Carnegie Steel Co. during the week of Oct. 15—to be observed as "Waste Prevention Week,"—were designed by William F. French, public relations department, Carnegie Steel Co., Pittsburgh. Although intended for use by the Carnegie company, several other subsidiaries of the United States Steel Corporation have indicated a desire for a supply of the posters. The setting aside of a week in which to bring vividly to the minds of the employees the desirability of the prevention of waste is one of the outgrowths of the plans developed by the Department of Commerce under the direction of Secretary Hoover for increasing productive efficiency, not only by simplification of styles and types of products, but by elimination of wastefulness.

form in a forthcoming issue of **THE IRON AGE**.

Additional Cost Charges To Be Compiled

At the recommendation of the committee on engineering, selling and cartage costs, it was decided that, beginning Jan. 1, 1929, the Institute will compile monthly reports from members on cartage costs for the entire country with New York and Chicago shown separately; on engineering costs, including estimating, engineering and overhead, and on selling costs inclusive of all related activities both overhead and administrative. In the past the institute has confined its cost studies and reports to warehouse work operations. The additional reports are to relate only to reinforcing bars and spirals and not to accessories. Each member will report under a confidential key designation and the composite reports, while concealing the members' identities, will show the high, low and average costs. It was thought that extremely low quotations would not be made by certain fabricators throughout the country if definite knowledge of costs was obtainable.

Standard for Form Dimensions

At a session devoted to concrete ribbed floor construction, form manufacturers and dealers present asked that a special committee be appointed to work out plans for the setting up of a special department relating to that phase of the industry. The meeting was then turned over to P. H. H. Dunn, division of simplified practice, Department of Commerce, who led the discussion leading to a new recommendation to standardize upon form dimensions. The referendum of the Department of Commerce, which was made following a similar session at the Biloxi, Miss., meeting last year was not approved to an extent which would permit of adoption and the new recommendation will be subject to a similar referendum. The recommendation provides the width of standard forms to be 20 in. or 30 in. with depth of 6, 8, 10, 12 or 14 in. Depth is interpreted to mean the vertical distance from the under side of the concrete slab above the center of the form to the bottom of the concrete joist. Special filler forms, to be used as specials for fillers only, are to be either 10 and 15 in. or 12 and 16 in. in width.

Standardization Progressing

In the report of the committee on grade of steel and standard sizes it was brought out that the campaign for the adoption of the intermediate grade as the single standard for new billet reinforcement was meeting with considerable success and resulting in a saving to members by reduced stock piles and better service. It was stated that nearly all the present mill production of reinforcing bars was in the eleven standard sizes adopted by the industry through the cooperation of the Department of Commerce and

that there was also practically complete adherence to the four standard sizes of spirals.

New Members Added

The Peden Iron & Steel Co., Houston, Tex., and Woodward, Wight &

Co., New Orleans, were elected to membership in the Institute.

Charles M. Gunn, president Gunn, Carle & Co., San Francisco, was elected a director to fill the unexpired term of Edward L. Soule, who has resigned.

Chicago Promises Iron and Steel Meeting Three Technical Sessions and Well Planned Inspection Tours to Nearby Steel Plants

THE second national Iron and Steel Division meeting of the American Society of Mechanical Engineers will be held at the Palmer House, Chicago, Nov. 14 and 15. The Chicago section of the society will act as host. Besides a technical program, one of the biggest iron and steel centers of the country will offer numerous plants for inspection.

On the morning of Nov. 14 two papers are scheduled, one on heat economy in steel mills, and the other on sheet rolling. On Wednesday afternoon, Nov. 14, there will be two papers on cupolas and one on the manufacture of nickel steel plates.

For the dinner, planned for Wednesday evening, one speaker will discuss obsolescence and depreciation. The American Management Association is holding a meeting in Chicago at the same time and will join with the iron and steel engineers in the dinner meeting.

On Thursday morning there will be a session on bearings, metals and lubrication. Thursday afternoon is to

be given over to plant inspection visits. Arrangements have been made to see five of the large iron and steel plants in the vicinity of Chicago, namely: National Tube Co., at Gary; Illinois Steel Co., at Gary; Illinois Steel Co., South Works; Acme Steel Co., and Inland Steel Co., at Indiana Harbor.

The papers are as follows:

Heat Economy Progress in Steel Mills, by F. H. Willcox and Gordon Fox, Freyn Engineering Co.

Modern Methods of Wide Beam Rolling. Sheet Rolling.

Powdered Coal Cupolas, by O. H. Meloche, American Radiator Co.

Hot Blast Cupolas, by F. K. Vial, vice-president and chief engineer, Griffin Wheel Co.

Manufacture of Nickel Steel Plate, by Charles McKnight, Development and Research Department, International Nickel Co., New York.

Lubrication of Steel Mill Equipment, by L. P. Tyler, Vacuum Oil Co., Pittsburgh.

Non-Ferrous Bearing Metals, by M. M. Carl, Buckeye Brass & Mfg. Co., Cleveland, Ohio.

Milwaukee Metal Trades' Apprenticeship Dinner

Apprenticeship activities for the new season in the National Metal Trades Association at Milwaukee got under way on Monday evening, Sept. 24, when 145 executives and officials of metal trade shops attended the annual apprenticeship dinner at the Republican Hotel.

The purpose of the meeting was to create increased interest in apprenticeship through a discussion of its problems. In his opening remarks, Harold S. Falk, chairman, said: "I consider meetings of this kind an extremely important part of our apprenticeship work even in those shops in which the institution is firmly established. Officials of various grades are only too apt to find their attention withdrawn from apprenticeship problems by the every day pressure of work. Meetings of this kind keep the subject in the minds of those of us who are responsible for the success of apprentice training in the shops of our members."

John Goetz, Kempsmith Mfg. Co., and F. J. Roensch, Louis Allis Co., reported the year's activity of the expansion committee, which is responsible for the development of apprenticeship in the district. According to the committee's report, five plants

have put on apprentices for the first time during the last year.

By means of charts, W. J. Fairbairn, secretary Milwaukee branch National Metal Trades Association, pointed out that the number of apprentices in the district had increased from 450 to nearly a thousand during the last six years, that the great majority of apprentice graduates remain at work at the trade which they have learned and that apprenticeship seems to have a favorable effect on labor turnover, since those shops in the district in which apprenticeship is established have a much lower rate of turnover than those in which no apprentices are trained.

The following comprise the general apprenticeship committee of the National Metal Trades Association in Milwaukee: H. S. Falk, Falk Corporation, chairman; R. W. Buettner, Nordberg Mfg. Co.; W. M. Myers, Bucyrus-Erie Co.; Rene von Schleinitz, Harnischfeger Corporation, and William Watson, Allis-Chalmers Mfg. Co.

Vanadium Corporation of America, 120 Broadway, New York, has opened an office at 2245 Oliver Building, Pittsburgh, under direction of J. Alfred Miller, Jr., general manager of sales.

British May Increase Pig Iron Output

Stocks Low and Demand Exceeds Present Supply—French Domestic Requirements May Necessitate Greater Steel Production

(By Cable)

LONDON, ENGLAND, Oct. 8.

DEMAND for Cleveland pig iron is improving so that sales are now exceeding the output and stocks have diminished. Consequently there is consideration given to blowing in additional furnaces.

Hematite demand is also expanding and increased sales for export are placing makers in a better position. Foreign ore continues quiet and no revival in demand is expected this year.

Export demand for finished steel has improved, but actual sales are still difficult to negotiate. It is reported that an agreement has been reached among steel makers for raising foreign credits, but the plan applies only to certain branches of the Sheffield steel trade and not to the heavy steel industry.

Workman, Clark & Co. have received further orders for two 10,000-ton vessels for Andrew Weir and now have 100,000 tons of shipping contracts on hand. The Clyde output in September was 13 vessels of 69,000 tons. Thomas W. Ward has bought

Spencer's Newburn Steel Works, which may be dismantled, as efforts to preserve them have failed.

Tin plate is active with good buying by both domestic and export users, for deliveries up to June. Some mills are rather short of specifications for the last quarter of this year, but most are well booked with tonnage for first quarter and even first half of next year.

Galvanized sheets are quiet. Black sheets continue inactive, but prices for the heavy gages have been advanced because of the higher cost of foreign semi-finished material.

Continental iron and steel trade with British users is increasing and several thousand tons of 3 to 4-in. billets have been sold at prices ranging up to £5 2s. (\$24.79) per ton, f.o.b. Sheet bars have brought £5 3s. (\$25.03) per ton, f.o.b.

Export demand for finished steel is quiet here, but is still reported good from abroad. French production in August was 857,000 tons of pig iron and 793,000 tons of steel ingots and castings. Polish production in 1927 was 617,000 tons of pig iron and 1,246,000 of steel ingots and castings.

changed in the last quarter. The factors that caused advances in prices, however, are still operating. Early this year the proportion of exports to production was about 50 per cent, and today it is very much smaller because of continued demand from domestic consumers. Since early in June export quotations have advanced by more than 10s. (\$2.43) per ton on most products. Since Jan. 1 domestic prices have increased by 100 to 120 fr. (\$3.90 to \$4.68) per ton. The present level of the market is evidently satisfactory to producers, and no reduction of output is contemplated, as it might cause an unsatisfactory reaction. In fact, with deliveries ranging from four to six months on most products, it is believed that a further increase in output may be necessary. The French steel industry is beginning to approach an annual production of 10,000,000 tons, which will still be less than the full capacity possible, as the large plants in Lorraine are using only part of their capacity and some works in the North have not recovered since the war.

Pig Iron.—Production is increasing. The Societe des Acieries de France is blowing in a furnace on hematite at its Isbergues plant and contemplates putting two other furnaces in blast. At the meeting of pig iron producers in Paris, Sept. 20, prices were continued unchanged at 440 fr. (\$17.16) per ton for phosphoric foundry and 565 fr. (\$22.04) per ton, base Ardennes, for foundry hematite. Tonnages of iron placed at the disposal of domestic consumers for October were 36,000

French Prices Stabilizing

Mills Seek to Maintain Present Market—Greater Output Probable as Deliveries Are Extended

PARIS, FRANCE, Sept. 24.—Mills are engaged in an apparently successful effort to stabilize prices, being assisted

by the recent decision of the International Steel Cartel to maintain the production quotas of all members un-

British and Continental European prices per gross ton, except where otherwise stated, f.o.b. makers' works with American equivalent figured at \$4.86 per £ as follows:

(a) Nominal.

tons of phosphoric foundry and 35,000 tons of hematite. In October, 1927, the quantities available were 30,000 tons of foundry and 25,000 tons of hematite. The entente of French, Belgian and Luxemburg furnaces has continued its export prices for October.

Semi-Finished Material.—At the September meeting of the Comptoir Siderurgique it was decided to continue the domestic prices on all products, although a rising tendency is evident. Billets remain at 565 fr. (\$22.04) per ton, blooms at 535 fr. (\$20.87), and sheet bars at 600 fr. (\$23.40) per ton.

Finished Material.—Merchant bars are steady at 710 to 720 fr. per ton (1.25c. to 1.27c. per lb.) in the East and at 740 fr. per ton (1.30c. per lb.) in the North of France. The Comptoir Siderurgique at its September meeting decided upon an increase of 25 fr. (98c.) per ton in the price of beams. Angles are scarce, and demand for small sizes of round bars is heavy. The sheet market is active and prices are strong. The situation in the wire-drawing trade is unsatisfactory, as the price of wire rods is proportionately much greater than the prices obtained on wire products. This is the result of an entente of producers in the wire rod field and lack of organization among wire drawers. Recent negotiations of wire-drawing plants failed because of the opposition of one important company. Other makers, however, have agreed that action must be taken to form a purchasing committee, which would buy foreign rods if the domestic price continued too high.

French Automobile Merger Considered

PARIS, FRANCE, Sept. 24.—Manufacturers of automobiles are reported to be considering the formation of a large corporation, similar to the General Motors Corporation in the United States. No definite action is as yet reported, but the suggestion seems to have been favorably received by many companies.

Trend of European Wages Is Upward

HAMBURG, GERMANY, Sept. 22.—Wages in the European steel industry are constantly increasing. The average earnings of steel workers in Germany in 1925 were 0.68 m. (16c.) per hr., but in July of this year they had advanced to 1.08 m. (26c.) per hr. This average includes unskilled as well as skilled labor. On Sept. 20 an increase of 5 per cent was granted in the Saar steel industry, and on Sept. 1 the Czechoslovakian steel mills advanced wages 7.5 per cent. An increase of 2½ per cent in steel workers' wages took place in Belgium on Sept. 10. Luxemburg steel workers received a 3 per cent advance in wages in July.

At present, Luxemburg steel mill

employees are demanding a further increase of 5 per cent in their wages; Austrian workers, a 12 per cent increase; and German steel mill labor, 5 per cent. French workmen are expected to ask shortly for a 7 to 10 per cent increase.

South African Government Buys Steel in Germany

HAMBURG, GERMANY, Sept. 22.—Considerable interest has been aroused in the steel industry here by the announcement that the Government of the Union of South Africa has placed an order with the Deutsche Edelstahlwerke at Bochum for about 1000 tons of spring steel, tool and high-speed steel to the value of about \$260,000. This is said to be the first time the Government of a British dominion has placed an important order in Germany.

German Tube Association Buys Competitor

HAMBURG, GERMANY, Sept. 22.—The German Tube Makers' Association has bought the only non-member in Western Germany, the Rohrenwerk Luxemburger of Düsseldorf, and has closed the plant. This is expected to improve the position of the association in export trade, as the Rohrenwerk Luxemburger was a keen competitor, especially in the Near East. Sales of gas pipe for export have been satisfactory, but the seamless tube market is quiet.

Large Increase in Sheet-Metal Ware Shipments

Shipments of enameled sheet-metal ware in August are reported by the Department of Commerce at 358,811 dozens, valued at \$1,354,316, compared with 277,684 dozens in July, valued at \$1,059,547. August shipments were somewhat higher than those of a year earlier—329,843 dozens valued at \$1,278,013.

For the first eight months the shipments have been 2,770,676 dozens, valued at \$10,405,473, compared with 2,689,631 dozens last year, valued at \$9,505,737. The increase has been wholly in colored goods, the value of which has gone up more than 325 per cent; both white ware and gray ware have declined.

August shipments of galvanized sheet-metal ware are reported at 186,864 dozens, valued at \$746,580; this compares with 169,271 dozens in July, valued at \$677,451, and with 196,439 dozens in August, 1927, valued at \$715,343.

Shipments for the first eight months reached 1,584,508 dozens, valued at \$6,085,745, compared with 1,508,352 dozens last year, valued at \$5,678,957.

French Engineers to Visit American Plants

A delegation of French engineers, invited unofficially in the interest of international relationships and to further American exports, is scheduled to arrive in New York, Oct. 22, by the French Line steamer *De Grasse*. The party will also include Belgian and possibly Czechoslovakian engineers. While they will probably include Niagara Falls and Washington in their tour, their chief interest lies in visits to 23 plants in 13 cities. They are expected to leave New York on Nov. 14 by the *Rochambeau*.

The party will be in direct charge of Thomas Cook & Son, travel agents, and generally speaking is not expecting civic or association receptions on any formal scale. The committee on arrangements, of which Dr. Robert Grimshaw, 65 Jesup Place, New York, is chairman, reports that there will be a few special luncheons, including one to be given by the Cutler-Hammer Mfg. Co. and one by the Nordberg Mfg. Co., at Milwaukee. The invitations appear to have been extended only to members of the French Society of Civil Engineers and the equivalent Belgian and Czechoslovakian engineering societies.

Open Pittsburgh Office of Commerce Department

The new Pittsburgh office of the United States Department of Commerce, which, as announced in *THE IRON AGE*, was established Sept. 8, was formally opened Oct. 5 with an inaugural luncheon at the Chamber of Commerce, in the building of which is located the new government office. The honor guests at the luncheon were Senator David A. Reed and Congressman Stephen G. Porter, who assisted the Chamber of Commerce in securing for Pittsburgh this branch office of the Department of Commerce. Addresses were made by them and also by John Matthews, Jr., assistant director of the Bureau of Foreign and Domestic Commerce, who represented the head of that bureau, Dr. Julius Klein, who was prevented from attending by illness. Mr. Matthews explained how Pittsburgh district business men might take advantage of the direct facilities of the new office in finding purchasers for their products in both the domestic and foreign markets. Luther Becker, head of the iron and steel division of the bureau, and Walter S. Rastall, head of the industrial machinery division, were among the speakers. T. P. Gaylord, president of the Chamber of Commerce, introduced William L. Munro, president American Window Glass Machine Co., as toastmaster. Wilson K. Ray is in charge of the new branch.

Scrap Has Risen Sharply in Recent Weeks, Reaching the Highest Level in Two Years. Pig iron has recovered from the lowest point it has touched in almost 13 years and finished steel is still below the prevailing level of the past five years

Scrap Prices Recover in Third Quarter of Year

September Shows Highest Average in Nearly Two Years—Each 1928 Quarter Above the Previous One

AVERAGE prices of heavy melting steel scrap at Chicago, Philadelphia and Pittsburgh have recovered sharply from the weakness of the early summer and now stand at the highest point since October, 1926. The average on May 15 was \$14 a gross ton, which gave way to \$13.08 in early July. From that low point a steady advance brought the average to \$15.42 last week.

In spite of the low level in July, the average for the third quarter, at \$13.88, was the best for the year. It compares with \$13.74 in the second quarter and \$13.69 in the first. In

the third quarter of 1927 the composite was \$13.73 a ton.

Meantime, pig iron has recovered from the lowest level it had reached in more than 12 years. But the differential between THE IRON AGE pig iron composite at the end of September and the scrap average was less than \$3 a ton. This compares with more than \$6 a ton about two years ago.

Finished steel has had only slight fluctuations since early 1927. It declined during the second quarter to 2.341c. a lb. and still further in July, but now has come back to 2.362c. a lb. in the first week of October.

Comparative figures for 33 months, covering steel scrap, pig iron and finished steel, are given in the table. The diagram carries the story of these changing prices over a period of nearly five years.

Fox, traffic manager Highland Iron & Steel Co., Terre Haute; S. S. Shambaugh, traffic manager Continental Steel Corporation, Kokomo; George M. Field, traffic manager Chrysler Corporation, Newcastle, and T. L. Dairy, traffic manager Indiana Steel & Wire Co., Muncie.

Record Quarter in Automobiles

With a production of 460,000 cars and trucks in September indicated by preliminary estimates, the total for the third quarter of the year is brought to about 1,365,500, the largest quarter the automotive industry has ever had, says *Automotive Industries*. Total production in the first nine months is brought to approximately 3,687,000 as against 3,712,984 in the same period of 1926, the record production year. There is little question that output this month will exceed the 349,091 total in October, 1926, and that production in the rest of the year will carry 1928 to a new high record.

Overhead Conveyors in Wire Mill

An overhead system of conveyors will be installed in its wire mill by the Sheffield Steel Co., Kansas City. The equipment will include 10,200 ft. of tramrail, 14 tramrail cranes ranging from 500 lb. to 4000 lb. capacity, 5 cab controlled electric tramrail carriers, 200 hand power carriers, a gantry crane in the cleaning house over a straight row of tubs and a tramrail system in each baker in which the rods will be carried on hairpin hooks. The conveyor equipment will be supplied by the tramrail division of the Cleveland Crane & Engineering Co.

Indiana Opposes Abolition of Rate Groups

Exceptions to the proposed report of the Interstate Commerce Commission recommending a mileage basis for freight rates on iron and steel products in Official Classification territory will be filed with the commission by the Indiana State Chamber of Commerce as a result of a meeting of the chamber's special iron and steel committee held recently at Indianapolis. The committee declared that the adoption of the proposed mileage basis would abolish the present group system in the State and result in increases to shippers of about 18 per cent.

Members of the committee are H. S. McNeeley, traffic commissioner Indianapolis Chamber of Commerce; H. A. Holopeter, traffic manager Terre Haute Chamber of Commerce; L. R. Martin, traffic manager Oliver Chilled Plow Works, South Bend; John C.

Must Protect Buying Power of Wages

No More Important Task Today, Says Eugene G. Grace—
Employees' Cooperation Essential

AMERICAN industry faces no more important task today than to protect the buying power represented by wages, according to E. G. Grace, president Bethlehem Steel Corporation, in a letter on "Prosperity and High Wages," published in the *Bethlehem Review*, a news bulletin that goes to all Bethlehem employees. Mr. Grace points out that every year through conferences with employees' representatives Bethlehem makes a report to employees on matters of joint interest just as it reports to the stockholders at annual meetings. The conferences this year discussed as a matter of vital concern the necessity of maintaining the wage levels upon which American standards of living are based and the current issue of the *Review* is therefore devoted to some aspects of this important problem.

Mr. Grace says in his letter:

"In the last 10 years a new order has been created in our economic life. It is recognized, first, that high standards of living are based on the greater earning power of labor and, second, that continued prosperity and high wages go hand in hand.

"Progressive industrial management seeks, therefore, to enable employees to earn wages as high as can be paid. Even when profits decline or business falls off efforts are made to economize in other ways than by cutting wages. But management alone is powerless to maintain high wages. They can be paid only so long as economic conditions will permit them to be paid.

"One of the chief factors affecting this ability to pay them is foreign competition. With European wages far below American wages and consequently costs of production lower abroad, European manufacturers can compete on equal terms with the products of higher paid American labor.

"This fact vitally concerns every American worker. Naturally we are all interested in European progress, but economic improvement abroad can be accomplished without sacrificing American wages and living conditions. Foreign standards can be raised without reducing ours.

"Responsibility in part for protecting his wages rests upon the individual both as an employee and as a citizen.

"As a wage earner his responsibility is to help increase production and reduce costs so that his own company can meet competition, sell its products at a profit and thus continue to pay the highest possible wage. Paying men on the basis of individual merit is one way to increase wages and reduce costs.

"As a citizen the employee's responsibility is to take an active, intelligent interest in company and public affairs. We have reached a point in this country today where thousands of employees are also stockholders, with both a payroll and company interest in continued prosperity.

"Certain it is, therefore, that as wage earners, stockholders and citizens our outstanding interest is an economic one. If we are mindful of that fact and act accordingly we shall cooperate with each other to promote

our company's prosperity and see to it that nothing is done to disturb American living standards which have taken us so many years of hard work to establish."

The *Review* points out that steel industry wages generally are higher than wages paid in most of the manufacturing lines. Based on data compiled by the National Industrial Con-

Cooperation in Making Electric Steel Castings

"Competitors Who Have Cooperated to Improve Quality" is the title of a 31-page pamphlet just published by the Electric Steel Founders' Research Group, Chicago, of which R. A. Bull is director. It takes the place of the regular October issue of *Research Group News*, and is to be distributed at the National Metal Exposition in Philadelphia, Oct. 8 to 12, where the group is to display products of its five electric steel casting plants. The pamphlet contains a short history and photographs of the various plants making up the organization and reference matter concerning the products. Specifications, heat-treatment practice and similar data, customarily found in handbooks, are also included.

September Ore Shipments Gain, Year's Total Lower

Iron ore shipments from the Lake Superior region during September amounted to 8,748,286 gross tons, an increase of 1,518,245 tons, or 21 per cent, compared with the 7,230,041 shipped from upper Lake ports in September, 1927. The total for the season to Oct. 1, 41,265,979 tons, de-

ference Board, it is stated that wages in terms of average weekly earnings in the iron and steel industry for June—and this is typical of other monthly comparisons—were higher than the wages paid in any of 20 major industries except two. They were 24 per cent higher than the average of all. The iron and steel industry has a relatively larger number of continuous operations, but in spite of this fact the average weekly working time was only approximately 10 per cent greater in the iron and steel industry than the average weekly working time for all of the industries reported.

Comparisons are also made between American and foreign wages. In this connection the *Review* states:

"Because American workmen produce more and are paid higher wages, the standards of living in the United States are higher than those of any other country. Mass production and labor-saving devices are far ahead of foreign competitors. This means simply that the American employee creates more value by his work than European workers."

clined 1,117,978 tons, or 2.64 per cent, compared with the 42,383,957 tons shipped to Oct. 1, 1927. The table gives the shipments for September and for the season in 1928 and 1927 in gross tons.

Establishes Manly Medal

To commemorate the work of Charles M. Manly in the fields of automotive and aeronautic engineering and to serve as an inspiration to others, the Society of Automotive Engineers is establishing a Manly memorial medal to be awarded annually for the best paper on aeronautical power plant, part or accessory design, construction or research, presented at a meeting of the society or one of its sections during the year.

An outstanding accomplishment of Mr. Manly, who died last October, was the designing and building, 30 years ago, of a gasoline engine for the flying machine built experimentally by Prof. S. P. Langley, secretary of the Smithsonian Institution. This was a five-cylinder radial engine that weighed only 2.4 lb. per hp. developed, although no builder had previously been able to construct an engine weighing less than 12 lb. per hp. and no builder subsequently equalled Mr. Manly's accomplishment until the 400-hp. Liberty-12 engine was built.

Exceptionally High Ingot Production Was Recorded in September. On the basis of daily averages, only three previous months have bettered it—March, 1927, and March and April, 1928. Prices were fractionally better than at midyear

Largest September Steel Ingot Production

Output Larger Than in Any Month of Any Second Half, Except August, 1928—Nine-Month Figure a Record

PRODUCTION in September of open-hearth and Bessemer steel ingots in the United States as reported to the American Iron and Steel Institute, was less than 1 per cent under the total for August, in spite of having only 25 nominal working days, against 27. Last year the shrinkage from August was 6½ per cent on a reduction of one day. Not only was the September tonnage the largest ever produced in any September, but it was, with the exception of the preceding month, by far the largest for any month in any second half-year. It is calculated at 4,147,583 gross tons.

On the basis of 25 working days, the output was 165,903 tons a day. This is the highest figure since the record-breaking total of last April. It is 32 per cent above the 125,726 tons of September, 1927, and is the highest daily rate ever reached in a second-half month. Output in August was given as 154,759 tons a day.

For the nine months of the year to date, the calculated production has been 36,930,520 tons. This exceeds by about 1,240,000 tons the previous

high record for the first nine months, which was that of 1926, when 35,689,151 tons was produced. That tonnage included also crucible and electric ingots, which are not covered in the current figures. If we estimate 300,000 tons for that group in the first nine months of 1928, the total production would approach 37,250,000 tons, or more than 1,500,000 tons ahead of the previous record. Compared with last year, when the output in nine months was 33,778,952 tons, this year's production has shown a gain of more than 9.3 per cent.

Open-hearth steel made in 25 days in September was almost equal to that made in 27 days of August. Practically all of the shrinkage of 31,000 tons between the two months was in the Bessemer grade, which dropped 24,421 tons, or 4.3 per cent. Bessemer steel in September formed 13.9 per cent of the total steel reported. In the nine months, Bessemer steel made a gain of 3.9 per cent over 1927, compared with 10.3 per cent for open-hearth steel.

Total ingot production, including crucible and electric steel ingots, was

probably 1000 tons greater daily than the figure given. This would make the daily average for the month about 167,000 tons. Details of the first nine months of 1927 and of 1928 are covered in the table.

To Detect Rail Fissures

Invisible transverse fissures, starting from within the structure of steel rails and working outward, giving no warning until the rail breaks in service, are to be sought by a new electrical device invented by Elmer A. Sperry and announced by the American Railway Association. A small covered car containing the instruments is drawn along the track at 7 or 8 miles an hour. Electric connections provide a magnetic field within which is the rail. The faint impulse is magnified several thousand times when a fissure is met, resulting in sending a squirt of white paint against the rail. The paint marks are danger signals, calling for replacement of the rails so designated.

Doctor Hatfield Talks on Resistance to Corrosion

At the October meeting of the Hartford, Conn., chapter of the American Society for Steel Treating, held Oct. 2, a large attendance heard Dr. W. H. Hatfield, director of the Brown Firth Research Laboratories at Sheffield, England, and also the Campbell Memorial lecturer at the national convention. He addressed his first American audience at Hartford, his subject being: "Acid, Corrosion and Heat-Resistant Steels." He developed his subject by showing numerous slides, which exhibited a vast amount of experimental work on the effects of corrosion upon different steels.

He held that a thin oxide film only a few molecules thick is responsible for resistance to corrosion. He cited Ulick Evans's clever experiment in separating the iron from the oxide film, leaving the film floating about in solution like the finest gossamer. In another experiment Doctor Hatfield showed that a common mild steel plate, when polished and exposed to the weather but protected by a gauze in front of the polished face, remains bright and uncorroded for many months. He explained this by reasoning that the oxide film on ordinary steel is very liable to mechanical injury. Protection from all particles of dust and dirt insures that no injury to the film takes place and, therefore, no nucleus for corrosion is available. The oxide film on high-chromium and high-chromium-nickel steels is very tenacious and mechanically strong.

Doctor Hatfield showed in a tabular way the results of corrosion tests performed under standard conditions on a series of steels with varying chromium content, on another series of chromium-nickel steels with the nickel content constant, and another series with the nickel varying and chromium

constant. A great advantage in general corrosion properties is gained by adding nickel to chromium steels, the 18 per cent chromium, 8 per cent nickel proving an excellent type for general corrosion-resisting properties.

For any specific case in acid-resistant applications a certain steel can be found to "do the job." Stainless steel for resisting corrosion of superheated steam at 1000 deg. Fahr. is applied in turbine blading and valve parts. A chrome-nickel-silicon steel is useful in applications where a high tensile strength is necessary at an elevated temperature, such as 700 to 800 deg. C. At this temperature, it has the strength of mild steel at room temperature, and the non-scaling properties of this steel are excellent.

Carriers Submit Plan for Interterritorial Rates

A memorandum regarding joint through class rates between Western Trunk Line and Official Classification territories has been submitted to the Interstate Commerce Commission on behalf of carriers operating in those territories, in response to a communication from Commissioner McManamy, requesting the carriers to "advise the commission as to the most practical plan for overhead rates not based on gateway combinations, if finally determined upon, and as to the classification which should govern them. It will be understood," the letter further stated, "that evidence of that nature introduced by the carriers is without prejudice to their position that combinations afford the proper basis."

This memorandum is in no sense a brief and it is confined to an outline of a suggested plan with necessary explanation, but without any argument for or against the plan. It con-

templates joint through class rates between Western and Official Classification territories including points on the Missouri River to be determined by the use of a distance scale. It also suggests that the rates should not be published as distance rates, but that the distance scale be used in determining the rates in much the same manner as proposed by the Western Trunk Line carriers in connection with their basic scale within that territory. It is further recommended that rates resulting from the message outlined in this memorandum shall be the same in both directions. The plan also contends that without relief from the long-and-short-haul provisions of the fourth section any distance basis is immediately defeated and rates result which are lower than those prescribed.

The plan contemplates the application of the Western classification in connection with its adjusted rates, which is in harmony with the suggestions made with respect to interterritorial rates between Western Trunk Line and Southern territories. If this plan should be adopted all rates within this territory and to and from Western Trunk Line territory would be governed by the Western classification.

Eastern Pipe Makers Protest Proposed Rate Changes

WASHINGTON, Oct. 9.—Exceptions to the proposed report of Examiners Howard C. Faul and C. M. Bardwell, in connection with the rate structure on iron and steel products throughout Official Classification territory, were filed last week with the Interstate Commerce Commission by the Eastern Cast Iron Pipe Producers, New York, who asked the commission to dispose of pending cast iron pipe rate cases. It was contended that foundries within the Philadelphia group are being discriminated against and are in need of immediate relief. The protest against the Faul-Bardwell report was based on the fact that it did not treat the cast iron pipe rate situation, and declared that to do so would disrupt "what seems to be a satisfactory competitive adjustment." The protesting interests said that the pipe plant at Scottsdale, Pa., had the benefit of specific commodity rates to 88 points of consumption, that the Birmingham, Ala., district had specific commodity rates to 80 per cent of these destinations and that Philadelphia had such rates to only 15 per cent of the destinations.
